inclined to submit peaceably to oppression) from voting or holding office, or being witnesses in criminal suits. The establishment of and taxation for the Church of England was a common grievance to all the colony, nearly all its population being dissenters; and there were other obnoxious ordinances. At this time Albermarle County (North Carolina) had its separate deputy-governor, appointed by the governor of the entire colony; and in 1704 Sir Nathaniel Johnson so appointed Robert Daniel, a churchman, and "landgrave" or hereditary noble and counselor. He tried to enforce the laws; and one John Porter, an influential Quaker, shortly went to England to complain of him and of vexatious legislation against his sect. One of the proprietors, John Archdale (q.v.), ex-governor, was himself a Quaker, and induced the other proprietors to remove Daniel; and Johnson appointed Thomas Cary, a Carolina merchant, said to have been Archdale's son-in-law, in his place. Cary, however, felt bound to enforce the laws, and again the Quakers complained. Cary was removed (the accepted account says he was in ill odor with the proprietors for having been short in his accounts as collector of revenue for them); and this time the appointment of a deputy for Albermarle was taken from the governor, and a new proprietary council formed, with Porter and several other Quakers on it. On Porter's return to America in 1707, he convened the council, which elected William Glover, a churchman, president. Glover insisted on enforcement of the laws as before, and Porter's party turned against him, declared his election illegal, struck a bargain with Cary, and elected him president in Glover's place. Glover and his section refused to recognize the validity of the new election, and held their meetings in one room of the executive mansion, while Cary and his councilors met in the other. Daniel, as a landgrave, was *ipso facto* a counselor, and sat alternately in both. Each party issued writs for election to the Assembly, and it seems to have been held without formal recognition of either; but Cary's party held the majority. In 1710 Edward Hyde, a relative of Clarendon's, was appointed deputy-governor by the proprietors, and came out in August 1710 to assume office. His commission was to be taken from Tynte, who had succeeded Johnson; but Tynte had died, and Hyde had only his letters from the proprietors to show. The Cary party, however, was glad to acknowledge him so long as it held the power and he confirmed it; but the next Assembly was held by its enemies. Hyde apparently aided it in enforcing the laws in favor of the Church, and Cary's party promptly refused to acknowledge his authority and made open war on him. Cary attacked Edenton with two armed vessels, but was repulsed, and Hyde called on Gov. Spotswood of Virginia for help. Spotswood admitted that the revolt was "dangerous incendiaries," but said the country was almost inaccessible, and he had only militia; but finally sent some of his marines from the guard-ships at Hampton Roads. Cary, with his chief men, Levy, Truitt, etc., thereupon went to Virginia, apparently for temporary refuge, declaring that they would go to England and appeal to the proprietors. Spotswood took them at their word, and sent them, seemingly against their will, to England; and they disappear from history. That they

CARYA — CASABIANCA

were discharged, however, is apparent from a circular letter of Lord Dartmouth to the colonies, at this juncture, to send no more prisoners to England for trial without proof of their guilt. At home, the burgesses refused to provide for the defense of the colony unless they could have share in the government and what they held to be their rights; and the result was a fearful desolation in a war which soon broke out with the Tuscaroras.

Ca'rya, a genus of American plants belonging to the order *Juglandacea*. *C. alba* is the common hickory. The seeds of *C. amara*, with oil of chamomile, are useful in colic. See HICKORY.

Caryatides, or **Caryatids**, *kār-ī-āt'ī-dēz*, in architecture, a name used to designate female figures made to support a roof, cornice, etc., instead of columns. The goddess Artemis (*Diana*), who had a temple in Caryæ, a Peloponnesian city, was for this reason called *Karyatis*. In honor of her, virgins danced in a festive procession during an annual feast, which suggested to architects the idea of adopting the images of virgins to serve as columns. Thus Lessing and others explain the name and form of the caryatides. Another explanation of their origin is the following: The inhabitants of Caryæ allied themselves with the Persians in their war with the Greeks. The Greeks, on the successful termination of that struggle, exterminated the males of Caryæ, and reduced all the women to slavery. As a mark of infamy, and to perpetuate the memory of the transaction, the architects of the time made statues representing these women in the servile office of supporting entablatures. Both explanations are somewhat doubtful.

Caryocar, *kā-rī'ō-kār*, a genus of plants belonging to the natural order *Ternstramiaceæ*, consisting of lofty trees, natives of tropical America, which produce good timber. They have evergreen, ternate or pinnate leaves, and flowers in racemes. *C. nuciferum*, a species abundant in British Guiana, yields the kidney-shaped souari-nuts, or butternuts. Other species are *C. glabrum* and *C. amygdaliferum*.

Caryophyllaceæ, *kār-ī-ō-fī-lā'se-ē*, an order of plants, of which the pink, named by botanists in early times *Caryophyllus*, and more recently *Dianthus*, may be considered as the type. The plants of this order are readily distinguished by their opposite undivided leaves, without stipules, the tumid articulations of the stems, and the disposal of the seeds upon a free central placenta, surrounded by several carpellary leaves. Several species are cultivated by florists; a few are used in medicine, and the *Saponaria officinalis* and *Lychnis diurna* yield a mucilage resembling soap. The Clove-pink (*Dianthus caryophyllus*) is the origin of all the cultivated varieties of carnations, picotees, bizarres, flakes, etc. There are about 60 genera and 1,100 species.

Caryop'sis, the small peculiar, one-seeded, dry indehiscent fruit of the grasses, as wheat, barley, etc.

Caryo'ta, a genus of palms, with doubly pinnate leaves, the best-known species of which (*C. urens*) is a native of most of tropical Asia; it supplies an inferior kind of sago, and from its juice is made toddy or palm-wine. The leaf-

stalks yield kittul fibre, which is used in making baskets, brooms, etc.

Ca'rysfort Reef, a coral reef near the southern extremity of Florida, on which is erected a lighthouse of the first order, 112 feet high.

Casa, Giovanni della, *jō-vān'nē dēl'la kā-zā*, Italian writer: b. Mugello, near Florence, 1503; d. Rome, 14 Nov. 1566. He studied in Bologna, Florence, and Rome, and entered as an ecclesiastic into the service of the two cardinals Alessandro Farnese, the first of whom, in 1534, ascended the papal chair, under the name of Paul III. He rose through various offices in the Church, including the archbishopric of Benevento, till Paul IV. made him his private secretary. His most celebrated work is 'Galateo, ovvero de' Costumi' (1560), a manual of good-breeding, to which another book, 'Degli Uffizj communi tra gli Amici Superiori e Inferiori,' forms a supplement. This last is a translation of his Latin treatise, 'De Officiis Inter Potentiores et Tenuiores Amicos.' The best and most complete edition of his works appeared at Venice (1752).

Casa Braccio, *brāch'ō*, Italian romance, by Francis Marion Crawford, published 1896. The first half of the novel is much the better.

Casa Grande, *kā'za grān'dā*, the ruins of a prehistoric building in Arizona, near the Gila River, within 20 miles of the Casa Grande station. Built of adobe with walls, in some places five feet thick at the base, narrowing toward the top, it is the best-preserved structure of a type which was probably widely distributed. The space enclosed by the walls now standing measures about 43 by 59 feet; and the walls, which are high, show that there were three, and perhaps four, stories. There are three central rooms and two end rooms. A large area surrounding this building is covered with mounds and debris of other buildings, indicating that there was originally a considerable settlement on the site. It was built by a Pueblo or allied race, and the evidence is in favor of the theory that they were the ancestors of the Pima Indians who now inhabit the region. In 1889 Congress made an appropriation for the preservation and repair of the Casa Grande, and the whole area has been made government property. During the removal of the debris a number of specimens of pottery and stone implements have been found. The ruins were seen by Coronado's expedition and mentioned by Catafieda; they were carefully described by Father Menge, who, with Father Pinto, visited them in 1694 and 1697. John R. Bartlett was the first to give a detailed description of them in modern times in his 'Personal Narrative of Explorations and Incidents in Texas, New Mexico, California, Sonora, and Chihuahua' (1849). The best and most recent accounts are found in the publications of the Bureau of American Ethnology (13th and 15th annual reports).

Casabianca, Louis, *loo ē kā-zā-bē-ān-kā*, French naval officer: b. Bastia, Corsica, about 1755; d. 1 Aug. 1798. He sat in the National Convention of 1792; and in 1798 was captain of the flagship L'Orient in the expedition to Egypt. He was mortally wounded at the battle of the Nile. 1 Aug. 1798; the ship caught fire; his 10-year-old son would not leave him, and both were killed by the exploding of the ship. The story

CASAL — CASAS

of their death is the subject of Mrs. Hemans' well-known poem.

Casal, or **Cazal**, **Manuel Ayres de**, mā'noo-ēl ī'rēz dā kā-sal', Portuguese geographer: b. in the last half of the 18th century; d. Lisbon about 1850. Having received an excellent education, he took holy orders, but afterward devoted himself to the exploration of Brazil. He has been styled the father of Brazilian geography, and his principal work, entitled 'Corografia Brasilica' (1817), elicited the admiration of Humboldt and of other competent judges.

Casale, or **Casale de Monferrato**, kā sā lā mōn-fēr-rā'tō, Italy, a city in the province of Alessandria, on the right bank of the Po, 18 miles north-northwest of Alessandria. The citadel, founded by Duke Vicenzo in 1590, was one of the strongest in Italy, but its ramparts have been converted into promenades, and its defenses are now insignificant. In 1640 the Spaniards were defeated here by the Duc d'Har-court, and the possession of the town was repeatedly contested by the Austrians and French during the wars of Napoleon. Casale was the capital of the ancient Montferrat. It is the seat of a bishop and of a district court of justice, and has a cathedral which is said to have been founded in the 8th century. Its church of San Domenico, containing a tomb in memory of the Princess Palæologi, is remarkable for the elegance of its design, and several fine works of art are found in other of its churches. Among the prominent articles of trade are silk, and sirup manufactured from the roots of a species of reed. Pop. about 32,000.

Casale Pusterlengo, kā-sā'lā pūs-tēr-lēn'-gō, Italy, a town in the province of Milan, southeast of Lodi, beautifully situated in a fine plain between the Po and the Adda. It has a trade in Parmesan cheese. In 1796 the Austrians were attacked here by the French, and driven back to Lodi. Pop. 6,304.

Casalmaggiore, kā-sāl-mād-jō rē, Italy, a town in the province of Cremona, and 22 miles southeast of the city of Cremona (with which there is railway connection), on the left bank of the Po. There are a cathedral and other churches, theatre, etc. The manufactures include pottery and glass-ware; and there is a trade in wine, grain, hemp, and cheese. In 1448 the Venetians were defeated here by Francesco Sforza. Pop. 15,648.

Casamicciola, kā-sā-mē'chō-lā, Italy, a favorite watering-place on the island of Ischia, beautifully situated in a valley on the north side of Monte Epomeo, with hot springs (158° F.), baths, hotels, etc. The season extends from June to September. By the earthquake of 28 July 1883, the place was almost entirely destroyed.

Casanare, kā-zā-nā'rē, a river of the Republic of Colombia, which flows through a region called by the same name, and after an easterly course of 180 miles empties into the Meta.

Casanova, **Francesco**, frān-chēs'kō kā-sā-nō'vā, Italian painter: b. London 1730; d. Brühl, near Vienna, 1805. He went to Venice with his parents, was in Paris in 1751, but after a brief stay went to Dresden, where he remained from 1752 to 1756. Here he studied and copied the paintings of Wouverman. He acquired renown as a painter of battle pieces, and

was admitted to the Academy of Fine Arts in 1763. Catherine II. of Russia employed him to paint her victories over the Turks. He settled in Vienna in 1785, and the gallery there contains several of his paintings.

Casanova de Seingalt, **Giovanni Jacopo**, jō-vān'nē ya'kō pō kā-sā-nō'vā dē sān-gāl, Italian adventurer: b. Venice 1825; d. Dux, Bohemia, 4 June 1798. He was the son of an actor and actress; he studied law at Padua, but gave this up to study for the priesthood. He was expelled from the Seminary of St. Cyprian for a scandalous intrigue, and was also imprisoned for a short time. The influence of his mother procured him a place in the establishment of Cardinal Aquaviva, but he did not retain it long; and after visiting Rome, Naples, Corfu, and Constantinople, in the characters of diplomatist, preacher, abbot, lawyer, and charlatan, he was imprisoned at Venice in 1755, but escaped owing to his wonderful keenness and skill. In his travels throughout Europe he formed associations with many distinguished characters, Louis XV., Rousseau, Voltaire, Suv-aroff, Frederick the Great, and Catherine II. His most celebrated work is his 'Memoirs' (1828-38), in which he relates with a cynical freedom the whole of his extraordinary adventures, and presents a picture of society without conventional disguise. Among his dupes were Mme. de Pompadour, Frederick the Great, and even that other prince of charlatans, Cagliostro. Besides his 'Memoirs,' Casanova was the author of several works of history or imagination in French and Italian, which show the versatility of his genius. The most remarkable are 'Recit de sa Captivité' (1788), and a translation in verse of the Iliad.

Casas, **Bartolomé de las**, bār-tō'lō-mā dā lās kā'sas, Spanish prelate: b. Seville 1474; d. Madrid July 1566. In his 10th year he accompanied his father, who sailed with Columbus, to the West Indies. Five years afterward he returned to Spain, and pursuing his studies he entered the priesthood. He accompanied Columbus in his second voyage to Hispaniola (Haiti), and on the conquest of Cuba settled there, and distinguished himself by his humane conduct toward the oppressed natives. He set at liberty the Indians who had fallen to his share in the division; and so much was he interested for them, that in 1516 he went to Spain to lay a statement of their case before King Ferdinand, whose death at that time prevented any measures for their benefit. The regent, Cardinal Ximenes, however, appointed a commission to examine circumstances on the spot, and to determine accordingly. Las Casas was to accompany them, with the title of Protector of the Indians. The commissioners found that it was impossible to liberate the Indians, and therefore endeavored to secure their humane treatment; but Las Casas, still dissatisfied, remonstrated so warmly that he was obliged to take refuge in a convent from the rage of the planters. He again returned to Europe; and on the accession of Charles V., in consequence of his representations, the council appointed a chief judge to re-examine the points of controversy between the partisans of Indian liberty and the colonists. Las Casas, in his zeal for the Indians, became the author (or the encourager at least) of the slave-trade, by proposing to pur-

CASAS GRANDES — CASATI

chase negroes from the Portuguese in Africa to supply the planters with laborers, of the want of whom they complained; and this was unfortunately put into execution. He next applied for a grant of an unoccupied tract, in order to try his own plan with a new colony. This he at length obtained, and with 200 persons, whom he persuaded to accompany him, landed at Porto Rico in 1521, but found that an expedition was advancing to ravage this very tract, and convey its inhabitants to Hispaniola as slaves. He endeavored in vain to prevent the threatened danger, and with the few who still adhered to him returned to Hispaniola to solicit succor. During his absence the natives attacked the colonists with such success that in a short time not a Spaniard remained in that part of South America. Las Casas, in despair at the failure of his project, retired to the Dominican convent at St. Domingo, and assumed the habit of the order. Notwithstanding his retirement his zeal in the cause of the Indians did not abate; and being sent on a mission to Spain by a chapter of his order at Chiapas in 1542, he pleaded their cause with his pristine warmth, and composed his famous treatise '*Brevisima Relacion de la Destruccion de las Indias*,' in which he exposed the cruelties practised by the Spaniards. His unremitting perseverance at length obtained a new set of laws and regulations, by which the natives were greatly relieved. In 1544 he returned to America as bishop of Chiapas, but left it three years later, and resigned his bishopric in 1550. Besides the treatise above named he wrote '*Historia de las Indias*.' This was first printed in 1875-6. It is one of the most notable of books, not only in its contents,—as a history of Spanish discoveries from 1492 to 1520, and a contemporary Spanish Catholic criticism as well as story of Columbus,—but in the circumstances which prevented its publication for more than 300 years, and which still leave it inaccessible except to readers of Spanish. See Llorente, '*Œuvres de las Casas*' (1822); Quintana, '*Vidas de Españoles Celebres*'; Helps, '*Life of Las Casas and Spanish Conquest*' (1868); Fabie, '*Vida y Escritas de Las Casas*' (1879); Sabin, '*Works of Las Casas*' (1870).

Casas Grandes, kă'sās grăn'dās (Span. "great houses"), a town in Chihuahua, Mexico, on the Casas Grandes or San Miguel River, 35 miles south of Llanos, and 125 miles southwest of El Paso, remarkable for a number of ruins, apparently relics of an aboriginal race. These ruins are found about half a mile from the small Mexican village, partly on the declivity of a small hill, and partly on the plain at its foot. They consist chiefly of the remains of a large edifice of the pueblo type, built entirely of a substance resembling adobe, mud mixed with gravel and straw and formed into blocks 22 inches thick and about three feet long. The portions which must have been constructed of wood have entirely crumbled away. The outer walls are almost all prostrate, except at the corners, and were probably only one story high; the inner walls are better preserved, varying in height from 5 to 50 feet, and being in some cases five feet thick at the base. The portions remaining erect seem to indicate an original height of from three to six stories. The doorways have the tapering form noticed in the ancient structures of Central America and Yucatan, and over them

are circular openings in the partition walls. The stairways were probably of wood, and placed on the outside. Clavigero, in his '*History of Mexico*,' tells us that the building, according to popular tradition, was erected by the Mexicans in their peregrination, and that it consisted "of three floors, with a terrace above them, and without any entrance to the lower floor. The door for entrance to the building is on the second floor, so that a scaling ladder is necessary." The main features of the edifice seem to have been three large structures connected by ranges of corridors or low apartments, and enclosing several courtyards of various dimensions. The extent from north to south must have been 800 feet, and from east to west about 250 feet. A range of narrow rooms lighted by circular openings near the top, and having pens or enclosures three or four feet high in one corner, supposed to be granaries, extends along one of the main walls. Many of the apartments are very large, and some of the enclosures are too vast ever to have been covered by a roof. About 200 feet west of the main building are three mounds of loose stones and 200 feet west of these are the remains of a building, one story high and 150 feet square, consisting of a number of apartments ranged around a square court. The inhabitants of this communal structure seem to have disappeared long before the Spaniards noticed the ruins in the latter part of the 17th century. Throughout the northern part of Mexico the name Casas Grandes is applied to deserted buildings of a similar type.

For some distance south the plain is covered with tracts of ancient buildings, and for 20 leagues along the Casas Grandes and Llanos rivers are found artificial mounds from which have been dug up stone axes, corn-grinders, and various articles of pottery, such as pipes, jars, pitchers, etc., of a texture far superior to that made by the Mexicans of the present day, and generally ornamented with angular figures of blue, red, brown, and black, on a red or white ground. The best specimens command a high price in Chihuahua and neighboring towns. On the summit of a mountain, about 10 miles from the ruins above described, are the remains of an ancient stone fortress, attributed to the same people who built the Casas Grandes, and probably intended as a lookout. See PUEBLOS.

Casati, Gaetano, gā-ā-tā'nō kă sāt'ē, Italian explorer in Africa: b. Monza, Italy, 1830; d. Como 7 March 1902. He entered the army of Piedmont at 21, and resigning in 1879 went to Africa, commissioned by the Società d'Esplorazione Commerciale d'Africa. He joined his countryman, Gessi Pasha, in the Bahr-el-Gazelle valley, but the schemes of the Mahdi in 1883 shut him up in the Niam-Niam region with Emin Pasha. At the request of the latter he consented to act as "President" in King Kabba Rega's country, but after being at first well treated by that monarch he was later condemned to death. Escaping with great difficulty to the Albert Nyanza Lake, and losing all his notes and manuscripts, he was finally rescued by Emin Pasha in 1888. The expedition of Stanley came a little later to the relief of both. On his return to Italy Casati published a volume descriptive of his adventures, entitled '*Dieci anni in Equatoria*.'

CASAUBON — CASE

Casaubon, Isaac, ē-zāk kā-zō-bôn, Swiss classical scholar: b. Geneva 18 Feb. 1559; d. London 12 July 1614. In his ninth year he spoke Latin fluently. In his 19th year he entered the university at Geneva, where he studied Greek, theology, the Oriental languages, etc., and in 1582 succeeded Portus as professor of the Greek language. In 1586 he married the daughter of the famous printer Henry Stephens. In 1596 he accepted a professorship of Greek and belles-lettres at Montpellier, but held it only two years. In 1600 Henry IV. invited him to Paris. His Protestantism, the jealousy of other scholars, and perhaps his rather unyielding character, were the occasion of many unpleasant occurrences, for which, however, he was indemnified by the office of royal librarian. After the death of Henry IV. in 1610 he went to England on the invitation of the Archbishop of Canterbury, where he was received with distinction, was presented with a prebend in Canterbury Cathedral, and had a pension conferred on him by James I., with whom he was a great favorite. He was buried in Westminster Abbey. Casaubon was a liberal theologian, a man of extensive learning, a good translator, and an excellent critic. As a critic, he commented on Diogenes, Laertius, Aristotle, Theophrastus, Suetonius, Persius, Polybius, Theocritus, Strabo, Dionysius of Halicarnassus, Athenæus, Pliny the Younger, etc. Nearly all the ancient classics are indebted to his valuable researches. His profound dissertation on the satirical poetry of the Greeks and the satire of the Romans ('De Satyrica Græcorum Poesi et Romanorum Satyra') deserves particular praise. His theological writings are of less value. His diary, which had been preserved by his son, Meric, was published in 1850 under the title of 'Ephemerides.' An admirable 'Life of Casaubon' has been written by Mark Pattison' (1875).

Casaubon, Meric, son of the preceding, Swiss classical scholar in England: b. Geneva 14 Aug. 1599; d. Oxford 14 July 1671. He went to school at Sedan, and in 1611 followed his father to England, and studied at Eton and Christ Church, Oxford. He held successively several livings in the Church, when the revolution, which brought Charles I. to the scaffold, deprived him of his income. Still he rejected the proposal of Cromwell to write the history of his time, as also the invitation of Queen Christina to live in Sweden. On the return of the Stuarts he was rewarded for his loyalty by restoration to his offices in the Church, which he held till his death. Besides various works in Latin, he wrote several in English on theological and other subjects. He also wrote some critical works on the classics, a treatise, 'De Verborum Usu' (1647); etc.

Casbin. See KASBIN.

Casca, Publius Servilius, Roman conspirator: d. 42 B.C. He assisted in the assassination of Julius Cæsar in 44 B.C., and according to Plutarch, he struck the first blow, in the back of the neck.

Cascade Range, a range of mountains in North America, parallel to and about 120 miles from the Pacific coast, extending from the Sierra Nevada in California northward through Oregon and Washington into British Columbia. The highest peaks are Mount Rainier in Washington,

14,526 feet, and Mount Shasta in California, 14,440 feet. The name is derived from the cascades formed by the Columbia River in breaking through the range.

Cascade'iac River, Great, a river of Canada, in the province of Quebec, flowing south-east into Chaleur Bay. Its length is 150 miles.

Cascapediac River, Little, a river of Canada, in the province of Quebec, east of the Great Cascapediac and with an almost parallel but shorter course.

Cascara Sagrada, the bark of a northwestern tree (*Rhamnus Purshiana*, or California buckthorn), of the natural order *Rhamnaceæ*. The composition of cascara is extremely complex, but its main action is due to the volatile oils, the anthracene resins, at least three, the amaroids, and the tannin. It stimulates peristalsis, increases the intestinal juices, and has marked effects on general excretion. It is an excellent laxative, and one of the very best cathartics for habitual and chronic constipation. It is best used in the form of a fluid extract. Because of its valuable properties, many patent drugs with similarly sounding names have been foisted on the public. These mostly contain other and more powerful and pernicious cathartics. See BUCKTHORN; RHAMNUS.

Cascarilla, the bark of a tree (*Croton eleuteria*), of the family *Euphorbiacæ*. This is a shrub of the Bahamas and now yields most of the cascarilla of commerce, although in former years other species were used. It contains tannic acid, volatile oils, cascarillin, a glycoside, and some resin. In medicine it is used as an aromatic bitter in combination with other remedies for constipation, indigestion, and loss of appetite.

Cas'co Bay, a bay on the southwest coast of Maine. It is about 20 miles wide and so deep as to constitute one of the best harbors of the world, for all kinds of vessels. It contains many islands.

Case, Augustus Ludlow, American naval officer: b. Newburg, N. Y., 3 Feb. 1813; d. Washington, D. C., 17 Feb. 1893. He entered the navy as a midshipman in 1828. In the Mexican war he took part in the capture of Vera Cruz and Tobasco, and during the Civil War served as fleet-captain of the North Atlantic blockading squadron. He took part in the capture of Forts Hatteras and Clark, and cut out the blockade-runner Kate, under the fire of the forts at New Inlet, N. C. He was a lighthouse inspector in 1867; chief of bureau of ordnance, 1869; commander of the European squadron in 1873; and was retired in 1875.

Case, Leonard, American philanthropist: b. Cleveland 27 June 1820; d. 6 Jan. 1880. He graduated at Yale College in 1842, and continued to pursue literary and scientific studies, contributing to the best magazines. Inheriting from his father a large estate in the city of Cleveland, he deeded a certain part of it for the founding and maintenance of an educational institution, which was incorporated after his death as the Case School of Applied Science (q.v.).

Case, Thomas, English philosophical scholar. He was educated at Rugby, and Balliol College, Oxford, and has been Wsynflete professor of moral and metaphysical philosophy at

Oxford from 1889. He has published 'Materials for History of Athenian Democracy from Solon to Pericles' (1874); 'Realism in Morals' (1877); 'Physical Realism' (1888); 'St. Mary's Clusters' (1893).

Case, in grammar, a form, modification, or inflection of a noun or pronoun, indicating or corresponding to its relationship to some other word or words in a phrase or sentence, as, John (nominative case) speaks; John's (possessive) dog barks; John beats his dog (objective). In adjectives, case is merely sympathetic, the adjective agreeing in case with the noun which it qualifies. In English, nouns undergo only one inflection representing a different case from the nominative or general form of the noun; all other cases are represented either by prepositions or by the position of the noun in the sentence, the nominative case usually preceding the verb, the objective or accusative following it. The single inflected case in English is the possessive or genitive (John's). English pronouns have three cases—nominative, genitive, and accusative, as *he*, *his*, *him*. The last often serves as a dative. Adjectives undergo no modifications in English. In Sanskrit there are eight cases—nominative, accusative, instrumental, dative, genitive, ablative, locative, and vocative. In Latin there are six cases—nominative, genitive, dative, accusative, vocative, ablative. In Greek there are five, the ablative not being used. In both Latin and Greek there are traces of a locative case. In French, Italian, Spanish, and Portuguese, the nouns have no case-inflections. In German both nouns and adjectives are inflected for case. There are four cases in German—nominative, genitive, dative, accusative.

In law, the word has various meanings. An "action upon the case" is one in which damages are sued for, for some cause of complaint where the injury done is not direct, as in trespass, but consequential. A "case stated" is a statement prepared by one court for the decision of a point of law by a superior court. A "special case" is a written statement of facts agreed on by two or more litigants in an action, in order that a court may decide their legal effect.

In letter-press printing, a case is a receptacle for types, generally made of wood, 34 inches long, 15 inches wide, and 1¼ inches deep, and divided into compartments or "boxes," each of which contains types of one class or letter. A pair of cases consists of an upper and a lower case; the upper one has 98 boxes, and contains the capitals, small capitals, and some other signs that are only occasionally required in composition; the lower one has 54 boxes, and holds the letters of the small characters, figures, spaces, and most of the points. Thus the small characters are habitually spoken of by printers as "lower-case" letters, and the capitals, etc., as "upper-case" letters. The places assigned to the several letters of the alphabet in the boxes of the case are not precisely the same in all printing-offices, but the differences are few. The different sizes of the boxes in the lower case depend upon the comparative frequency with which the several letters occur in the composition, and the position in the case allotted to each letter is such as to afford the greatest facility in composing. The letter *e*, which is most run upon in the English language, has a box much larger than any of the other compart-

ments, and is placed directly in front of the compositor. In the upper case the boxes are of uniform size, and the letters are placed in nearly alphabetical order, the comparatively rare occurrence of capitals rendering it less important which letter is nearest the compositor's hand. Cases are mounted in a slanting position upon a frame of convenient height.

Cases are named from their use or construction, as "Italic case," a two-third case for holding Italic type; "two-third case," a single case in which two thirds of the space is equivalent to the ordinary lower case, and the remaining third is occupied by the capitals, etc.; "job case," a single case suited to holding a small job font of type; "rule case," a case for holding brass rule; "sort-case," a case for containing "sorts." The manufacture of cases has received a serious setback since the introduction of type-composing machines. See PRINTING.

Case-hardening, the process of converting the surface of certain kinds of malleable-iron goods into steel, thereby making them harder, less liable to rust, and capable of taking on a better polish. Fire-irons, gun-locks, keys, and other articles of limited size, are very commonly so treated, but the process is sometimes applied to large objects, such as iron railway-bars. The articles are first formed, and heated to redness with powdered charcoal or cast-iron, the malleable iron taking carbon from either of these to form a skin of steel upon it; the heated objects are then cooled in cold water, or in oil when they are of a delicate nature. Yellow prussiate or potash or parings of leather have also been a good deal used for coating iron articles with steel by heating them together. Some chemists consider that in this case nitrogen combines with the iron and effects the hardening. The coating of steel is very thin, seldom exceeding one sixteenth of an inch. A Swedish ironmaster has found that a very excellent case-hardening is obtained by treating iron or steel objects with a mixture of animal matter, such as rasped leather or horn, and arsenious acid dissolved in hydrochloric acid, and heating as usual.

Case School of Applied Science, The, at Cleveland, Ohio, founded by Leonard Case (q.v.) of that city. In 1877 a deed of trust was executed setting apart certain real estate for the support of the institution, the deed to take effect upon his death, which occurred in 1880. The Case School was incorporated 29 March 1880. Instruction began in 1881, with a class of 16 students, the school being carried on from that time until the summer of 1885 in the old Case homestead. A commodious building having been erected for the use of the school, it was occupied at the beginning of the term in September 1885. A year later the building with all that it contained was destroyed by fire. It was promptly rebuilt and occupied in 1888. Since that time several additional buildings for laboratory and shop exercises have been erected, with superior apparatus and appliances, and museums are in the course of development. The Case School of Applied Science offers eight regular courses of instruction, each requiring four years. They are civil engineering, mechanical engineering, electrical engineering, mining engineering, physics, chemistry, architecture, and general science. There are 126 professors and

CASE-SHOT — CASEY

instructors and 353 students. The degree of bachelor of science is granted to all who complete one of the regular courses. That of master of science may be conferred upon graduates who have devoted at least one year exclusively to graduate study. Professional degrees, namely, civil engineer, mechanical engineer, electrical engineer, and engineer of mines may also be conferred after one year of graduate study or after professional work in positions of responsibility, for three years after graduation. The property left by Mr. Case as an endowment for the support of the school is valued at about \$2,000,000, and the amount invested in buildings and equipment is about \$350,000. The school derives its support in part also from tuition fees. Its government rests with a corporation consisting of 20 men, from whom six, known as trustees, are selected.

Case-shot, a projectile formed by putting a quantity of bullets into a cylindrical tin box called a "canister," that just fits the bore of the gun. In case of necessity, the canister is filled with broken pieces of iron, nails, stones, etc. The case is closed at both ends by a disk of wood or iron. Shot of this sort is thrown from cannons and howitzers, and is very injurious to the enemy, because the balls contained in the canister spread, diverging in proportion to the distance. The balls vary in weight, according to the character of the ordnance, from one or two pounds to half an ounce each. The range within which case-shot are used sometimes extends to 500, but seldom exceeds 200 to 300 yards. It is also called "canister-shot." The shrapnel-shell, in its present cylindrical shape, may be considered a variety of case-shot. See **ORDNANCE**.

Case-worm. See **CADDIS-FLY**.

Casein, *kā'sē-in* (Lat. *caseus*, "cheese") a substance resembling albumen in its general properties, and obtained from milk. The older chemists gave the name "casein" both to the precipitated substance that is now known by that name, and to the corresponding substance as it exists in solution in the milk; but it is usual at the present time to distinguish the latter as "caseinogen." Caseinogen is the principal nitrogenous constituent of milk, and is precipitated as a curdy mass when acetic acid or a mineral acid is added to milk that has been previously diluted by the addition of its own bulk of water. If the caseinogen so prepared is made into a paste and then treated with a small quantity of rennet, the mass sets at once into a solid clot, consisting of true casein; but Hammarstein has shown that if the caseinogen is first washed entirely free from calcium phosphate, rennet is without action upon it. The precise function of the calcium phosphate is obscure, and the same may be said of the chemical relations of the proteids in general. If rennet is added to fresh milk a bulky deposit of casein comes down immediately; but to obtain the casein in pure form, the oily matters in the milk should be first removed by the action of a centrifugal separator, and the casein, after precipitation, should be compressed so as to expel as much of the whey as possible. Caseinogen is not precipitated by heat, nor does it (like fibrinogen) coagulate spontaneously. The coagulation observed when milk is boiled is due to the albumen present, and not to the casein; and that which occurs upon standing may be due

either to the generation of lactic acid through the fermentation of the lactose present, or to the rennet-like action of the ptomaines liberated by micro-organisms that happen to fall into the milk from the air. According to the analyses of Chittenden and Painter, the elementary percentage composition of casein is as follows: Carbon, 53.30; hydrogen, 7.07; nitrogen, 15.91; sulphur, 0.82; phosphorus, 0.87; oxygen, 22.03. Casein is insoluble in water, but dissolves easily in alkaline solutions. It also dissolves in very weak hydrochloric acid, from which it is again precipitated upon the addition of the same reagent in more concentrated form. When freshly prepared it is soluble in a strong solution of borax, and in this form it is used as an adhesive under the name "casein glue." A compound of casein with lime is also used in the arts for "animalizing" cotton cloth, so that the fibres will retain colors that otherwise would not adhere to them. See **PROTEID**.

Casemates (Sp. *casa*, "a house," and *mataré*, "to kill"), in fortification, vaults which are proof against bombs, and which may be constructed under a parapet and provided with embrasures or ports through which guns are fired. They may serve, at the same time, as a place for keeping the heavy ordnance and various stores, and in case of necessity as habitations for the garrison or shelter for sick or wounded.

Caserta, *kā-zār'ta*, Italy, the capital of the province of Caserta, 17 miles northeast of Naples. It is the seat of a bishop, and contains many fine buildings. The principal edifice is a palace, one of the finest in Europe, a large and richly decorated structure commenced in 1752 by Charles III. of Spain, and situated among gardens adorned with numerous ancient and modern statues. The principal manufactures are silk goods, carpets, linen, etc. The district produces excellent fruit and wine. About two and a half miles to the northeast is Caserta Vecchia (Old Caserta), the new town being distinguished as Caserta Nuova. Pop. 33,000.

Caserta (formerly *TERRA DI LAVORO*), a province of Italy, north of Naples, along the Mediterranean Sea. Its chief industries are agriculture and cattle raising; there are also some flourishing manufactures. Area, 2,033 square miles. Pop. 749,414.

Casey, Silas, American army officer: b. East Greenwich, R. I., 12 July 1807; d. Brooklyn 22 Jan. 1882. He was graduated from the United States Military Academy at West Point in 1826; served in the Mexican war, being present at the battles of Contreras, Churubusco, Molino del Rey, and the siege of Chapultepec. When the Civil War broke out he was given charge of organizing the volunteers near Washington; later served in the Army of the Potomac, and won much distinction at Fair Oaks; was president of the board to examine candidates for officers of colored troops in 1863-5; brevetted major-general, U. S. A., 13 March 1865; and retired in 1868. His publications include 'System of Infantry Tactics' (1862); and 'Infantry Tactics for Colored Troops.' (1863).

Casey, Thomas Lincoln, American military engineer: b. Sackett's Harbor, N. Y., 10 May 1831; d. Washington, D. C., 26 March 1896. He graduated from West Point in 1852, and entered the engineer corps of the army. During the Civil War he was superin-

CASH REGISTER—CASH REGISTER INDUSTRY

tending engineer of defenses on the coast of Maine, and on special duty with the North Atlantic squadron in the first expedition against Fort Fisher. In 1865 he was brevetted colonel for gallant services during the war. In 1868 he was put in charge of one of the departments in the chief engineer's office at Washington; in 1873 was sent abroad for professional service; and in 1877 was placed in charge of the construction of the state, war, and navy building, and of the Washington aqueduct, and also of the Department of Public Buildings and Grounds. Later he built the White House conservatory and the Army Medical Museum, completed the Washington monument, and took charge of the construction of the Congressional Library. He was president of the board of engineers for fortifications at New York in 1886-8; was promoted chief of engineers and brigadier-general in 1888; and was elected to the National Academy of Sciences in 1890.

Cash Register, an automatic mechanism for registering money accounts. It is probably the most antique and, yet in its improved form, the most modern appliance known to commerce. The ancients, more than 6000 years ago, used a registering device, termed an Abacus, for the purpose of indicating visibly to the seller and buyer the amount purchased. The cash register is an absolute necessity. By infallible mechanism it provides not only a correct registration of all the cash received, but at the same time, with the aid of a miniature printing press, it records or prints the details of each and every transaction that occurs, upon a printed strip or tape, thus keeping the proprietor in constant touch with each and every detail of his business, and offering him at a glance, a thousand times a day, if necessary, without the slightest trouble or inconvenience, a diagram of the progress of each department in his store, as well as the industry of each clerk. The push of the industrious one can be noted and appreciated. It furnishes a chart that enables the business man to direct and control his affairs as the pilot controls the movements of his vessel by the compass before him. The miniature printing press attached to the modern cash register also cuts off and issues a printed check or bill, which is handed by the clerk to the customer for payment to the cashier, thus saving a great amount of time and unnecessary labor in writing. The use of the modern cash register is indispensable to the business man, because it furnishes him with a labor-saving device of unerring accuracy for the most sensitive and vital part of his business, "his cash and credit." The prime object of a cash register is to protect and secure a correct accounting of all the cash received or paid out, and where a credit business is done, to so systematize the accounts as to insure a correct record of the same. The good qualities of the modern cash register consist in boldly proclaiming or indicating each and every transaction, and correctly recording or transmitting the indication to the adding and printing mechanism, so that the customer, clerks and proprietor may depend upon a correct accounting of each and every detail of the business.

HENRY S. HALLWOOD,
Hallwood Cash Register Co., Cleveland, O.

Cash Register Industry. The cash register industry originated in the United States,

which now exports each month large invoices of costly and improved registers to every civilized country. No such mechanisms have ever been imported into the United States; and indeed none are in general commercial use in Europe which were not manufactured in this country.

The simplest of such devices are what are known to the trade as Autographics; they are a box with, maybe, a cash drawer, a spring to open the same, a bell to be rung by the opening of the drawer, a roll of paper to be written on and then pass out of sight, for reference and preservation. Many of these autographics, for petty convenience, are manufactured; they require little notice, as they do not differ in principle from a pencil and slate.

The improved cash registers which have created an industry are in extensive use in retail stores, for the purpose of preserving a record of the sales made. Their primary object is to afford a convenient means of making a record, and to insure the accuracy of it, so that the proprietor may know at the end of each day the exact amount of the day's sales, and that each has been accurately and honestly registered. The essentials of such a mechanism have been stated to be: (1) a series of operating keys representing different amounts of money; (2) a registering mechanism upon which the values of the operated keys are added and preserved; (3) an indicating mechanism by which, when any key is operated, an indicating tablet representing the value of such key is exposed to view; (4) an alarm which is sounded by the operation of each key, to call attention to the exposed indication; and usually, (5) a money drawer which is automatically unlocked and thrown open at the operation of any one of the keys. The indicating mechanism gives utility to the machine by compelling the clerk to operate the proper key when he registers each sale. It is the protective element of the machine. Cash registers of the most improved type are not only widely used in stores, but, it is claimed, are "needed and can be sold wherever cash is handled."

The cash register industry has been wholly created within the last twenty years. Certain inventions, contributing some essentials of a successful register, had been known before at home and abroad; but in 1883, these were only models on paper, and no cash register had then been devised which was in commercial use in this or any other country. Prior to this date, however, the National Manufacturing Company at Dayton, Ohio,—a name since changed to National Cash Register Company—was making these machines under the Ritty & Birch patents, which were afterward upheld by the Supreme Court of the United States. They covered an improved device for holding and releasing the indicators.

None of the prior patented devices had either gone into use, or were fitted for practical use; so that in a commercial sense, Ritty & Birch were not only pioneers as to the extent of their improvement, but the actual creators of the first practical cash registers as a whole. The Ritty & Birch invention "brought success to what prior inventions had essayed and in some part accomplished."

The advantage thus obtained was followed

CASH REGISTER INDUSTRY

by great business enterprise and the liberal encouragement of further invention; the National Company now owns 537 Letters Patent of the United States and 394 foreign patents; and in its five invention departments at its factory, employs a corps of inventors, who are followed by forty skilled mechanics doing experimental work.

This company maintains branch factories at Berlin, Germany, and Toronto, Canada; but its main factories are at Dayton, Ohio. Here they occupy nine buildings, covering 892,144 square feet of floor space, and 140 acres of ground. In convenience and attractiveness, and for light, heat, ventilation and all sanitary things, these structures are designed to be models of any use for factory purposes. They have an output of about 5,000 machines per month; mostly of the newer and costlier kinds; about one-third of which are exported to foreign countries. These exported cash registers are adapted to the various currencies of England, Germany, Austria, Hungary, France and Belgium, Norway and Sweden, Holland, Spain, Cuba and Mexico and all Spanish-speaking countries, Brazil and Portugal, India, also Russia. Registers are sold for use in Japan and China, but not yet in the currency of those countries.

Among the more important improvements which inventors have worked out into practical advantage on a cash register may be named:

1. The totalizing counter, which adds all the registrations into one total.

2. The tape-printer, which prints the amount of each registration.

3. The check-printer, which prints, cuts off and throws out a check giving the figures of each registration, with the initials of the clerk making the sale.

4. The throw-out counter, which made it possible to print the amounts of all transactions on the detail tape and check which is issued, but prevents any amount, other than cash transactions, being so added into the totalizing counter.

5. A variation of the foregoing, which adapted it to print, instead of a check, an itemized bill, such as is used in the larger stores and offices.

6. The multiple-counter, which provides a separate adding mechanism for each person who operates the machine.

7. The multiple-drawer feature, or a series of cash drawers attached to one machine, giving the equivalent of many machines in one. This feature may be attached to the different types of registers, and gives the advantage of a separate machine for each individual, so that separate records are made not only of the transactions of each, but mistakes of any one of the different number of clerks using it, are readily identified.

8. Distant indication, which is a means for electrically indicating at a distance; namely, in the proprietor's office, home, or front show window, the sales made as registered on the machine.

Among newer improvements of cash registers are: (1) the application of electricity as a motive power, giving great rapidity of operation and saving of manual work; and (2) the application of cash registering mechanisms to conform to the special requirements of systems of express companies, telegraph companies, banking offices, department stores, post-offices,

railroad offices, wholesale houses, telephone stations and government departments.

Firms who have, in the United States, made and sold cash registers are, or have been, Hopkins & Robinson, at Louisville; The Boston Cash Register and Indicator Co.; the Bensingers, at Chicago; the Sun, at Greenfield, Ohio; the Hallwood, at Columbus; the Kruse Co.; the Union, at Trenton, N. J.; the Globe and the Osborne, at Detroit; The Ideal, of New Jersey; the Chicago Cash Register Co.

Most of these manufacturers are out of active business, but they sold nearly all registers which remain in use in this country that are not Nationals. A cash register has this peculiarity about it, not common to other manufactured things,—the user often does not want it to work rightly; hence, to have value at all, it requires very high workmanship and perfection of part; and any device not so built, has not, thus far, been a commercial success. A good cash register must be one that cannot be beaten. To "beat" a register is to apparently operate it without proper indication and addition in registration. It must be built so as not only to operate accurately, but so that it cannot be prevented from working properly.

The National factory at Dayton employs 3,500 working men and women. About 40,000 persons annually visit this factory. A general interest, which this seems to indicate, and certain unique and perhaps original features in the factory methods of the National Cash Register Company, may justify a few words in explanation of them:

"There is no factory superintendent, but in place of such an official a chairman and a factory committee which holds daily or frequent sessions. This chairman after conference and advice from the committee, directs all departments in the making force. In and over each of all the departments, are subordinate committees, with a chairman who has like authority; and these all work in co-operation."

Nearly all important orders received by employees are first discussed and revised by these committees. In all the selling force, this system, "combining the methods of a military organization and a democracy into a somewhat novel co-operation," are in fixed and successful use. Liberal expenditures by the National Company and co-operative organization of employees for their "welfare work" seem to have won a deserved repute, at least are successfully carried out.

For officers and many of the men and women employees, attractive lunches are provided, for which a moderate charge is made, not intended to be the whole cost; training schools for employees, their children and others in the neighborhood; calisthenics, a dancing school, a boys' garden, rest rooms with a trained nurse and free baths on the company's time, libraries, and a cooking school are some of the interesting features annexed at the company's cost, to the factory work.

In connection with, and as a part of its system of co-operation, the company has paid out in the last five years, for prizes for suggestions alone, \$10,152.68. During the year 1903, 5,078 suggestions were submitted in writing by the factory and office employees, of which number 1,536 were adopted, after having been first

CASHAN — CASHMERE

passed to a special committee for careful examination and report. The company claims these "welfare" expenditures pay in the good will proffered, and in the good will and better work they produce.

A. A. THOMAS,
Secretary National Cash Register Co.

Cashan or **Kashan** or **Kashin**, a town of Persia in the province of Irak-Ajemeé, noted for its production of shawls, silk stuffs, and other goods. It is one of the most flourishing towns in Persia, and has a royal palace, numerous mosques, colleges, bazaars and baths. The inhabitants are noted for their industry, and besides shawls and silk stuffs already mentioned, they manufacture copper goods, gold and silver articles, brocade and cottons. They also have an active trade in agricultural produce, and carry on commerce with all parts of the Orient and with Europe by way of Ispahan. The silk stuffs produced at Cashan are held in high esteem, and are worn largely by the Shah and his entourage. Foreigners from the West who have visited the place have found the inhabitants, who belong chiefly to the Shiite sect of Mohammedans, more enlightened and liberal in their treatment of strangers than most Orientals. Many of the merchants are very wealthy, but are compelled by the oppressive exactions of public officials to hide their riches as much as possible from view. The interior of the homes of some of them, which present a neglected aspect on the outside, are said to be palatial in splendor. The province of Irak-Ajemeé, in which Cashan is situated, has nearly the same boundaries as the country known to the ancients as Great Media, or Media Proper. It is the most productive portion of Persia, fertile and with a flourishing trade. Cashan has a population of about 15,000. See PERSIA.

Cash'el, Ireland, a town in Tipperary County, about 49 miles northeast of Cork; noted as containing the most interesting ruins in Ireland. These consist of a Gothic cathedral founded in 1169; a stone-roofed chapel, built in 1127; Hore Abbey, founded in 1260; the palace of the Munster kings; and a round tower, 90 feet in height and 56 feet in circumference. They are built on the Rock of Cashel, forming the summit of the slope which the town occupies. Here was held the great synod, in 1172, when the Irish priests first acknowledged the authority of the English Church and state. Cashel is a Roman Catholic archdiocese.

Cashew' (a corruption of *acajou*, the French form of the native Brazilian name *acajaiba*), a tree (*Anacardium occidentale*) of the order *Anacardiaceæ*, common in the West Indies. It has alternate, obtuse, ovate leaves, and bears bunches of red, scented flowers. The juice of the stem is used as a varnish; and an aromatic drug is prepared by decoction and maceration of several parts of the tree, afterward consolidated by evaporation. The nut is small, kidney-shaped, ash-gray, and is seated on the end of a large fleshy receptacle. The shell consists of three layers, the outer and inner of which are hard and dry, but the intermediate layer contains a quantity of black, extremely acrid, caustic oil, which is destroyed by roasting the nuts before eating them. The oil is applied to floors in India to protect them from the attacks of

white ants. A wine is made from the fleshy receptacle; and a gum with properties similar to those of gum arabic is obtained from the plant.

Cashgar, or **Kashgar**, the capital city of eastern Turkestan, in the province of Sin-Kiang or Kashgaria. It is situated on the Kizil-Daria or Kashgar River, in a position of strategic importance, 100 miles northwest of Yarkand, and comprises an old and a new town. The latter was built in 1838, is strongly garrisoned, and contains the palace of the Chinese governor. There are considerable manufactures of cotton, gold and silver cloths, carpets, etc., and an extensive trade, its position at the junction of several great routes making it the emporium of much of the commerce of central Asia. It was the capital of an independent kingdom till conquered by the Chinese during the 18th century. In 1865 it revolted but was again subdued in 1876-7. Pop. about 62,000.

Cashibo, ka shé'bō, or **Cachibo**, a savage tribe living near the Ucayale River, a tributary of the Amazon, in eastern Peru.

Cashier, **To**, in a military sense to dismiss from the service by annulling or withdrawing an officer's commission. It is not an official term in the United States, and is commonly construed among military men as having a more disgraceful significance than "dismissal," although there is no analogy or precedent in the use of the word by leading English authors to support this construction. Macaulay uses the term in the sense of simple dismissal or annulment of commission. Nevertheless in ordinary military parlance it means dismissal in disgrace, and its use in any other sense is regarded as unjustified.

Cash'mere, or **Kashmir**, a principality in the northwest of Hindustan, subject to a Maharajah belonging to the Sikh race, but under British protection and supervision. It is composed of various provinces or districts, of which Cashmere proper is the most famous and interesting. It is situated in the southwestern portion of the state, and largely consists of an elevated valley intersected by the Jhelum. Besides Cashmere proper, the state embraces the territory of Jamoo, Balti or Iskardo, and Ladakh and Gilghit. The whole principality thus formed is estimated to cover about 80,900 square miles, and its population in 1901 was 3,000,000. It extends from about lat. 32° to 37° N. and from about lon 73° to 80° E. The territory of Jamoo, which forms the most populous portion of the principality, lies to the north of the Punjab, between the spurs of the Himalaya Mountains leading up to Cashmere and enclosed by the upper courses of the Chenab and Ravee. Its chief town is of the same name. Balti, also called Little Tibet, is an elevated region on the Upper Indus, to the north of Cashmere proper, lying to the southwest of the Karakorum Mountains, and having for its capital Iskardo or Skardo. Ladakh, also called Middle Tibet, lies to the southeast of Balti, between the Himalaya and Karakorum Mountains, and is also traversed by the Indus. Its passes form some of the most important media of communication for central Asia. Its capital is Leh on the Indus. Gilghit is a district on the northwest of Balti. Cashmere and Jamoo is the official title of the

CASHMERE GOAT

whole. The principal river is the Indus, which traverses the state from southeast to northwest, and then takes a sharp turn to the southwest. The upper course of the Chenab is also in the state. Cashmere proper is a valley surrounded by gigantic mountains, belonging to the Himalayas, and traversed by the river Jhelum (formerly Hydaspes). The whole area of the enclosed region is about 4,500 square miles, and of the bottom of the valley about 2,000 square miles. From three sides only seven passes lead to this region; to the east the Himalaya presents an insurmountable barrier of snow. The splendor and sublimity of the diadem of snow-capped mountains, the beauty and richness of the hills which form the ascent to the higher peaks, it is impossible to describe. The elevated situation of the valley, and the mountains of snow which surround it, render the climate temperate; and it is, on the whole, pleasant and healthy. This region, about 5,200 feet above the sea, is watered by numerous streams, and is blessed with an abundance of the finest productions. The Asiatics therefore call it the paradise of India, the flower-garden, and the garden of eternal spring, and such names. The hills are covered with forests and Alpine pastures; at the foot of these are fields of corn; along the sides of the rivers rice is planted; rich orchards extend over the foremost ranges of hills; mulberry-trees are cultivated in abundance for the support of the silk-worms, and are entwined with vines, from whose grapes wine very similar to Madeira is prepared. The fruits of warm climates do not ripen here. The valley is famous for its flowers, with which all the gardens and meadows abound. Violets, roses, narcissuses, and innumerable European flowers, besides many that are not known in Europe, grow wild. The roses and jasmine yield the finest aromatic oils, which form an article of export. Two thirds of the inhabitants are Mohammedans, the remainder Hindus. The capital, Cashmere, is situated on the Jhelum. It is a dirty, ill-built town, extending on both sides of the river for about two miles, with few noteworthy buildings. Jamoo is the winter capital. Besides agricultural and pastoral pursuits the inhabitants carry on certain manufactures, especially woollens and artistic metal work. The manufacture of the celebrated Cashmere shawls is not so extensive as it once was, since manufacturing have been established at Amritsir, in the Punjab, and elsewhere, which compete successfully with those of Cashmere. The genuine Cashmere shawls, however, are said to be of a better quality, owing to the fact that they are made of wool from the wild goat and other wild animals, this wool being, properly speaking, a soft down with which all the animals of this region are clad during the winter season. The shawls are woven in stripes, which are afterward very skilfully sewed together. Cashmere has had a varied history during the different periods distinguished as pro-Buddhistic, Buddhistic, Hindu, and Mohammedan. Buddhism, when driven from Hindustan, found a refuge in Cashmere. Mohammedanism was introduced in the 14th century. In 1586 the country was conquered by Akbar, and became part of the Mogul empire. In 1752 it was subjugated by the Afghans, under whom it remained till 1819, when it was conquered by the Sikhs. In 1846 the Sikh governor, Gholab Singh, made a separate treaty

with the British, by which he acknowledged their supremacy, and agreed to lend them assistance when required. Accordingly he sent a contingent to act with the British forces against Delhi in 1857. A small annual tribute is paid to the British, partly consisting of Cashmere shawls. Under the supervision of the Indian authorities and the British resident at the court of Cashmere, great improvements in the internal condition of the state have recently been effected. The revenue system has been remodeled, and a new land revenue settlement has been completed. According to a recent blue book "An impulse has in consequence been given to agricultural pursuits, cultivation has increased, and local industries in silk culture, vineyards, wine factories, hop gardens, and orchards are being developed. . . . The posts and telegraphs in Cashmere have been taken over by the government of India, with the result of an increase in efficiency and of a saving in expense to the Cashmere state. The Cashmere troops have improved, and have shown their value in active service. Large expenditure has been incurred on public works, particularly on the improvement of the Jhelum and Gilgit roads, and on the construction in the capital, Srinagar, of water-works." A railway belonging to the Indian system now enters the country. The inhabitants are a fine race physically, tall, strong, and well built, with regular features. About two thirds of them are Mohammedans, the remainder mostly Hindus. Earthquakes frequently occur, and one that took place in 1885 caused the loss of thousands of lives.

Cashmere Goat (*Capra hircus*, var. *laniger*), a variety of the common goat remarkable for its fine downy fleece, said to be found in perfection only in Tibet, but also found elsewhere, as in Ladakh or Middle Tibet, now a province of the principality of Cashmere. It is found both in a wild state and as a domestic animal; the former is said to yield the best wool or down. The favorite food of these animals is said to be buds, aromatic plants, rue, and heath. The people of Tibet give the goats at least once a week some salt. If they are transferred from their cold mountainous abode into a warm country, the wool deteriorates. It grows very slowly in the warm part of the year, and more vigorously as the cold season approaches. The colder the region the heavier is the animal's fleece. Proper food and careful tending increase the fineness of the wool. Yearlings, as in the case with the merino sheep, afford the finest wool. A full-grown goat yields not more than eight ounces. The goats which pasture in the highest vales of Tibet have a bright ochre color. In lower grounds the color becomes of a yellowish-white, and still farther downwards, entirely white. The goats of Tibet and Cashmere have the fine curled wool close to the skin, just as the under hair of our common goat lies below the coarse upper hair. The wool is shorn in the spring, shortly before the warm season—the time when the animal in its natural state seeks thorns and hedges in order to free itself from the burden of its warm covering. A large shawl of the finest quality requires five pounds of the wool; one of the inferior quality from three to four pounds. The flesh of the Cashmere goat tastes as well as that of the common one, and its milk is as rich if it is well tended.

CASIGURAN BAY — CASPARI

Casiguran Bay, *kā-sē-goo'ran*, an inlet on the east coast of the province of Principe, Luzon, Philippine Islands, reached through Casiguran Sound. The sound is about nine miles long from Cape Ildefonso to a narrow passage affording access to the bay. The bay itself is about three quarters of a mile long and two and a half miles wide. Its depth is some 16 to 26 fathoms.

Casimir, *kās ĭ mēr*, properly **Kazimierz** ("founder of peace"), was the name of many Polish princes and kings. 1. CASIMIR I., b. 1015; d. 1058. During his minority he was under the regency of his mother and was driven from the kingdom with her. In 1041 his power was re-established, and through his efforts the predominance of Christianity was decided in Poland. 2. CASIMIR III., b. 1309; d. 5 Nov. 1370. called Casimir the Great, who succeeded his father, Vladislav Loketek, as king of Poland in 1333, was the most distinguished of this name. He added Little Russia and Red Russia to his dominions, and repelled the Tartars, who then threatened Poland. He founded the University of Cracow (1364), as well as several schools and hospitals, and showed great anxiety for the advancement of the arts and of learning in his kingdom. In 1347 he caused a new code of laws to be compiled, and protected the peasants, on which account he was called the peasants' king. He had a Jewish mistress who procured for her nation those liberties which they enjoy in Poland to the present day. With him the line of the Piasti, which had ruled in Poland for nearly 530 years, became extinct.

Casimir-Perier, **Jean Paul Pierre**, President of the French republic: b. Paris 8 Nov. 1847. He served in the Franco-Prussian war, and received the decoration of the Legion of Honor for bravery. In 1876 he was elected to the Chamber of Deputies; in 1890 vice-president of the chamber, and in 1893, president. He resigned to become premier, which office he held till the assassination of President Carnot, when he was chosen his successor on the first ballot (June 1894). He resigned the office of president, January 1895, and was succeeded by Félix Faure.

Casino, *ka sē'nō*, or **Monte Casino**, a celebrated Benedictine abbey in Italy, in the Neapolitan province of Caserta, near the small town of South Germano, and about 45 miles from the city of Naples, founded by St. Benedict of Norcia in 529. It is situated on a mountain, from which it derives its name, near the ruins of the ancient Casinum, and is approached by a well paved and winding road. The abbey, after having suffered repeated reverses, finally became considerable for its privileges and its wealth, and in the 11th and 12th centuries was the seat of science, particularly of medicine, the celebrated school of Salerno having been founded by the monks of Monte Casino. The church is very magnificent, although overloaded with ornament, and contains the tomb of the founder. The monastery has served as a place of refuge to several sovereigns and pontiffs, and was formerly much visited by pilgrims and travelers, who were entertained free of expense. It is still visited by travelers or tourists, but it is no longer a conventual institution, being now

devoted to education. The railway from Rome now passes near it.

Casino, a name generally given to a kind of club-house or place of amusement, containing rooms for dancing, playing at billiards, etc. The word is originally Italian, being a diminutive of the Italian word *casa*, signifying a house; and was at first applied to small houses which the nobles of Florence, Venice, and other Italian cities often possessed at a distance from their ordinary residences, and which were devoted to purposes of social enjoyment.

Casiri, *kā-sē'rē*, **Michael**, Orientalist and Syro-Maronite clergyman: b. Tripoli, Syria, 1710; d. Madrid 1791. He studied in the College of St. Peter and St. Marcellino; and in 1734 entered the clerical profession. The following year he accompanied the learned Assemani to Syria, where he was going, at the command of the Pope, to attend the synod of the Maronites, and in 1738 gave, at Rome, an exact account of the religious tenets of the Maronites. He afterward taught in his monastery the Arabic, Syrian, and Chaldee languages, theology and philosophy; and in the year 1748 was invited to Madrid, where he was appointed to an office in the royal library. In 1749 he devoted his attention, by the king's orders, to the library of the Escorial, of which he subsequently became the superintendent. Here he collected the materials for his celebrated work, 'Bibliotheca Arabico-Hispana,' which enumerates in 1851 articles the manuscripts of the Escorial Library, perhaps the richest in Europe in Arabic manuscripts. This work, though not entirely free from errors, contains very important information and valuable extracts, and is indispensable to every Orientalist.

Caskets, **The**, a group of rocks in the English Channel, seven miles from Alderney. They have often been fatal to vessels, and, in 1119, Prince William, son of Henry I., and his suite, perished here. In 1744 the Victory ship of war, of 110 guns, also was shipwrecked upon them. On the highest there is a lighthouse.

Cas'ler, **John Overton**, American soldier: b. Frederick County, Va., 1 Dec. 1838. He served in the Confederate army during the Civil War and was a prisoner of war from February to May 1865. He lived in Texas 1877-89, and has since been a resident of Oklahoma City, where he is justice of the peace. He is the commander of the Oklahoma division of United Confederate Veterans, and has published 'Four Years in the Stonewall Brigade' (1893); 'Lilian Stuart, the Heroine of the Rappahan-nock' (1889).

Casoria, *kā-sō-rē'ā*, Italy, a town in the province of Naples (Napoli), six miles north-northeast of Naples. It has four fine churches, and is the residence of a district judge. Silk is produced in the neighborhood. Pietro Martino, the painter, was born here. Pop. about 10,000.

Caspari, *kās-pā'rē*, **Karl Paul**, German Church historian: b. Dessau 8 Feb. 1814; d. 11 April 1892. He became professor of theology at Christiania in 1857. His Arabic grammar is in high repute, and his contributions to the study of the Old Testament include works on Obadiah, Isaiah, Micah, and Daniel. Besides his 'Anecdotes of Ecclesiastical History'

he published at Christiania 'The Origin of the Story of the Baptismal Symbol, and the Rule of Faith,' extensions of which appeared in 1875 and 1879.

Caspe, kās'pā, Spain, a town in the province of Zaragoza, 12 miles north-northeast of Alcañiz, left bank of the Guadalupe, near its confluence with the Ebro, on several small hills and in the intervening valleys. It has paved streets, one principal and nine smaller squares, a handsome Gothic collegiate and two other churches, several chapels, three schools, a town-hall and prison in a suppressed convent, an hospital, and several public fountains. Manufactures — wine, oil, and soap. Some trade is also carried on in grain and cattle. Pop. 8,427.

Cas'pian Gates, a name given to the Russian fortress Dariel, situated in a narrow defile of the Caucasus, on the Terek, 80 miles north of Tiflis.

Caspian Sea, a large lake or inland sea between Europe and Asia, now nearly surrounded by Russian territory but having Persia on the south; 730 miles in length from north to south, and from 130 to 270 in breadth; area about 170,000 square miles; the largest isolated sheet of water on the globe. The water is less salt than that of the ocean, of a bitter taste, and of an ochre color, without ebb or flow. In some places it is exceedingly deep, yet it abounds in shallows, so as to prevent the navigation of ships which draw more than 9 or 10 feet of water. The level of the Caspian Sea is considerably lower than that of the ocean. Among the rivers which flow into it are the Volga, Ural, Terek, and Kur. In ancient times the Oxus (Amoo Daria) also flowed into it. It has no outlet. The fisheries here, which are very valuable, occupy and train many seamen. Sturgeons and sterlets are caught in great quantities, and there are also salmon-trout, perch, *Silurus glanis*, two kinds of carp, and porpoises; seals abound in the upper coasts, and tortoises between the mouths of the Volga and the Ural. In the northern region the first fishing season, called the caviar season, occurs between March and May, when the Volga, Ural, etc., are getting cleared of ice. The second season is in July, when the sturgeon descend the rivers; and the third or open-sea fishing goes on from September to November. The only ports at all worthy the name on or near the Caspian are Astrakhan, Baku, Derbend, and Astrabad (in Persia). The navigation is at all times difficult and often perilous. Steam packets are now established on this sea. The Russians have also a fleet of war vessels in the Caspian, and a new naval station has been established at Krasnovodsk, on the east side of the sea. By means of river and canal there is water communication between the Caspian and the Black Sea, Baltic, and White Sea.

Cass, Lewis, American statesman, diplomatist, and soldier: b. Exeter, N. H., 9 Oct. 1782; d. Detroit, Mich., 17 June 1866. In 1800 he removed to Marietta, Ohio, where he entered on the study of the law. He was admitted to the bar in December 1802, and soon after established himself at Zanesville, where he gradually acquired practice. In 1806 he was elected to the Ohio legislature. He served in the first year of the second war with England and in 1813 was appointed governor of Michigan Ter-

ritory, holding office till July 1831. Michigan at this time had no territorial legislature, and the business of selecting laws for it from the codes of the States devolved on Governor Cass and the territorial judges. Governor Cass was also *ex officio* superintendent of Indian affairs for the territory, which then included what now constitutes the two States of Michigan and Wisconsin, and this remained for several years the most important part of his duties. Of all this extensive territory, it was only a little tract bordering on Lake Erie and the Detroit River to which the Indian title had yet been extinguished. Within the bounds of his Indian superintendency, ultimately made to embrace all the tribes northwest of the Ohio, there were reckoned to be 40,000 Indians, mustering at least 9,000 warriors. The recent hostilities, and the distrust and suspicions of the Indians, occasioned by the constant calls upon them for additional cessions of land, rendered this office one of great delicacy and difficulty. But Governor Cass, while steadily carrying out the policy of acquisition, succeeded also in maintaining the respect, and even in securing the affection of the Indians. In 1817 he obtained, in conjunction with Governor McArthur, a cession of most of the remaining Indian lands within the state of Ohio, with adjoining tracts in Indiana and Michigan, to the extent of 4,000,000 acres in the whole. This cession removed the Indian barrier hitherto intervening between the settlements of Ohio and those of Michigan. In 1819 he met the Chippewas at Saginaw, and obtained a cession of lands in the peninsula of Michigan to the extent of 6,000,000 acres. As yet the northwestern regions were very imperfectly known. At the suggestion of Governor Cass, an expedition, in which he himself bore a conspicuous part, and of which an account has been published by Schoolcraft, was set on foot in 1820, for exploring the northern shore of Lake Superior, and the course of the upper Mississippi. The next year, by a long, circuitous river navigation, he visited Chicago, then nothing but a military post, with a wide wilderness all about it, and there made a treaty with the Chippewas, Ottawas, and Potawatamies, by which a large additional tract was obtained, completing the extinction of the Indian title to the peninsula of Michigan south of Grand river. In 1828 he made two treaties, one at Green Bay, the other at St. Joseph's, by which many millions of acres were ceded to the United States. Up to his resignation of the office of governor of Michigan, in July, 1831, he had concluded 19 treaties with the Indians, by which cessions had been acquired in Ohio, Indiana, Illinois, Michigan, and Wisconsin, to an amount equal to nearly or quite a fourth part of the entire area of those states. When President Jackson reconstructed his cabinet in August, 1831, Cass was appointed Secretary of War. The policy of the removal of the Indians, especially the southern tribes, to districts west of the Mississippi, had been warmly espoused by Gen. Jackson. The defense of this policy, which had elicited much criticism and a warm opposition, was ably entered upon by Secretary Cass in his first annual report. In 1836 he was appointed minister to France, a post which he held till 1842. He was on excellent terms with Louis Philippe, of whose character he gave a very friendly and favorable account in his 'King, Court, and Gov-

ernment of France,' published in 1840, originally as an article in the 'Democratic Review.' By far the most remarkable incident of his diplomatic career occurred just at its close, in his attack on the quintuple treaty for the suppression of the slave trade. He was United States Senator (1845-8), and having opposed the Wilmot Proviso, became the Democratic candidate for President in 1848, but was defeated. He returned to the Senate in 1849, and was secretary of state (1857-60), resigning because President Buchanan would not consent to strengthen the garrison at Fort Sumter. He wrote: 'History, Traditions, and Languages of the Indians' 1823; 'France, Its King, Court, and Government.' See 'Lives' by Schoolcraft (1848); Smith (1856); McLaughlin (1891).

Cassagnac, Adolphe Bernard Granier de, ăd-ôlf bār-nār gra-nē-ă dē kās sãn yăc, French journalist and politician: b. 1806; d. 31. Jan. 1880. He began his career at Paris as contributor of literary criticisms to the *Journal des Débats*, and soon made himself known, and latterly notorious, as editor of various papers, the *Globe*, the *Pouvoir*, the *Pays*, etc., and as being involved in many controversies and duels. He published various books, chiefly historical. Among the principal are: 'Portraits Littéraires'; 'Histoire des Causes de la Révolution Française'; 'Histoire des Girondins'; 'L'Empereur et la Démocratie Moderne.'

Cassagnac, Paul-Adolphe Marie Prosper (pôl ăd-ôlf mār-rē prôs pār) **Granier de**, son of Adolphe; had a career and a reputation not dissimilar to those of his father. He was born 2 Dec. 1842. He was taken prisoner at Sedan in 1871, and underwent eight months' confinement in Silesia. His violent advocacy of Bonapartism led him into innumerable duels, and he was on several occasions summoned for libelous articles in the *Pays* and other newspapers. He was a vigorous supporter of Gen. Boulanger, but his violence in later years somewhat abated. Since 1884 he has edited a journal known as *L'Autorité*. He has written a 'Histoire de la Troisième République' (1875); 'Empire et Royauté'; 'Mémoires de Chislehurst.'

Cassan'der, king of Macedon, son of Antipater: b. about 354 B.C.; d. 297 B.C. He disputed the sovereignty of Macedon with Polysperchon, whom Antipater had appointed regent at his death in 319 B.C. Allying himself with Ptolemy and Antigonus, he conquered Athens; captured Olympias, the mother of Alexander the Great, and put her to death; and connected himself with the royal family by marrying Thessalonica, half-sister to Alexander. He joined, in 315 B.C., the coalition against the growing power of Antigonus; murdered the rightful heir to the throne, Alexander Ægus, and his mother Roxana; and took the title of king in 306 B.C., which was confirmed to him by the decisive battle of Ipsus in 301 B.C.

Cassan'dra, also **Alexandra**, daughter of Priam and Hecuba, and twin-sister of Helenus. Both children, according to tradition, were playing in the vestibule of the temple of the Thymbræan Apollo, not far from Ilium; and having stayed there too late to be carried home, a couch of laurel twigs was prepared for them, for the night, in the temple. When the nurses went to them the next morning they found two serpents at the side of the children, which,

instead of injuring them, harmlessly licked their ears. This miracle produced a still greater one: the hearing of the children was rendered so acute that they could distinguish the voices of the gods. Cassandra subsequently spent much of her time in the temple of Apollo, who, becoming enamored of her charms, disclosed to her all the secrets of the prophetic art, and in return demanded her love. But Cassandra, when her curiosity was satisfied, refused the dishonorable reward. Apollo, incensed at this, solemnly decreed that her prophecies should never find belief. She frequently and continually foretold the destruction of Troy, and warned her countrymen in vain against the deceitful horse. When Troy was conquered, and Cassandra, with the other maidens, fled to the temple of Minerva, Ajax, son of Oileus, tore her from the altar, deflowered the virgin in the sacred place, and dragged her away to the other female slaves, with her hands tied. On the division of the booty she fell to Agamemnon, who carried her as his slave and mistress to Mycenæ. Clytæmnestra murdered them both. Agamemnon had twins by her—Teledamus and Pelops, who were put to death by Ægisthus. The ancients regarded this rape of Cassandra as a most infamous atrocity. It has often afforded a subject to poets and sculptors. The Locrians, the countrymen of Ajax, were afflicted on this account for many years with storms, and their country was desolated with the plague.

Cassandra, the most westerly of the three tongues of the Chalcidic peninsula, between the gulfs of Salonica and Cassandra. Its ancient name was Pallene. The Gulf of Cassandra was anciently Toronaicus Sinus.

Cassano d'Adda, kas-să'nō dăd'dă, Italy, a town in the province of Milan, and 16 miles north-northeast of the town of Milan, pleasantly situated on a hill on the right bank of the Adda. It is very old, and built mostly of bricks. A bridge of 800 paces connects it with the opposite bank of the river. There are numerous silk-mills. Its military position on the right bank of the Adda has caused it to be the scene of several battles. Here Ezzelino da Romano, the leader of the Ghibellines in Italy, in the time of the Emperor Frederick II., was defeated in 1259; here also Prince Eugene was defeated in 1705, by the Duke de Vendôme, and the French under Moreau, by Suwarow in 1799. Pop. of commune about 10,000.

Cassareep, kăs'sa-rēp, **Cassireepe**, or **Cassiripe**, the concentrated juice of the roots of the common or bitter cassava (*Manihot utilisima*), flavored by aromatics, and deprived of its poisonous properties by boiling. It is used to give a relish to soups and other dishes, and forms the basis of the West Indian "peppercup." It is a powerful antiseptic, and is very useful in keeping meat fresh in a tropical climate.

Cassas, **Louis François**, loo-ē frăn-swă kăs-să, French landscape-painter and architect: b. Azay-le-Ferron, 1756; d. 1827. He went to Italy when very young, and carried with him a collection of views from nature, which he afterward enlarged by others taken in Sicily, Istria, and Dalmatia. He next accompanied the Count of Choiseul Gouffier, ambassador to Constantinople, compared the topography of Troy with the accounts given of it by the ancients, took drawings of the remains and the surround-

CASSATION

ing country, and traveled through Asia Minor, Syria, Palestine, and part of Egypt. On his return he was appointed inspector and professor of design at the Gobelins in Paris. The models which he had made of the most celebrated architectural works of different countries were purchased by Napoleon, who rewarded him with a pension, and caused them to be placed in the Parisian School of Arts. From the materials collected in his travels have been compiled 'Voyage Pittoresque de la Syrie, de la Phénicie, de la Palestine, et de la Basse Égypte' (1799), and 'Voyage Historique et Pittoresque de l'Istrie et de la Dalmatie' (1802, with sixty-nine copper plates). The original drawings for both works were admirable oil paintings, and they were deposited in the Bibliothèque Royale. Cassas was invested with several orders of knighthood.

Cassation, a term used in the courts on the Continent of Europe. It is derived from the Middle Ages, and signifies the annulling of any act or decision if the forms prescribed by law have been neglected, or if anything is contained in it contrary to law.

Cassation, Court of (*Cour de Cassation*), one of the most important institutions of modern France, which gives to the whole jurisdiction of that country coherency and uniformity without endangering the necessary independence of the courts. It was established by the first National Assembly, and has been preserved, in every essential respect, under all the changes of the Revolution and Restoration. It has been maintained even in those districts which, by their union with France became subjected to French laws, but by the Peace of Paris again became part of the Prussian monarchy. In France, as early as the reign of Louis IX. (1226-70), petitions were presented to the king by appellants from the decisions of the courts. In later times appeals to the parliaments, as the highest courts of the kingdom, came into use, and their decisions were not liable to be set aside by the ordinary forms of law. Yet the parties were allowed to dispute even these decisions if they were founded upon errors of fact or violated undisputed principles of law; and by an ordinance of 1302 it was provided that the parties should be allowed royal letters for the defense of their rights against the decisions of the supreme courts (*lettres de grâce de dire contre les arrêts*), which should be issued from the chancery (by the chancellor of France). The case was then sent back to the parliament for further investigation, but was examined and decided in the presence of the king himself, or of a special commissioner. An abuse, however, crept in of transferring these cases to the royal council, where they were decided by officers called *maîtres des requêtes*. These letters received the name of *lettres de proposition d'erreur*, and during the civil commotions at the end of the 14th century began to be more frequently presented to the council, which, as soon as one party complained of the partiality of the parliaments, transferred the case to its own bar, and obstructed the course of justice by *lettres d'état* suspensions of the process, on the pretext of the absence of one of the parties in the service of the king). Under the Chancellor Poyet (1538-42), this abuse reached its highest pitch; but the Chancellors Olivier (1545-51), and

Hôpital (1560-8), the two great reformers of French jurisprudence, limited the use of these *lettres* till, by the Ordinance of Blois (1576), all the provisions against the decisions of the parliaments were reduced to these three:—the *proposition d'erreur*, for an error of fact; *requête civile*, to restore the parties to their former condition on account of the fraud of one of the parties or the mistakes of the attorney; and *cassation* (petition for abrogation), for violation of forms or settled principles of law. By the famous Order of Procedure of 1667 the first of these provisions was abolished, but the province of the *requête civile* and *cassation* was enlarged and more precisely defined. The former was always brought before the court itself and decided there, the latter before the council. For this purpose, in the *conseil privé*, or *conseil des parties*, a particular committee was formed, consisting of the chancellor, the four secretaries of state (ministers of the departments), the council of state, and all the *maîtres des requêtes* (in 1789, 78 in number). The decisions of this committee were too much influenced by the will of the king and the ministers, and by various other circumstances, so that they did not enjoy great respect, though they often exposed acts of great injustice on the part of the parliament and other high courts. It was therefore abolished in the first National Assembly, and its place supplied by an independent court—the *tribunal de cassation* (decrees of 27 Nov. and 1 Dec. 1790), which was retained in all the constitutions and received under the imperial government (1804) the name *cour de cassation*, which it still retains. It consisted, according to the organization of 1800, of 48 members, chosen from the senate, on the nomination of the consuls, who elected their own president from among themselves. The appointment of president was afterward vested in the emperor. In the *Charte Constitutionnelle* of 1814 the number of members of the *court de cassation* was fixed at 49, at which it still remains. The members are appointed for life by the president of the republic, and consist of a first president, three presidents of sections, and 45 councilors, besides certain honorary members. The minister of justice, or keeper of the seals (*garde des sceaux*) has the right of presiding on certain occasions. This court never decides on the main question at issue, but on the competency of the other courts and on the petitions to have their decisions reviewed or annulled, and assigns the question to another court if a decision is to be set aside for an evident violation of the forms or the principles of the law. For this purpose it is divided into three sections or chambers:—the *chambre des requêtes*, which decides on the admissibility of the petitions in civil cases; the *chambre de cassation civile*; and the *chambre de cassation criminelle*. After a decision has been reversed, if a second court decides the same case in the same way, and an appeal is entered again, the court of cassation must either request an authentic explanation of the law from the government, or at least all the three sections must unite, to pronounce a second reversal or cassation; and if a third decision is the same as the preceding, the court before which the case is again brought must submit to the doctrine of the court of cassation on the point of law in dispute. This system, which dates from 2 April 1837, gives great authority to this court

A. J. CASSATT,
President Pennsylvania Railroad Company.

CASSATT — CASSEGRANIAN TELESCOPE

in matters of jurisprudence. According to the law in force before 1837, the court before which a case was brought for decision a third time was not required to adopt the views of the court of cassation, but after the third decision there was no further appeal. The government, however, in that case gave an authentic interpretation of the law if there was any occasion for so doing. Until the end of 1852 there was a similar court of cassation for the Prussian province of the Rhine, but in 1853 its jurisdiction was transferred to the supreme Prussian tribunal sitting at Berlin. The sentences of the court of cassation are not only recorded in the journals of the courts, the decisions of which are reversed, but published likewise in an official bulletin, by which consistency and uniformity are preserved. The tribunal of cassation has enjoyed from its commencement the respect and confidence of France, and has numbered among its members several of the most distinguished lawyers; as the President Henrion de Pansey, the councilors, Chabot, Merlin, and Carnot.

Cassatt, Alexander Johnston, American railway president: b. Pittsburg, Pa., 8 Dec 1839. He was educated in the University of Heidelberg, and the Rensselaer Institute, Troy, N. Y., and in 1859 was employed as civil engineer in surveying a railroad route in Georgia. He entered the service of the Pennsylvania Railroad as rodman in 1861, became general superintendent of the Pennsylvania system and general manager of the lines east of Pittsburg, 1871-4; third vice-president, 1874; and first vice-president, 1880. He resigned this last-named post in 1882, but was elected a director in 1883, and in June 1899 was elected president of the Pennsylvania system. He is at present the president of seven companies, and a director in 23, including transportation, banks, and trust companies.

Cassatt, Mary, American artist b. Pittsburg, Pa., about 1855. In 1875 she went to Europe to study art, and lived for some years in Spain, where she gave particular attention to the works of Velasquez. Removing to Paris, she was influenced by the work of Manet and Legas, and exhibited in the Impressionist Exposition about 1880. In 1898 she exhibited some of her works in New York city. Returning to Europe, she established a studio in Paris, where she has since lived. She has gained considerable fame as an etcher, ranking among the first of the modern artists in this medium.

Cassava, kās-sū'vā, **Manioc**, mǎn'ī-ōk, or **Mandioc**, a South American shrub (*Manihot utilissima*) belonging to the natural order *Euphorbiaceæ*, sub-order *Crotonceæ*. There are two forms, popularly known as bitter and sweet, both of which are widely cultivated in tropical America for their fleshy, cylindrical, starchy roots, which form a large part of the food of the natives, and from which tapioca is made. They have also been introduced into other warm countries, especially Africa, and have quickly gained important positions as food crops.

The plant, which attains a height and breadth of four feet or more, is rather bushy, since its numerous knotty, brittle, pithy stems have many palmate leaves. The flowers, which appear in midsummer, are green or yellowish and inconspicuous, and are succeeded by wing-

angled capsules. The best results are obtained on light, sandy, well-drained soils. The land is prepared as for corn, but instead of planting seed, stem cuttings are covered by the plow, and when the plants appear they are cultivated with the same implements used in corn-growing. In about seven months the white soft roots, which occasionally weigh 30 pounds, and are sometimes three feet long and three inches thick, are dug by hand, washed, grated, or ground to pulp. The juice, or poisonous part, is carefully pressed out, and when boiled, becomes the delicious sauce called cassar, much esteemed by epicures. The flour that remains after pressure is formed into thin, round cakes, and baked. To a European accustomed to eat bread, these, though sweetish and not unpalatable, have an insipid taste. If placed in close vessels, and preserved from the attacks of insects, cassava bread may be kept for several months without injury.

Poisoning by the bitter cassava is due to the presence of minute quantities of hydrocyanic acid. This is a very common ingredient of many fruits and seeds, but usually is modified as the fruit ripens. The general process of manufacture of cassava destroys or drives off the free hydrocyanic acid. The symptoms of this poison are very acute. Death is very sudden from paralysis of the heart and respiratory centres. Non-fatal poisoning is accompanied with great prostration, nausea, vomiting, and collapse. There are no efficient antidotes.

The natives of South America throw a number of cakes of cassava together to heat, after which they soak them in water, which causes a rapid fermentation to take place; and from the liquor thus obtained they make a very sharp and disagreeable, but intoxicating beverage, which will not keep longer than 24 hours without spoiling.

From the pure flour of cassava is formed the substance called tapioca, which is frequently used for jelly, puddings, and other culinary purposes. This is separated from the fibrous parts of the roots by taking a small quantity of the pulp after the juice is extracted and working it in the hand till a thick, white cream appears on the surface. This, being scraped off and washed in water, gradually subsides to the bottom. After the water is poured off the remaining moisture is dissipated by a slow fire, the substance being constantly stirred, until at length it forms into grains about the size of sago. These become hard by keeping, and are the purest and most wholesome part of the cassava.

The roots of another species of this shrub, called sweet cassava (*Manihot api*), the juice of which is not poisonous, are usually eaten with butter, after being roasted in hot ashes. They have much the flavor of chestnuts, and are an agreeable and nutritive food, containing about 30 per cent of carbohydrate materials. The roots of the sweet cassava are also used as stock-food and to make glucose and starch. Florida is the only State in which sweet cassava has attracted much attention, but it seems to be not very profitable there on account of the high price of labor and fertilizers.

Cassegranian Telescope, a form of the reflecting-telescope in which the great speculum is perforated like the Gregorian, but the rays converging from the surface of the mirror are

reflected back by a small convex mirror in the axis of the telescope, and come to a focus at a point near the aperture in the speculum, where they form an inverted image, which is viewed by the eyepiece screwed into the tube behind the speculum.

Cassel, *käs'sēl*, or **Kassel**, formerly the residence of the Elector of Hesse-Cassel, and now the chief town in the Prussian province of Hessen-Nassau, lies on the Fulda, 91 miles north-northeast of Frankfort-on-the-Main. It is divided into the Altstadt, or Old Town; the Ober Neustadt, or Upper New Town; the Unter Neustadt, or Lower New Town; and the new West Quarter; all but the third being on the left bank of the river. Cassel has several fine squares, or open areas, on the principal of which, the Friedrichsplatz, stands the electoral palace, an indifferent structure; and next to it the museum, a handsome building, containing a library of 170,000 volumes, and many valuable MSS. At one end of this area is a handsome triumphal arch and war monument overlooking the Fulda valley, in which is the Karlsau, finely laid out, and forming a favorite promenade. On this side of the city are also the building for the courts and government offices, the Bellevue palace containing the academy of arts, and the handsome picture-gallery containing some fine examples of the old masters, especially the Flemish and Dutch. The other more noticeable public areas are the Königsplatz, in the form of a circle; the Friedrich-Wilhelmsplatz, with an ornamental fountain; the Ständepplatz, a broad tree-planted avenue, etc. The most noteworthy church is the Protestant church of St. Martin, with a nave of the 14th and a choir of the 15th century. An observatory is likewise situated here. Cassel has iron-foundries and machine-shops, works for railway-carriages, mathematical instruments, pianos, gloves, jute works, etc. In the vicinity is Wilhelmshöhe, the elector's summer palace, the temporary residence of Napoleon III. after Sedan. Pop. (1901) about 107,000.

Cas'sia, a genus of leguminous plants, of the tribe *Casalpiniae*, inhabiting the tropical parts of the world, consisting of trees, shrubs, or herbs, the leaflets of several species of which constitute the well-known drug called senna. That imported from Alexandria is obtained from *C. acutifolia* and *C. obovata*. *C. fistula* is found wild in India. Its legumes contain a quantity of thick pulp, which is a mild laxative and cathartic, and enters into the composition of the confection of cassia and the confection of senna. It belongs to the sugar class of laxatives, its properties being due for the most part to the water-attracting properties of sugar while in the intestinal canal. The leaves and flowers are also purgative. The bark and roots of several of the Indian species are much used in medicine. "Cassia bark" is a common name for the bark of an entirely different plant, *Cinnamomum cassia*, belonging to the laurel family. It is much imported into Europe, mostly from China, and is also called *Cassia lignea*. Its flavor somewhat resembles that of cinnamon, and as it is cheaper it is often substituted for it, but more particularly for the preparation of what is called oil of cinnamon. The cassia of the Bible was probably cassia bark. Cassia buds, which are similar in flavor, are the unripened fruits of this tree.

Cassia'nus, otherwise called **JOANNES MASILIENSIS** and **JOANNES EREMITA**, early theological writer and zealous advocate of the monastic system, who flourished in the early part of the 5th century, but so little is known of the time and place of his birth that it is still doubtful whether he was a Scythian, Greek, or Roman. It is certain, however, that he traveled extensively in the East, and was long a pupil and deacon of Chrysostom. When the latter, through the intrigues of his opponents, was removed from the episcopal chair, Cassianus was sent with Germanus to Rome to present a memorial from the clergy who adhered to Chrysostom. Here he became personally acquainted with Pelagius. About 415 he went to Marseilles, where he continued a course of restless activity as a presbyter till his death, which took place some time between 430 and 450. He founded two monasteries on the principles laid down by him in his works 'De Institutis Cenobiorum' and 'Collationes Patrum Sceticorum' (that is, 'Conferences of the Monks in the Desert of Sketis'). The views advanced in these works, and still more the strong leaning which he showed to the dogmas of Pelagius, involved him in a controversy with Augustine. He ultimately modified his opinions so far as to adopt the system to which theologians have given the name of Semi-pelagianism, holding that man, since the fall, is not absolutely incapable of good, but, on the contrary, both derives from nature the seeds of virtue, and is able of himself to commence their primary development, though he requires the aid of divine grace to bring them to maturity. These views found great favor with the monks of France, and long maintained their ground in opposition to the efforts of Augustine and his friend Prosper of Aquitania. The best edition of the works of Cassianus is that of Frankfort (1722, fol.).

Cas'sin, John, American ornithologist: b. near Chester, Pa., 6 Sept. 1813; d. Philadelphia 10 Jan. 1869. He resided in Philadelphia from 1834, and excepting a few years partially given to mercantile pursuits, devoted himself to the study of ornithology. He contributed descriptions of new species and synoptical reviews of various families to the 'Proceedings' and the 'Journal' of the Philadelphia academy of natural science; and his more elaborate publications are 'Birds of California and Texas,' containing descriptions and colored engravings of 50 species not given by Audubon; 'Mammalogy and Ornithology of the Wikes Exploring Expedition'; 'Ornithology of the Japan Expedition'; 'Ornithology of Gilliss's Astronomical Expedition to Chile'; and the chapters on rapacious and wading birds in the 'Ornithology of the Pacific Railroad Explorations and Surveys.' His works are the result of careful research, and are especially valuable for their descriptions and classification of many birds not given in the previous works of Wilson and Audubon. According to Coues he was the only American ornithologist as familiar with the birds of the Old World as with those of America.

Cassini, Giovanni Domenico, *jō vān'nē dō-mē'nē-cō kās-sē'nē*, Italian astronomer: b. Perinaldo, near Nice, 8 June 1625; d. Paris 14 Sept. 1712. He studied at Genoa with the Jesuits. Chance turned his attention to astronomy, in which he made such rapid progress that

CASSINI — CASSIODORUS

in 1650 the senate of Bologna bestowed on him the first professorship of astronomy at the university. A meridian had been drawn by Ignatio Dante (1575) in the church of St. Petronia in that city. In 1653 Cassini conceived the idea of extending and correcting it. In two years he completed this difficult task, the first-fruits of which were more correct tables of the sun, a more precise determination of its parallax, and an excellent table of refractions. By an observation at Città della Piave he discovered the shadows cast by the satellites of Jupiter on the disk of that planet when they are between it and the sun. By means of these he corrected his theory of the motion of the satellites, and determined the period of Jupiter's revolution. In 1668 he published his 'Ephemerides of the Satellites of Jupiter.' In 1673 he settled in France. He discovered four new satellites of Saturn and the zodiacal light, proved that the axis of the moon is not perpendicular to the plane of the ecliptic, and showed the causes of her libration. The laws of this motion are one of his finest discoveries. He also wrote observations on the Indian calendar. The meridian commenced by Picard and Lahire was continued by Cassini in 1700 to the extreme limits of Roussillon, and when measured 100 years later showed a difference of only 21 toises (about 134 feet). He lost his sight some years before his death. His 'Opera Astronomica' was published at Rome in 1666.

Cassini, Jacques, zhàk, French astronomer: b. Paris 18 Feb. 1677; d. Thury, department of Oise, 16 April 1756. He was the son of Giovanni Domenico and succeeded him in his post at the Paris observatory. In 1694 he was admitted into the Academy of Sciences. His labors to determine the figure of the earth are well known. The first measurement of 1718 made the degrees of the meridian shorter toward the north than toward the south, whence it was concluded that the earth was an oblong spheroid. Cassini continued the measurement, and maintained this opinion in his work 'De la Grandeur et de la Figure de la Terre.' In order to settle the question the Academy was commissioned in 1733 to measure the whole length of France from Brest to Strasburg. Cassini directed this undertaking, but was led into some errors by the defective instruments of former observers. The astronomical tables which he compiled were published at Paris in 1740. He wrote a great work on the inclinations of the orbits of Saturn's satellites and ring. In addition to his astronomical works, he wrote several essays on subjects in natural philosophy, etc.

Cassini, Jacques Dominique, zhàk dō-mē-nēk, COUNT DE, French astronomer: b. Paris 30 June 1748; d. Paris (?) 18 Oct. 1845. He was the son of Cassini de Thury and succeeded his father in 1784 as director of the Paris observatory. He was a member of the Academy, and a statesman of ability as well as a mathematician. In 1789 he completed the topographical work which was begun by his father. The 'Atlas National' was a reduction of it on a scale of one third. Cassini was arrested by order of the revolutionary tribunal. He escaped with life, but lost the copper-plates of the 'Carte de France,' which had cost 500,000 francs. Napoleon made him a count of the empire.

Cassini de Thury, de tū-rē, César François, sã-zâr frañ-swã, French astronomer: b. Paris 17 June 1714; d. 4 Sept. 1784; son of Jacques Cassini. He was a member of the Academy from his 22d year, and director of the observatory in 1756. He undertook a geometrical survey of the whole of France. When the support of the government was withdrawn in 1756, Cassini formed a society for advancing the requisite sums, which were to be repaid by the sale of the maps constructed from the survey. The work was almost entirely finished when he died.

Cassinian, or **Cassian Oval**, a special cartesian oval. It is the locus of a point the product of whose distances from two fixed points is constant. It varies in shape as the constant product and the distance between the fixed points are differently chosen, and may break up into two separate, but symmetrical figures. Another special form is that of Bernoulli's lemniscate.

Cassino, a game at cards usually played by four persons (although more can enter the game), two on each side. In it the ten of diamonds, technically called big cassino, counts two; and little cassino, the two of spades, counts one. The points possible to be scored in one deal (exclusive of sweeps) number 9. They are: Big cassino, 2; little cassino, 1; cards, 1; spades, 1; each ace, 1 = 4. A sweep is counted when a player takes up all the cards on the table. The object sought in the game (besides the points already enumerated) is to arrange the cards on the board in combination so that the sum of the spots on the cards thus combined may equal those on one card in the hand of the player, who has the right to take as many cards from the board as he can thus combine; or he may capture any card from the board the counterpart of which he has in hand.

Cassiodorus, Magnus Aurelius, Roman historian and statesman, who lived from about 468 to 568. He entered the service of the Ostrogoth king of Italy, Odoacer, at the age of about 20 years and under him and his successor Theodoric was treasurer of the kingdom and trusted counselor, administering his office with extraordinary prudence in a most difficult time. As statesman, scholar, and historian he kept alive the lamp of the Græco-Roman learning after the overwhelming of the ancient civilization by the barbarians. After a term of 50 years in public station he withdrew to a monastic institution founded by himself in his native province Bruttium and there spent the remaining 30 years of his useful life, imbuing his monks with a love of the ancient learning and employing them in copying the ancient texts of profane no less than of religious writings. He may be regarded as the father of the monastic *Scriptorium* to which modern learning is indebted for great part of what has come down to us of the ancient literature and of the history of the west in those troublous times. He composed manuals of rhetoric and grammar which were used as text-books in the schools of the Middle Ages till the revival of the ancient learning, and which inspired men with a longing for the ancient knowledge. Of great service also were his works 'De Artibus ac Disciplinis Liberalium Literarum' (of the liberal arts and courses of study), and his 'De Institutione Divinarum Literarum' (instruction in scriptural know-

ledge); but above all his 12 books of 'Epistolæ Variae' (various letters), containing decrees of the Ostrogothic kings, upon which is based the whole history of Italy under the rule of those barbarian potentates: this collection was first printed at Augsburg 1533. With one Epiphanius he made a compendious Latin version, entitled 'Tripartita Historia' (tripartite history) of the history of the Church as written by the three Greek historians, Socrates, Sozomen, and Theodoret, and continued Socrates' history to the year 518. An edition of his complete works was printed at Rouen in 1679 and at Venice in 1729. His 'Life' was written by the eminent Benedictine, Sainte Marthe, and published in Paris in 1694.

Cassiopeia, kās-i-ō-pē'ya, in Greek mythology, daughter of Arabus and wife of Cepheus, to whom she bore Andromeda. She dared to compare her daughter's beauty to that of the Nereids, who, enraged thereat, besought Poseidon for vengeance. The god, in compliance with the request of the water-nymphs, laid waste the dominions of Cepheus by means of a deluge and a dreadful sea-monster.

In astronomy Cassiopeia is a conspicuous constellation in the northern hemisphere, situated next to Cepheus. In 1572 a new and brilliant star appeared in it, which, however, after a short time, gradually diminished, and at last disappeared entirely. The constellation Cassiopeia contains 55 stars, five of which, arranged in the form of a W, are of the third magnitude.

Cassiquiari, kās-sē-kē-à'rē, or **Cassiquiare**, a deep rapid river of South America, in Venezuela, branching off from the Orinoco, and forming a water-way by which that river has navigable communication with the Rio Negro. It leaves the Orinoco in lat. 3° 10' N.; lon. 66° 20' W., about 20 miles west of Esmeralda, and, after a southwest course of 128 miles, falls into the Rio Negro near San Carlos, in lat. 2° 5' N.; lon. 67° 40' W. It is estimated to carry off about a third of the water of the Orinoco, being 100 yards broad where it leaves that river, and about 600 yards at its junction with the Rio Negro. By means of this river, the Rio Negro, the Amazon and its tributaries, it is practicable to sail from the interior of Brazil to the mouth of the Orinoco.

Cassiterides, kās-sī-tēr'ī-dēz, a name derived from the Greek *kassiteros*, tin, and anciently applied, but with no uniformity or precision, to the tin district of Cornwall, to the Scilly Isles, or to small islands off the northwest coast of Spain.

Cassit'erte, native dioxide of tin, SnO₂, crystallizing in the tetragonal system, and also occurring uniform and in rolled grains. The crystals are usually brown or black, brittle with an uneven fracture, and with a specific gravity of from 6.8 to 7.1, and a hardness of from 6 to 7. Ordinary massive or crystallized cassiterite is often called "tinestone," especially in England; "wood tin" is a botryoidal form, "stream tin" is the mineral in small rolled pebbles found in the streams or placer deposits and is formed by the disintegration of stanniferous rocks. Cassiterite is the most important ore of tin. It occurs in Cornwall (England), Saxony, Bohemia, Galicia, Greenland, Sweden, and in Australia, the Malay Peninsula, Banca, Bolivia, and Mexico. In the

United States it is found in small amounts in various States, and it has been mined to some extent in Virginia and in South Dakota. A promising deposit has recently been reported from San Bernardino County, Cal., where mining operations have been carried on for some time with apparent success.

Cassius, kăsh'ūs, **Andreas**, Dutch physician who flourished during the 17th century. He graduated at Leyden in 1632, was physician to the Duke of Holstein and Bishop of Lubeck, and died at Hamburg in 1673. His name is best known in connection with a purple color obtained from gold, which was briefly described in a treatise published by his son in 1685.

Cassius Longinus, **Caius**, the friend of Brutus, was the quaestor of Crassus, and preserved the few troops of that general who escaped from the bloody battle with the Parthians. With these he defended Syria against the Parthians till the arrival of Bibulus. In the famous civil war that broke out between Pompey and Cæsar he espoused the cause of the former, and, as commander of his naval forces, rendered him important services. When Cæsar, after the victory of Pharsalia, was in pursuit of Pompey, he advanced with a few vessels, while crossing the Hellespont, against a fleet of 70 sail commanded by Cassius, and called upon him to surrender. The latter, astonished by his daring courage, surrendered at his summons. Cæsar pardoned him, and afterward bestowed various honors on him; but Cassius, who had always cherished feelings of bitter hatred toward Cæsar, joined in the conspiracy against him, and, with the aid of several fellow-conspirators, assassinated him, 44 B.C. He then, together with Brutus, raised an army to maintain the cause of their faction. They were met by Octavianus and Antony, who professed themselves the avengers of Cæsar, at Philippi. The wing which Cassius commanded being defeated, he imagined that all was lost, and killed himself, 42 B.C. See BRUTUS; CÆSAR.

Cassius, **Purple of**. See PURPLE OF CASSIUS.

Cassivellaunus, kās-i-vē-lō'nūs (in Shakespeare's 'Cymbeline,' CASSIBELAN), a noble and warlike British chief of the Catuvellauni, who, when Cæsar invaded Britain in 54 B.C., held sway over several tribes living to the north of the Thames, and led the resistance to the advance of the Roman general. Having advanced to the Thames, Cæsar found the Britons under Cassivellaunus posted on the north bank of the river prepared to dispute his passage. He crossed, however, without much difficulty, but the British charioteers persistently harassed his line of march. The Trinobantes, a tribe of Essex and Middlesex, soon sent in their submission to Cæsar, and as their example was followed by others, Cassivellaunus found himself unable to oppose resistance to the Romans. His stronghold, which contained many cattle, was captured by Cæsar; and an attempt made to storm Cæsar's naval camp proving unsuccessful, Cassivellaunus sued for peace, gave hostages, and promised an annual tribute.

Cassock, a name formerly applied to a long loose gown worn over the other garments, in which sense the word is found in Shakespeare. It is now applied to a tight-fitting coat worn under the gown or surplice by the clergy.

CASSOWARY—CAST IRON

The cassock is generally black; but in the Catholic Church only the ordinary priests wear black cassocks, those of bishops being purple, of cardinals scarlet, and that of the Pope white.

Cassowary, a corruption of a Malayan name for birds of the family *Casuaridae* belonging to the *Ratitæ*, their affinities being greatest with the emu. The shortness of their wings totally unfits them for flight. As in others of this group, the pectoral or wing muscles are comparatively slight and weak, while those of their posterior limbs are very robust and powerful. The wings of the ostrich are of some assistance to it in running, but those of the cassowary are too short to be of service in this way, and with the exception of the ends of the five stiff quills are completely hidden beneath the plumage. The cassowaries have three toes, all provided with nails, of which the inner one is much elongated.

The cassowaries constitute a single genus (*Casuarus*) all the species of which have a long compressed bill, a cancellated bony crest or helmet on the head, and stiff barbless quills on the wings. Several species are known, and of these one of the most familiar is the helmeted cassowary of Ceram (*C. galeatus*), which has the head surmounted by an osseous prominence covered with a sort of horny helmet; the skin of the head and superior part of the neck is naked, of a deep-blue and fiery-red tint, with pendent caruncles or wattles. The naked rigid quills on the wings are used as weapons of defense, but the cassowary is rather timorous and shy. It is about $5\frac{1}{2}$ feet long from the tip of the bill to the extremity of the longest claw. The head and neck together measure 18 inches; the largest toe, including the claw, is 5 inches; and the claw of the inner toe is $3\frac{1}{2}$ inches long.

All the feathers of the cassowary, which have a peculiar structure, are of the same kind, contour feathers serving only for covering, and externally are all of one color. In this genus the aftershaft is as long as the shaft and both are filamentous. The double feathers are of unequal length, some on the rump being 12 or 14 inches long, while others are only 3. The stem or shaft is flat, shining, black, and knotted below, having a beard arising from each knot. The helmet is black in front and yellow behind. The eye is of a bright yellow, and more than an inch in diameter.

The anatomy of the cassowary differs very materially from that of the ostrich, which it resembles so much in general appearance. The intestines are short, and the cæcum small; there is no stomach intermediate to the crop and gizzard, and the cloaca is not larger in proportion than that of other birds. It feeds on fruits, eggs of birds, etc., and inhabits the forest districts.

As might be inferred from its structure, the cassowary is a swift runner, and its mode of progression, being unaided by wings, is as peculiar as it is efficient. In running, the cassowary appears to strike out powerfully with one leg, so as to project its body violently forward with a bounding motion, far surpassing the speed of a horse. It also kicks violently when, in a state of captivity, it is provoked to anger, and can inflict a very severe blow. The eggs of the galeated cassowary are green, and are neither so round nor so large as those of the ostrich. The shell is marked by numerous little

deep-green tubercles. The largest of their eggs measure about 15 inches in length and 12 round. Eight species, with a number of local races, are known, distributed with New Guinea as a centre to this and surrounding islands and the adjacent parks of Australia. See also EMU; OSTRICH.

Consult Rothschild, 'Transactions of the Zoological Society,' London, 1901; Mosenthal & Harting, 'Ostriches and Ostrich-Farming.'

Cassowary-tree. See CASUARINA.

Cast, in the fine arts, is an impression taken by means of wax or plaster of Paris from a statue, bust, bas-relief, or any other model, animate or inanimate. In taking a cast from a living person's face, it is necessary, first, to anoint the eyebrows and eyelashes, and any hairs about the cheeks and temples, with a little sweet-oil; then to insert two tubes (oiled also) of pasteboard into the nostrils, so that breathing may be performed through them; a handkerchief is then to be tied loosely over the face, and the head sloped backward in an elbow chair or sofa. Powdered and calcined plaster of Paris is then mixed with spring water to the consistence of cream, and poured in between the face and handkerchief to the depth of half an inch. On becoming fixed or hard, it is removed and left to dry. When dried thoroughly it is well soaked with linseed-oil, and an impression may then be taken from it, in plaster of Paris or soft clay; the hollow cast being first split longitudinally down the nose, so that the object cast may be more easily removed.

It ought to be observed that all models should be divided into several pieces or joints; thus, in that covering any round body, one side must be covered first with the plaster, and the sides pared with a knife, and smeared with clay and water, then the remaining part of the object covered with plaster, and a joint will thus be formed between the two parts; for, wherever the mixture of clay and water has been applied with a hair brush, the cast will not adhere, and therefore will be easily separated with the blunt edge of a knife. It is usual also to make small pits or depressions of the size of small buttons, on the edges of the joints of molds, so that they may lock together well when added, and thus fit closely.

Plaster casts are varnished by a mixture of soap and white wax in boiling water. A quarter of an ounce of soap is dissolved in a pint of water, and an equal quantity of wax afterward incorporated. The cast is dipped in this liquid, and after drying a week is polished by rubbing with soft linen. The surface produced in this manner approaches to the polish of marble. When plaster casts are to be exposed to the weather, their durability is greatly increased by saturating them with linseed-oil, with which wax or rosin may be combined. When intended to resemble bronze, a soap is used made of linseed-oil and soda, colored by the sulphates of copper and iron. Walls and ceilings are rendered waterproof in the same way.

Cast, or Casting-line, a gut line used in angling, from two to four yards in length, having artificial flies attached to it at intervals of about two feet.

Cast Iron, iron obtained from the blast-furnace by running the fused metal into molds prepared for the purpose. The molds are in

CAST STEEL — CASTANOS

the form of long, narrow channels, from which the iron, when it has cooled and solidified, is taken in bars called "pigs," between three and four feet long, and three or four inches broad. See IRON.

Cast Steel, blister steel which has been broken up, fused in a crucible, cast into ingots, and rolled. The blocks of steel are melted in crucibles of refractory clay, and the molten metal is poured into ingot-molds of cast iron. These are opened to let out the red-hot ingot, which is then passed to the rolls. The process of making cast steel was invented by Benjamin Huntsman, of Attercliff, near Sheffield, in 1770. See STEEL MANUFACTURE.

Castagno, Andrea del, ăn-dră'ă dël kăs-tăn'yô, Italian painter: b. Castagno, Tuscany, about the end of the 14th or beginning of the 15th century; d. 1480. Being early deprived of his parents, who were extremely poor, he was employed by his uncle to tend cattle in the fields, and in that situation, by his surprising and untutored essays in the art, attracted the notice of Bernardetto de Medici, who placed him under the tuition of one of the best masters Florence then afforded. At first he painted only in distemper and fresco, and was in high repute when Florence was visited by Domenico Venetiano, who had learned from Antonello da Messina the new method of painting in oil and varnish, till then unknown in Tuscany. The splendor of this mode of coloring was much admired, and by a pretended friendship for Domenico, Castagno obtained his secret; but not satisfied with this he desired to be the sole possessor, and determined to murder his friend and benefactor. This he effected without any suspicion, and continued to practise his ill-acquired art with great success. The real author of this atrocious act was never discovered until Andrea made a full confession of his guilt shortly before his death. The best of his remaining works are at Florence, in the church of St. Lucia de Magnuoli, and in the monastery Degli Angeli. The latter contains a crucifixion by him painted on a wall.

Castaigne, André, ăn-dră kăs-tăn, French artist: b. Angoulême 1861. He studied at the Suisse Academy and at the École des Beaux Arts in Paris; he exhibited at the Paris Salon in 1884 and several times in later years. Among his pictures are 'Dante and Beatrice'; 'The Deluge'; 'Portrait of Vicomte de Dampierre'; and 'After the Combat' (in the Peabody Gallery at Baltimore). In 1890 he came to the United States and remained here until 1895. He was director of an art school in Baltimore and in 1891 began the illustrating work by which he is best known to the American public. His first work of this character was 'The Forty Niners' Ball' in the 'Century Magazine' for May 1891; since then he has illustrated for several of the leading magazines; his designs include the pictures of the Texas cowboys in 'Scribner's Magazine' and the World's Fair drawings and illustrations for 'Polly' in the 'Century.' On his return to France he became instructor in the Colarossi Academy and opened a studio in Paris. See 'The Critic' Vol. XXIII, 57; 'The Book-buyer' XII, 506.

Castă'lia, a celebrated fountain in Greece, the sacred spring of the Delphic oracle, at which all the pilgrims to Apollo's shrine were obliged

to purify themselves. It issues from a fissure between two peaked cliffs, which form the summit of a semicircular range of rocks, anciently called the Phædriades. These immediately adjoin Mount Parnassus, and rise to the height of 2,000 feet. The Castalian spring was said to impart poetic inspiration to those who drank of it, but it was only latterly by the Roman poets that it was invested with this tribute. It is now called the Fountain of St. John, from a small chapel dedicated to St. John which stands near its source.

Castalides, kăs-tăl'î-dēz, the Muses, so called from the fountain Castalia, at the foot of Parnassus.

Castalio, Sébastien, sâ-băs-tē-ôn kăs-tăl-yô, French theologian: b. Dauphiny 1515; d. Basel 20 Dec. 1563. His original name was Châteillon. Through the influence of Calvin he was made professor of classical literature at Geneva. Having quarreled with the reformer, who caused his banishment in 1544, he repaired to Basel, where he taught the Greek language; but as his stipend did not suffice to support his numerous family, he was compelled to employ part of his time in agricultural labors. He made a Latin translation of the Bible, the best edition of which is in folio, Basel, 1573. He defended the right of free discussion in a collection of maxims compiled from various sources.

Castă'nea, a trade name for the Brazilnut and the genuine name for the chestnut (qq.v.).

Cas'tanets, small wooden rattles, made in the shape of two bowls or cups, fitted together and tied by a string, and then fastened to the thumbs. The fingers being rapidly struck upon them, a tremulous sound is produced, which marks exactly the measure of the dance. Something similar to this was the *krotalon* of the ancients, who also made use of small cymbals in their dances and festivals in honor of Bacchus. It is probable, however, that they had their origin in the East, and were brought by the Moors into Spain. Here, too, they received their name *castañuelas*, from being commonly made of the wood of the chestnut (*castaño*), or from their color. They are still in use in Spain, and here and there in the south of France. The charm of variety has also procured for them a place in ballets and operas.

Castanheda, Fernao Lopez de, fēr-nă'o lô'-păth dă kăs-tan-yă'dă, Portuguese historian: b. Santarem about 1500; d. Coimbra 23 March 1559. His father having been appointed to an important post in India, he was taken thither in youth, and was thus led to make the careful and unremitting researches embodied in the 'History of the Discovery and Conquest of India by the Portuguese' (1551-61), a work upon which Camoens drew largely in the course of his epic activity.

Castă'ños, Don Francisco Xavier de, frăn-thēs'kô nă-vē-ăr' dă kas-tă'nôs, Duke of Baylen, Spanish military officer: b. Madrid 22 April 1756; d. Madrid 24 Sept. 1852. Educated in military science in Germany, on the invasion of the country by Napoleon, he received the command of a division of the Spanish army, and in July 1808 compelled 18,000 French, under Gen. Dupont de l'Étang, to surrender at Baylen, but was in turn defeated by

Lannes in November of the same year at Tudela. Under Wellington he served as general of the 4th Spanish *corps d'armée*, and took part in the battles of Albuera, Salamanca, and Vittoria. In 1815 he was placed at the head of the Spanish army for the invasion of France, which was rendered unnecessary by the victory at Waterloo. In 1825 he was called to the State Council, where he became a decided opponent of the Carlist party.

Caste, a social class whose burdens and privileges are hereditary. The word is from the Portuguese *casta*, race, and was applied by the Portuguese, who became familiar with Hindustan, to the classes in India whose occupations, privileges, and duties are hereditary. This term is sometimes applied to the hereditary classes in Europe; and we speak of the spirit or the prerogatives and usurpations of a caste, to express particularly that peculiar constitution of society which makes distinction dependent on the accidents of birth or fortune. The division into castes, where it appears in its most typical form, comes to us from a period to which the light of history does not extend; hence its origin cannot be clearly traced; but it is highly probable that wherever it exists it was originally grounded on a difference of descent and in modes of living, and that the separate castes were originally separate races of people. This institution has been found among many nations. According to the accounts collected by Clavigero, some traces of it were apparent among the Peruvians and Mexicans; but it prevails principally in the East, where it has existed from the earliest times, and has become blended with the political condition of the people. The division into castes was entirely interwoven in the whole fabric of civil society, in ancient Egypt and India. In Egypt this division was perfected as a political institution in the flourishing period of the Pharaohs; and the lines of separation which had been drawn in earlier times by a difference of descent and different modes of living were then rendered still more distinct. The number of castes in that country is variously stated by Herodotus, Plato, Diodorus, and Strabo. The institution of caste, however, is best known to us as it exists in Hindustan, where it is well known to have existed since perhaps 1,500 or 2,000 years before the Christian era. The great Indian castes are four in number, namely, the Brahmans or sacerdotal class; the Kshatriyas or military class; the Vaisyas or mercantile class; and the Sudras or servile class. The three castes first named are regarded as being altogether of a higher character than the fourth, rejoicing in the peculiar religious distinction of being "twice-born" as contrasted with the "once-born" Sudras. This distinction is undoubtedly ethnical in its origin, the twice-born castes being descendants of the Aryan invaders and conquerors of the country, while the once-born are the representatives of the conquered. Caste, however, is a much more complicated thing than would be supposed from this brief statement, since the principle of caste classification according to employment as well as to race has long prevailed, and from early times there has been an intricate mingling of castes. The Brahmans are the sacerdotal caste, but, according to Sir W. W. Hunter (*The Indian Empire*, 2d edition, 1893), "Even among the Brahmans, whose pride of race and continuity of

tradition should render them the firmest ethnical unit among the Indian castes, classification by employment and by geographical situation, plays a very important part; and the Brahmans, so far from being a compact unit, are made up of several hundred castes, who cannot inter-marry nor eat food cooked by each other. . . . In many parts of India, Brahmans may be found earning their livelihood as porters, shepherds, cultivators, potters, and fishermen, side by side with others who would rather starve, and see their wives and little ones die of hunger, than demean themselves to manual labor, or allow food prepared by a man of inferior caste to pass their lips." Altogether some 1,886 separate Brahmanical tribes have been enumerated, and the Kshatriyas or Rajputs now number 590 tribes in different parts of India. "In many outlying provinces we see non-Aryan chiefs and warlike tribes turn into Aryan Rajputs before our eyes. Well-known legends have been handed down of large bodies of aliens being incorporated from time to time even into the Brahman caste." While there has been a tendency in the different provinces for every separate employment to develop into a distinct caste, there are also instances of castes changing their employment and raising themselves in the social scale. Thus the Vaisyas, who were anciently that Aryan caste upon whom the tillage of the soil fell, have become the merchants and bankers of India, leaving to the Sudras and mixed castes the labor of cultivation. "Each caste is to some extent a trade-guild, a mutual assurance society, and a religious sect. As a trade union it insists on the proper training of the youth of its craft, regulates the wages of its members, deals with trade delinquents, supplies courts of arbitration, and promotes good fellowship by social gatherings. . . . The caste or guild exercises a surveillance over each of its members, from the close of childhood until death. If a man behaves well he will rise to an honored place in his caste; and the desire for such local distinctions exercises an important influence in the life of a Hindu. But the caste has its punishments as well as its rewards. The fine usually takes the form of a compulsory feast to the male members of the caste. This is the ordinary means of purification or of making amends for breaches of the caste code." A person who has become an "out-caste," or lost his caste position and privileges, may generally recover them in this way.

Castel Nuovo, kās'tēl nwō'vō, or **Novo**, Austria, a town and commune of Dalmatia, in the circle of Cattaro. It stands near the entrance to the Gulf of Cattaro, and is surrounded by walls which have suffered much from repeated sieges and earthquakes. It contains two churches, a Roman Catholic and a Greek; a lazaretto, and custom-house. The chief manufacture is in articles of brass. The country around is beautiful and fertile. The population of the town is small, but that of the commune is about 10,000, most of whom belong to the Greek Church.

Castel Vetrano, kās'tēl vā-trā'nō, Sicily, a town in the province and 27 miles southeast of Trapani, on a rocky hill. It lies in a fertile district, is regularly built, has several churches, grammar school, with municipal museum, etc. The white wine produced in the neighborhood

CASTELAR—CASTELLIO

is esteemed the best in Sicily. Articles of coral and alabaster are manufactured here. Pop. (estimated) 25,000.

Castelar, kas tā lār, **Emilio**, Spanish statesman: b. Cadiz 8 Sept. 1832; d. Murcia 25 May 1899. He studied at Madrid, and in 1856 became professor of history and philosophy in the university there. He began early to write on letters and politics in the newspapers and magazines, and in 1864 started *La Democracia* (*The Democrat*), in the pages of which he inveighed fiercely against the government. After the abortive rising of 1866 he was condemned to death, but contrived to escape to Paris, returning when the revolution of 1868 began. All his ardor and eloquence could not hinder the crowning of King Amadeus, though it helped to bring about his downfall in 1873. In September of that year the Cortes made Castelar dictator, but the orator proved somewhat ineffectual in action, and found himself unable to crush either the "red demagoguery of Socialism on the one hand, or the white demagoguery of Carlism" on the other. In the beginning of 1874 a hostile vote in the Cortes obliged him to resign, and soon after the *pronunciamiento* in favor of Alfonso XII. drove him across the frontier. He returned to Spain in 1876, and was returned to the Cortes, where, till his retirement in 1893, he often spoke with all his old eloquence. His chief writings are: 'Civilization' (2d ed. 1865); 'Questions, Political and Social' (3 vols. 1870); 'Parliamentary Discussion' (3 vols. 1871); 'History of the Republican Movement in Europe' (2 vols. 1874); 'The Oriental Question' (1876).

Castelein, Matthijs de, mā-tē'is de kās'tē-lin, Dutch poet: b. Pamele (Oudenarde) 1485; d. 1550. He was the acknowledged lawgiver and pattern of all the Dutch rhetoricians of his time, in his 'Art of Rhetoric.' He composed many plays, but only two of them were published; one of these is the 'Story of Pyramus and Thisbe.' He wrote also 'Ballads' and a volume of 'Varicus Lays,' in melodious verse.

Castellamare, kās-tēl-la-mā'rē, or **Castellammare**, Italy, a seaport town on the Gulf of Naples, 17 miles southeast of the city, at the beginning of the peninsula of Sorrento, and 10 miles northeast of that town. It extends for a mile along the shore at the base and on the slope of a spur of Monte Sant' Angelo (4,735 feet high), a mountain which commands a splendid prospect. From its pleasant surroundings, shady walks, sea baths, and other attractions, it is a favorite summer resort of the Neapolitans, as well as tourists, and has several good hotels, one of them formerly a royal residence. The harbor is protected by a mole, and there is an arsenal with a dockyard. The town owes its name to a castle built by the Emperor Frederick II. in the 13th century. Castellamare occupies the site of the ancient Stabiae, overwhelmed, with Herculaneum and Pompeii, by an eruption of Vesuvius, 79 A.D.; and it was here that the elder Pliny met his death by approaching too near to the mountain when in a state of eruption. The modern town was afterward built from the ruins of Stabiae. Pop. about 33,000.

Cas'tellan, or **Chatelain**, properly the owner or commander of a castle. In Flanders and France the title went with the possession of certain districts, and in Normandy and Bur-

gundy châtellains ranked next after bailiffs, with both civil and military authority. In Germany the châtellains were imperial officers with military and civil jurisdiction in fortified places.

Castellane, **Esprit Victor Elizabeth Boniface**, ës-prē vëk-tôr â-lë-zà-bët bôn-i-fas, Count of, French marshal: b. Lyons 1788; d. 1862. He entered the army in 1804, and took part in most of Napoleon's campaigns. After the restoration he became colonel of the Hussars of the Royal Guard. He fought in Spain (1823), and at the siege of Antwerp (1832), and as lieutenant-general commanded the Army of the Pyrenees. In the February revolution (1848), he lost his command, and in consequence went over to Louis Napoleon. In 1850 he became commander at Lyons, and in 1852 marshal and senator. His 'Memoirs,' published in 1896, though crude in style, are valuable for their mass of minute detail.

Castelli, **Benedetto**, bā nā dët'tō kās-tēl'lë, a pupil of Galileo: b. Brescia 1577; d. 1644. He was a monk and became abbot of a Benedictine monastery of the congregation of Monte Cassino. He afterward became a professor of mathematics, and taught with distinguished success both at the University of Pisa and at the Collegio della Sapienza at Rome. Torricelli was his pupil. He distinguished himself in hydraulics, and rendered important services to Urban VIII in his projects for the regulation of Italian rivers. He may be regarded as the founder of that branch of hydraulics which relates to the velocity of running water, though his fundamental principle, that the velocity is proportional to the height of the reservoir, is inaccurate, and was demonstrated to be so by Torricelli, who showed that the velocity is proportioned, not to the height, but to the square root of the height. In his investigations as to the measurement of time Castelli made use of the pendulum. His principal work, entitled 'Della Misura dell' Acque Correnti,' published at Rome in 1628, was translated into French in 1664.

Castelli, **Ignaz Franz**, Austrian dramatist: b. Vienna 6 May 1781; d. there 5 Feb. 1862. He was educated for the law, but following his inclination for the drama, gained access to the orchestras of theatres as a player of the violin. His circumstances compelling him to look out for some means of support, he accepted various subordinate offices, but using his leisure in composing patriotic songs for the Austrian army, he was brought into favorable notice. His songs having given umbrage to Napoleon, he fled to Hungary. In 1815 he accompanied Count Cavriani as secretary to Paris, and afterward he served in the same capacity with Baron Munch von Bellinghausen in Upper Italy. In 1840 he retired with a pension and the office of state librarian. The author of many poems, popular songs, and miscellaneous writings, he was at various times connected with the press of Vienna, but is best known by his voluminous productions for the stage. Over 100 plays, partly adapted from the French, partly original, are attributed to him. In 1848, more than 100,000 copies of his political pamphlets in favor of the Revolution found eager purchasers.

Castellio, kās-tēl-li-ō, **Sebastianus**, French theologian and humanist, translator of the Bible into pure and classic Latin; he was a native of

CASTELLO—CASTI

Dauphiny: b. 1515; d. Basel 1563, in exile and in extreme poverty. His family name was Châteillon, which he latinized after the fashion of that time into Castello. At the invitation of Calvin he settled at Geneva, where he became professor of the ancient classic literatures, but because of differences regarding questions of religious belief he was deposed from the professorship and banished from Geneva. His Latin version of the Bible retained little or nothing of the profoundly Hebrew character of the scriptural writings, and was justly censured by Calvin and the Calvinists. Theodore Beza, to offset this "work of Satan," as he called it, made a Latin translation of the Bible himself, striving to retain the Oriental flavor of the original in every respect. Castello also wrote a book in defense of the right to hold and publish views deemed by Church and state to be heretical; this, too, evoked a reply from Beza. Castello wrote also a tractate on 'Predestination Opposed to the Views of Calvin'; it was published after the author's death by Faustus Socinus in 1578.

Castello, kas-těl'lō, **Gabriel Lancelot**, Italian antiquary: b. Palermo 1727; d. 1794. He was descended from a noble family, and was placed under a private tutor with a view to study botany, chemistry, etc.; but accidentally meeting with some old coins which had been dug up by a plowman, he was seized with a great desire to decipher them, and from that time devoted himself to antiquarian pursuits. He formed a splendid collection of the remains of antiquity found in Sicily, and his museum was always open to foreigners as well as to natives. On his death-bed he bequeathed a large quantity of books, etc., to the public library of Palermo. At his death he was honorary member of the Royal Society and of the Academy at Paris. He published several works.

Castello-Branco, Camillo, ka-měl'lō kās-těl'lō bran'kō, Portuguese novelist and poet: b. Lisbon 16 March 1826; d. 6 June 1890. He is the most popular of the modern romancists of Portugal, and at the same time the most national in tone, spirit, and form. Realism characterizes his numerous novels (over 100), the best known being: 'Love of Perdition' (1862); 'The Marquis of Torres Novas'; 'Brilliant from Brazil.' All of them are genuine pictures of Portuguese life. Among his poetic compositions, the collection published under the title, 'A Book' (1854), holds the first place.

Castellon, Francisco, frän-chēs'kō kās-těl-yōn', Nicaraguan revolutionist: b. about 1815; d. 2 Sept 1855. He was the leader in a revolt at Leon in 1853, which was unsuccessful, and fled to Honduras, whence he returned in June of the next year. It was by his invitation that the filibustering expedition under William Walker went from the United States in 1854.

Castellon de la Plana, dā la plā'nā, Spain, capital of the province of Castellon, 40 miles north-northeast of Valencia. It stands in a large and fertile plain, watered by the Mijares, from which an ample supply of water is brought into the town by an aqueduct supposed to have been constructed by Jayme I. of Aragon, who, in 1233, wrested Castellon from the Moors. It is well built, and has considerable manufactures of sailcloth, and woolen and hempen fabrics, ropes, paper, soap, etc., and some trade in hemp, grain, and fruit. The painters Ribalta, father

and son, were born here. Pop. of town 31,272; of province, 304,477.

Castelnau, kas-těl-now, **Francis (COMTE)**, French traveler: b. London 1812; d. Melbourne, Victoria, 4 Feb. 1880. He traveled extensively in Canada, the United States, and Mexico, and under the protection of the French government undertook an exploration of South America in 1843, accompanied by D'Osey, a botanist; Weddell, a botanist; and Deville, a taxidermist. After his return to France, in 1847, Count Castelnau published 'Expedition dans les parties centrales de l'Amerique du Sud' (1850-1), a work in six volumes, of which one was by M. Weddell. Castelnau afterward traveled in Arabia, and was successively consul at Bahia, the Cape of Good Hope, and Singapore, and at the time of his death was consul-general at Melbourne.

Castelnaudary, kās-těl-nō-dā-rē, France, a town in the department of Aude, on a height above the Canal du Midi, 22 miles west-northwest of Carcassonne. It was built by the Visigoths on the site of a rich town which had been destroyed, and was named Castellum Novum Arianorum, from which its present name is corrupted. It rises in the form of an amphitheatre, and was anciently the capital of a district, and strongly fortified. It was the scene of much barbarity by the inquisitors in 1237, was almost totally destroyed by Edward the Black Prince in 1355, and is famous for the battle fought beneath its walls in 1632 between the troops of Louis XIII. and those of Gaston of Orleans, which resulted in favor of Louis chiefly in consequence of the inactivity of the Duke of Orleans. The Duke of Montmorency was wounded in this battle and taken prisoner, and afterward executed at Toulouse by order of the king, Louis XIII. It is indifferently built, but has manufactures of coarse cloth, several distilleries and tanneries, and one of the largest grain and flour markets in the south of France. Pop. about 10,000.

Castelnovo, Leo di, lā'ō dē kās-těl-nō'vō. See PULLE, LEOPOLDO, COUNT.

Castelnuovo, Enrico, ĕn-rē'cō kās-těl nwō vō, Italian novelist: b. Florence 1839. His stories have attained great popularity; among them: 'Prof. Romualdo' (1878); 'Two Conventions' (1885); 'Reminiscences and Fancies' (1886). He is one of the acknowledged Italian masters of the "novel of the inner life" (romano intimo).

Castelvecchio, Riccardo, rē-cār'dō kās těl vĕk'ē-ō. See PULLE, GIULIO, COUNT.

Casti, Giambatista, jām-bā-tēs'tā kās'tĕ, Italian poet: b. Prato, in the vicinity of Florence, 1721; d. 7 Feb. 1803. He studied at Montefiascone, became professor there, was appointed a canon, and made a journey to France. Receiving an invitation from the Prince of Rosenberg, who became acquainted with him in Florence, he went to Vienna, and was presented to Joseph II., who knew how to appreciate the genius of the poet, and delighted in his conversation. Casti took advantage of every opportunity of visiting other courts, and joined several embassies without office or title. Catherine II. received him in the most flattering manner. He visited also the court of Berlin, and several other German courts. After his return

to Vienna, Prince Rosenberg, the director of the Imperial Theatre, caused him to be appointed *poeta Cesareo* on the death of Metastasio. After the death of Joseph II. Casti requested his dismissal, and retired to Florence, where he wrote many of his works. In 1783 he went to Paris. His 'Novelle Galanti' were republished at Paris 1804, under the title 'Novelle di Giamb. Casti,' in three volumes. They are 48 in number. Almost all are of a licentious character, but written in a lively, original, and graceful style. The same may be said of his didactic-satirical poem, 'Gli Animali Parlanti,' Poema Epico di Giamb. Casti' (Milan 1802, 5 vols.). There are translations of it in French, German, and English. Casti's 'Rime Anacreontiche' are pleasing, and his comic operas, 'La Grotta di Trofonio' and 'Il Re Teodoro in Venezia,' etc., are full of wit and originality.

Castiglione, Baldassare, bäl-däs-sä'rä käs-tël-yō'nä, Italian writer: b. Casatico, in the territory of Mantua, 1478; d. 8 Feb. 1529. He studied at Milan, and entered into the services of the Duke Ludovico Sforza, and afterward of the Duke of Urbino, of whose elegant and splendid court he soon became an ornament. By him he was sent as an envoy to Henry VII. of England, and afterward in the same capacity to Louis XII., at Milan. In 1513 Castiglione appeared as ambassador at the court of Leo X., where he became intimate with the most distinguished literati and artists. In 1521 he obtained for the new Duke of Urbino, Federigo, the command of the Papal troops, and in 1524 was employed by Pope Clement VII. to conduct his negotiations with Charles V. When Rome was plundered by the Constable of Bourbon in 1527 he was accused of negligence, and his health was undermined by chagrin. He refused to accept the rich bishopric of Avila, which was offered to him by the emperor, until the Pope should be reconciled with Charles. Among his works, the 'Libro del Cortegiano' is the most celebrated. It teaches the art of succeeding at court. His few Italian and Latin poems are elegant. His letters are valuable contributions to political and literary history.

Castiglione, Carlo Ottavio, COUNT, Italian scholar: b. Milan 1784; d. Genoa 10 April 1849. His *magnum opus*, published in 1826, is a work in which he seeks to ascertain the origin and the history of the towns in Barbary whose names are found on Arabic coins. Out of Italy, however, he is best known by his edition of some fragments of the Mæso-Gothic translation of the Bible by Ulfilas, which had been discovered in 1817 by Cardinal Mai among the palimpsests of the Ambrosian Library.

Castiglione, Giovanni Benedetto, jō vān nē bā-nā-dēt'tō, Italian painter: b. Genoa 1616; d. 1670. He was a pupil of Paggi, Ferrari, and Antony van Dyck, studied at Rome, Florence, Parma, and Venice, and formed his style on the best masters. He is particularly celebrated as a painter of animals, and in these subjects, as well as his other paintings, is remarkable for softness, elegance, and beauty. Of his larger pieces, the most celebrated are the 'Creation of the Beasts,' 'Their Entrance with Noah into the Ark,' and 'Jacob's Return with His Family and Servants, His Flocks, and Herds'—all in the Brignol Palace. He also

distinguished himself as an engraver, and from his skill in the production of light and shade has been called the second Rembrandt.

Castiglione Del Stiviere, dël stēv-yā'rā, Italy, a small city in the province of Mantua, 17 miles southeast of the town of Brescia, 22 miles northwest of Mantua. It is well built, surrounded by walls, defended by an ancient castle, and contains a large square adorned with a central fountain, three churches, and a town hall. A well-attended annual fair is held in June. The French obtained here a decisive victory over the Austrians on 5 Aug. 1796, which gave to Marshal Augereau his title of Duc de Castiglione.

Castile, New. See NEW CASTILE.

Castilho, Antonio Feliciano, ān-to'nē-ō fā-lē-chē-ā'nō kās-tēl'yō, Portuguese poet: b. Lisbon 26 Jan. 1800; d. 18 June 1875. Though almost blind, he studied jurisprudence at Coimbra. His first poetical composition, 'Letters of Echo and Narcissus,' published while he was a student, won him great celebrity. He excelled in pastorals; and to this class belong his 'Spring' and 'Love and Melancholy, or the Latest Heloise.' He had a deep sympathy with nature, and was a master of elegiac verse.

Castilla, kās-tēl'yā, Ramon, Peruvian soldier and politician: b. Tarapaca 30 Aug. 1796; d. there 30 May 1867. He served in the Spanish cavalry until 1821, when Gen. San Martin proclaimed Peruvian independence. Castilla, then a lieutenant, joined the liberating army, in which he distinguished himself. He was elected president of Peru in 1845. At the expiration of his term of office, in 1851, he was succeeded by Gen. José Rufino Echéñique, but usurped the power in 1855, and was, by a majority of 70,374 votes, re-elected to the presidency in August 1858. After being succeeded by San Roman in 1862, Castilla lived in retirement till his appointment to the presidency of the senate in 1865.

Castillejo, kās-tēl-yā'hō, Christoval de, Spanish poet, the last representative of the ancient Spanish poetry: b. Cindad Rodrigo about 1494; d. Vienna 12 June 1556. He opposed the introduction of Italian styles into the poetry of Spain, and justified his opposition by demonstrating in his own work the competence of the traditional styles of Spain for the expression of all moods and all sentiments. His satiric vein, especially in the 'Dialogue on the Condition of Women' and the 'Sermon on Loves,' offended both clergy and laity.

Castilloa Elastica, a lofty forest-tree, belonging to the Bread-fruits (*Artocarpacæ*). Some specimens have near the tree a circumference of from 10 to 12 feet. The tree is native to southern Mexico and the Central American countries, and supplies the Central American rubber of commerce. This rubber, instead of being molded, as is Para rubber, is made into sheets (hence called sheet-rubber), and hung up to dry. *Castilloa elastica* has been found to be cultivable in India and Ceylon.

Castillon, kās-tē-yōn, France, a town in the department of Gironde, on the right bank of the Dordogne, 33 miles east of Bordeaux by rail. Beneath its walls, on 13 June 1453, the English met with a signal defeat, their leader, Earl Talbot of Shrewsbury, and his son, being slain. Part of the battle is described in the fourth act of Shakespeare's 'King Henry VI., Part I.'

CASTINE — CASTING

Castine, Vincent, vǎn-sǒn kās-tēn, **BARON DE,** French soldier: b. Oleron 1650; d. 1722. He went to Canada in 1665, established a mercantile house at Penobscot (now the town and port of entry of Castine, Me.), in 1687, and married the daughter of the Penobscot chief. In 1696 he captured Pemaquid, at the head of 200 Indians. He assisted in the defense of Fort Royal, in 1706, and was there wounded the following year. His son, who succeeded him in command of the Penobscots, was made prisoner and taken to Boston in 1721.

Casting, the running of melted metal into a mold, so as to produce an object in metal having the shape of the mold. Iron-casting or iron-founding is carried on by three methods, the first called "open sand-casting," the second, "sand-casting between flasks," and the third, "loam-casting." In most of these an exact pattern, usually of wood, is employed by the founder. The floor of every foundry is composed, for several feet deep, of a loamy sand, in which deep pits may be sunk to bury large molds. This floor must be kept exceedingly dry, and free from any wet or moisture, otherwise the melted matter, converting the watery particles into vapor, would blow up the building and destroy the workmen. In the place where the mold is to be made, a layer of sand is lightly sprinkled through a sieve on the floor, and the wooden pattern pressed firmly down into it, level with the surface. The sand is then to be shoveled up all around, level with the top of the pattern, and rammed down with a tool. A moist sponge is then used for slightly wetting the sand all round the edges of the pattern, to make its particles adhere together. The next operation is lifting the pattern out of the sand by one or more screws, screwed into the wood. If the pattern is small, this can be easily done by one or more men; but in very large works it is effected by a crane. The workman then uses a pair of bellows for blowing away any small pieces of sand which may have fallen into the mold, and then sifts some finely powdered charcoal over its surface. It is now ready for filling with metal. In small works this is done by ladles and in large by small channels made in the sand, leading from the mold to the mouth of the furnace. When the mold is filled, the hot metal is covered with sand to keep the air from it while it is cooling.

Sand-casting between flasks is used for more complex articles than the former; such, for instance, as if they were cut into two or more pieces (provided the cutting planes were parallel to each other), each separate piece might be cast in open sand. The flasks are iron frames furnished with four handles, by which they may be lifted, and having iron points fitting into holes prepared in the other flask for joining them accurately together. The under flask being placed upon a board, filled with sand, and the sand rammed tight into it, the workman then takes the pattern and presses one half of it into the sand, and smooths the sand up to the sides of it with a trowel; he then sets the empty flask over the other, adjusting its points to the holes, and after sprinkling some sand which has been burned (to free it from moisture) over the sand in the under flask, he fills the upper one with sand, and rams it down; he next, with a piece of wood, put through the sand in the upper

flask, makes a hole to pour the metal through. The upper flask, with the sand in it, is then raised off by men by the handles, or in large works by a crane, and the pattern lifted out. The flask is then put on again, and heavy weights laid upon it to keep it down ready for casting. It must be observed that at every uppermost point of large molds a small hole must be bored through the sand in the upper flask, to allow the rarefied air to escape out of the mold when melted metal is poured in. To save expense it is now customary to make flasks of any size that may be wanted, out of rectangular iron plates, which are fitted together by means of screws and bolts. This obviates the necessity of keeping a large store of flasks of different sizes, and enables the caster to adapt the form of the flask to that of the model for which it is intended.

Loam-casting is used for bulky, hollow articles, such as cylinders, large pipes, caldrons, boilers, etc., and is conducted in this manner: If, for instance, a large cylinder is to be cast, a mold has first to be made as follows: To a beam in the roof of the foundry is affixed a perpendicular spindle, with three or four holes through it to fix an iron arm in, at different heights, by means of a nut. This arm has two bars placed at such a distance as to be capable of receiving a wooden plank, which can be firmly secured to them by means of two clamps. The operation is then begun by laying an iron ring upon the ground, and adjusting it so as to be concentric to the spindle. A cylinder of brickbats, or clay and wet loam (instead of mortar), is then built upon it, some inches less in diameter than the intended cylinder, for which this is to form a core; the brickbats are then firmly bound together with iron hoops, annealed wire, etc., and a fire is lighted within the erection to dry it. When the loam used between the bricks is dry, a coating of loam is spread over the whole, and is perfectly smoothed by causing the edge of the perpendicular board to revolve round it. This coat makes it of the proper size for the inside of the cylinder to be cast, and is called the core of the mold. Another cylinder is built, plastered, and smoothed in the same way (except that no hoops are used), whose diameter is the same as the outside of the cylinder to be cast. When this is finished it is covered with a coating of charcoal, ground up with water like paint, laid on with a brush, and a thin coating of loam is laid on; this is bound round with hoops, and to these four hooks are fixed to lift it by; a thick coat of loam and hair is then laid over it. When all these are dry a man gets down into the cylinder, and with a small pick pulls down all the bricks in the inside cylinder, and then with a trowel cuts away all the loam, leaving the inside of the external cylinder (which is called the mold) quite smooth. This is effected by the coating of powdered charcoal, which prevents the two coats of loam from adhering. A deep pit is now dug in some convenient part of the foundry, into which the core is let down by a crane. The core being placed in the pit, the mold is let down after it by the same means; and when they are adjusted, the sand is thrown and rammed round about half the height; a flat cover of dried loam is then put on the top of the mold and core, and round pieces of wood are put in the holes which had before been made in the cover for pouring the metal in. The burying of

CASTING AWAY OF MRS. LECKS AND MRS. ALESHINE—CASTLE

the mold is then completed. When it is all leveled, the sticks which keep open the holes for the metal are carefully withdrawn, and small channels made from the furnace to allow the melted iron to find its way to the mold. When the form is more complicated, as in pear-like shapes, etc., where a man cannot be introduced to pick out the bricks, the mold must be sawn in two perpendicularly with a fine saw to get it off. It is then put together again round the core, and the crack plastered up with loam.

Casting Away of Mrs. Lecks and Mrs. Aleshine, The, a story by Frank R. Stockton. This chronicle sets forth the curious experiences of Mrs. Lecks and Mrs. Aleshine; two middle-aged widows, from a little New England village, who, having "means," decide to see the world and pay a visit to the son of one of them, who has gone into business in Japan. On the steamer crossing the Pacific they meet a young Mr. Craig, who tells the story. The two ladies and Mr. Craig are cast away in most preposterous circumstances, on a lonely isle in mid-ocean. Many of the scenes, like the escape from drowning of the two widows, are of the very essence of true humor, of a grotesque form; and the story-teller's invention never once flags. The tale presents, intentionally of course, neither evolution nor climax, but only a succession of the oddest incidents. It is a good example of Stockton's unique method of story-telling—the matter extremely absurd and the manner extremely grave, the narrative becoming more and more matter-of-fact and minutely realistic, as the events themselves grow more and more incredible.

Castle, Edmund, English Orientalist: b. 1606; d. about 1685. His life was spent mainly in the compilation of his 'Lexicon Heptaglotton Hebraicum, Chaldaicum, Syriacum, Samaritanum, Ethiopicum, Arabicum et Persicum' (1669), the Syriac division of which is still considered valuable, and he also aided Walton in the preparation of his 'Polyglot.'

Castle, Egerton, English author: b. 12 March 1858. He was educated at Glasgow University and Cambridge. After a brief military career he turned to literature and journalism, and has written: 'Schools and Masters of Fence' (1884); 'Bibliotheca Dimicatoria' (1891); 'Consequences' (1891); 'La Bella and Others' (1892); 'English Book Plates' (1892); 'Saviolo,' a play (1893); 'The Light of Scarthey' (1895); 'The Jerminham Letters' (1896); 'The Pride of Jennico' (1898); and 'Young April' (1899); 'Desperate Remedies,' a play; 'The Bath Comedy' (1899); 'Marshfield the Observer'; 'The Secret Orchard' (1900); 'The House of Romance' (1902). The last named novel with 'The Pride of Jennico' and 'The Bath Comedy' were written jointly by Mr. Castle and his wife, Agnes Castle.

Castle, a word derived from the Latin *castellum*, a diminutive of *castrum*, a fortress or stronghold. The word *castellum* was frequently applied by the Romans as a military term to denote a redoubt. The word has come to be used as the designation of those strongholds which, in feudal times, served at once as residences and as places of defense for the nobles, and which continued to exist until the invention

of gunpowder changed the whole system of fortification. The royal residences among the Franks resembled in some points both the Roman villa and the Roman camp, and those of the Frankish nobles differed little from those of the kings, except in point of simplicity. Strictly speaking, only the grand feudatories had the right to erect fortified castles, and then only after receiving the royal consent; but the grand feudatories very early began to take it upon themselves to grant the privilege of erecting castles to their vassals, and these again to those of a still lower grade. In this way large numbers of castles began to spring up at an early period in France, Germany, England, and elsewhere.

The castles of the Norman Conquest in England were probably the first stone buildings erected there. The great square keep of Rochester Castle is probably of this period; it is about 70 feet square, with projecting corner turrets, and as it now stands is 100 feet high, but the battlements have been altered and its original character lost. A heavy wall divides the huge structure into two nearly equal parts, and within this wall a well is arranged which communicates with all three stories; the outer walls are 12 feet thick at the base and the masonry is very perfect. Little is known of the ancient disposition of the minor buildings. There is no doubt that a high and battlemented wall enclosed a court or perhaps two courts, an inner and an outer bail, as they are called; that the keep was enclosed by the inner bail, but always so near the wall that a postern could communicate with the outer moat, and that within the enclosing wall, often built up against its interior face, were stables and storerooms, and also lodgings for the garrison, which last, however, might be temporary structures. This wall was always surrounded by a deep and broad moat, which might be filled with water in a low country, or, when dry, served merely to increase the effective height of the walls and to disarrange the approach of the besiegers. There was always a chapel, but in Rochester Castle this is built against the southeast corner of the keep and opens from its principal floor. In such an early castle the keep is the only very strong place, as a vigorous attack would breach or scale the outer wall very soon.

The castles of the 12th and 13th centuries were far more elaborate, and their tendency was toward separate posts, each defensible by itself. Every tower could be shut up and defended, its little garrison resisting even after the neighboring works had been captured or rendered indefensible. This arrangement had the disadvantage that a very bold and sudden attack might capture the strongest parts of the castle, even the keep itself, before assistance could come to it. The typical castle of the 12th century is the famed Chateau Gaillard in Normandy, and of the 13th century the famous castle at Coucy, near Laon in northern France; and in the British Isles, Kidwelly in Wales, which remains in a perfectly traceable condition.

The perfect castle was not developed until the time when gunpowder was about to make it useless. Thus the Chateau of Pierrefonds, north of Paris, and near Compiègne, was built about 1400, and in this the faults of the earlier castles were avoided. The walls are everywhere of nearly equal height, the galleries of de-

CASTLE GARDEN — CASTLE OF OTRANTO

fense are continuous so that the soldiers of the garrison may run easily the whole length of the walls, and these galleries are two or even three deep, allowing the defenders to throw a prodigious rain of projectiles upon any attacking party. These galleries, built of stone, replace the temporary wooden galleries, always put up on the walls of earlier castles when an attack was anticipated. It is to be noted that the attack and defense in mediæval fortifications was vertical; the higher the wall the more formidable was the blow delivered by a falling ball of stone, or a timber or iron bar; while the projectiles from crossbows and military engines would certainly lose nothing, and the garrison in this way was removed far above the assailant, who must come close under the walls to attack. This attack, then, consisted, in the case of a well defended place, chiefly in breaching or undermining the walls. Escalade was only possible where the garrison was weak or in poor condition or surprised.

Castles often had outer works, thus the barbican or barbacan is strictly a defense built outside of the principal gate, and intended to keep the enemy away from it for a certain length of time. When a castle was near a river an outwork would be built on the other bank, covering the bridge leading to the castle. When the site was high, with steep approaches, a covered way might be built to protect the whole of the path leading up to the castle, and the fort of this would have an outwork or strong post capable of some defense.

The introduction of fire-arms and especially of cannon heavy enough to breach the walls, compelled a change in the old castles, which were often ruined as consistent pieces of mediæval fortification by having their towers cut down to accommodate artillery of defense. A round stone tower 200 feet high would be cut down to a kind of bastion 30 feet high, with a parapet and embrasures for cannon around its platform. Even this was only temporary, for it was soon found that the effect of artillery fire was irresistible by stone walls, and these were abandoned for the sloping rampart of earth introduced in the 16th century. See FORTIFICATIONS.

The term castle was applied to the sea-coast forts which defended our modern sea-ports previous to 1870, and of which some still remain. It was held that the stone wall, 8 or 10 feet thick, carefully built of granite blocks, with the embrasures covered by wrought iron plates and allowing of a great accumulation of guns within a small space, were proof against the attack of a fleet; and this because the fire from the decks of ships cannot be so exact as to produce a breach. It was assumed that the enemy would not be able to make a landing near with effective guns. Thus, at the entrance to Savannah, Fort Pulaski was a "sea-coast castle" of that type, but it was breached in a few hours by the rifled guns landed on Tybee Island.

In modern English nomenclature, a name compounded with castle (such as Castle Howard, Berkeley Castle, and the like) is used for habitable buildings which may have been erected on the site or immediate grounds of an ancient building of defense or within its old walls; but this is a mere whim in the selection of an arbitrary name. On the other hand, Windsor Castle, the favorite residence of Queen

Victoria, has retained much of its mediæval defensive character, but the rooms inhabited by the royal family are of the reign of George IV., and the only part of the ancient work which remains in full use is the great chapel dedicated to St. George, a famous and beautiful building completed in the time of Henry VII.

RUSSELL STURGIS.

Castle Garden, the former immigrant depot in New York, at the point of Manhattan Island, in Battery Park. In the early days of the city the place was a small, fortified island a few feet from the mainland: later it became a public hall for assemblies and concerts. Here Jenny Lind made her American debut. Many years ago the island was incorporated with the general area of the Battery by filling the intervening space with earth and rock; new buildings were erected, and the place was devoted to the purpose of landing steerage immigrants. In 1890 it ceased to be used as an immigrant depot, and was turned over to the Park Commissioners of the city of New York. The old fort is now used as a public aquarium.

Castle of Otranto, *The*, by Horace Walpole. This story, with its natural personages actuated by supernatural agencies, is the prototype of that extraordinary series of romantic fictions which began with Anne Radcliffe, and was superseded only by the Waverley novels.

The reader's interest is aroused with the first page of the romance, and never flags. Conrad, son of Manfred, Prince of Otranto, about to marry Isabella, daughter of the Marquis of Vicenza, is found in the castle court, dashed to pieces under an enormous helmet. Now deprived of an heir, Manfred declares to Isabella his intention of marrying her himself; when, to his horror, his grandfather's portrait descends from the wall, and signs to Manfred to follow him. Isabella meanwhile, by the assistance of a peasant, Theodore, escapes to Friar Jerome. For this intervention, Manfred, now returned from his tête-à-tête with his grandfather's phantom, leads the youth into the court to be executed, when he is found to be Jerome's son, and is spared. At this moment a herald appears demanding of Manfred, in the name of Prince Frederick, his daughter Isabella, and the resignation of the principality of Otranto usurped from Frederick; who follows the proclamation, is admitted to the castle and informed of Manfred's desire to marry Isabella, when word comes that she has escaped from Jerome's protection. A series of ludicrous portents hastens the dénouement: drops of blood flow from the nose of the statue of Alphonso, the prince from whose heirs the dukedom has been wrested; unrelated arms and legs appear in various parts of the castle; and finally, in the midst of the rocking of earth, and the rattling of "more than mortal armor," the walls of the castle are thrown down, the inmates having presumably escaped. From the ruins the statue of Alphonso, raised to gigantic proportions, cries, "Behold in Theodore the true heir of Alphonso." Isabella, having been rescued at the critical moment, is of course married to Theodore.

This wildly romantic tale, published in 1764, was enthusiastically received by the public; who, as Mr. Leslie Stephen so well says, "rejoiced to be reminded that men once lived in

CASTLE PEAK—CASTOR AND POLLUX

castles, believed in the Devil, and did not take snuff or wear powdered wigs."

Castle Peak, in Mono County, California, lying to the north of Mono Lake in lat. 38° 10' N. It rises to about 13,000 feet above the sea.

Castle Rackrent, by Maria Edgeworth. This, as the author announces, is "an Hibernian tale taken from facts and from the manners of the Irish squire before the year 1782." The memoirs of the Rackrent family are recounted by Thady Quirk, an old steward, who has been from childhood devotedly attached to the house of Rackrent. The old retainer's descriptions of the several masters under whom he has served, vividly portray various types of the "fine old Irish gentleman." Sir Walter Scott has acknowledged that his original idea, when he began his career as a novelist, was to be to Scotland what Miss Edgeworth was to Ireland.

Castlebar, Ireland, the capital of County Mayo. It is on the Castlebar River, 10 miles northeast of Westport; has infantry and cavalry barracks, and some linen manufactures. In 1641 occurred here the massacre of the English Parliamentary army in the Irish rebellion; in 1789 Castlebar was held for a fortnight by the French general, Humbert; and in 1846-7 it suffered greatly from famine. Pop. about 4,000.

Castelford, England, a thriving manufacturing town in the West Riding of Yorkshire, on the Aire, here crossed by a bridge, 10 miles southeast from Leeds. The public buildings include the church of All Saints, several denominational chapels, schools, a market-hall, mechanic's institute, etc. There are numerous collieries in the neighborhood; and the town has extensive manufactures of glass bottles, earthenware, and chemicals. Pop. (1901) 17,382.

Castlemaine, Australia, a municipal town in the colony of Victoria, in the county of Talbot, at the junction of Barker and Forest creeks, 78 miles northwest of Melbourne, on the Melbourne & Echuca R.R., with branch communication by Maryborough with Ballarat. The town is pleasantly situated and well laid out, and the buildings, both public and private, are of a superior character. The principal public buildings are the town-hall, the hospital, the supreme court, and the mechanics' institute. Castlemaine owes its importance to the mining industry carried on in its neighborhood. Pop. (1901) 6,082.

Castlemon, Harry. See FOSDICK, CHARLES AUSTIN

Castlereagh, kās'ēl rā, **Robert Stewart**, VISCOUNT, English statesman: b. 18 June 1769; d. 12 Aug. 1822. He was educated at Armagh, and at St. John's College, Cambridge. He turned Tory in 1795, and next year became keeper of the privy seal; but he continued a steadfast supporter of Catholic emancipation. Still, he believed that emancipation with an independent Irish parliament would mean simply a transference of tryanny from the Protestant oligarchy to a Catholic democracy; hence, as chief secretary from 1797, he bent his whole energies to forwarding Pitt's measure of union. Transferred by the union from Dublin to Westminster, he accepted office in the Addington ministry (1802) as president of the board of control; but the true second era in his career was

as war minister under Pitt from July 1805 to January 1806, and again under Portland from April 1807 to September 1809. His real greatness begins with March 1812, when, as foreign secretary under Lord Liverpool, he became the soul of the coalition against Napoleon, which, during the momentous campaigns of 1813-4, was kept together by him, and by him alone. He represented England at the congresses of Chatillon and Vienna in 1814-5, at the Treaty of Paris in 1815, at the Congress of Aix-la-Chapelle in 1818; and he was preparing to start for a congress at Verona, when, in a fit of insanity, he committed suicide with a pen-knife at Foots Cray, his Kentish seat.

Castlereagh, Ireland, a barony in the County of Down. The castle stands on the summit of a Danish rath, and was once the seat of an O'Neil. It is now the property of the Marquis of Downshire. The barony gives the title of viscount to the Marquis of Londonderry.

Cas'tleton, England, a village in the County of Derby, situated at the bottom of a rugged eminence, on which stands the ancient castle called Peak Castle, erected by William Peveril, natural son of the Conqueror. The houses are chiefly of stone. It contains the parish church, a fine specimen of the early pointed style; two Methodist chapels, and a free grammar-school. The inhabitants are mostly employed in mining; but many derive a subsistence from the manufacture of ornamental articles from spar. It is the scene of Scott's novel, 'Peveril of The Peak.'

Cas'tletown, Great Britain, a seaport and former capital of the Isle of Man, on Castletown Bay, 11 miles southwest of Douglas. Castle Rushen, now a prison, occupies the site of a Danish fortress of the 10th century, which was almost wholly demolished by Robert Bruce in 1313. The grounds of Rushen Abbey (11th century), near the station, are now market gardens. Near by is the small building where the House of Keys assembled for about 170 years. Brewing, tanning, and lime-burning are carried on. Near Castletown is King William's College, an Elizabethan pile, rebuilt after the fire of 1844.

Cas'tor and Pollux (the latter called by the Greeks Polydeuces), the sons of Tyndareus, king of Lacedæmon and Leda, or, according to some, of Zeus and Leda. The fable runs that Leda brought forth two eggs, one of which contained Pollux and Helen, the other Castor and Clytemnestra. Pollux and Helen, being the offspring of Zeus, were immortal; but Castor and Clytemnestra were begotten by Tyndareus, and mortal. Homer's account is that both Castor and Pollux were the sons of Tyndareus, and that Helen was the daughter of Zeus. The two brothers were inseparable companions, equally brave and spirited, and attached to each other with the fondest affection. Castor was particularly skilled in the art of breaking horses, and Pollux in boxing and wrestling. They were among the heroes of the Argonautic expedition, in which they acquired divine honors; for a terrible tempest having arisen on the voyage, and all with loud voices calling on the gods to save them, there suddenly appeared over the heads of Castor and Pollux two star-like meteors, and the tempest subsided. From this time they were the patron deities of mariners,

CASTOR — CASTRAMETATION

and received the name of Dioscuri ("sons of Zeus"); and from them the name of Castor and Pollux was given to the fires that are often seen on the masts of vessels in storms, and which are electrical phenomena. After their return they released their sister Helen from the confinement in which Theseus had for some time held her. They were also among the heroes of the Calydonian hunt. They wooed the daughters of Leucippus, Phœbe and Hilaeira or Elacira, and carried them off and married them. Having become involved in a quarrel with Idas and Lynceus, the sons of Aphareus, Castor killed Lynceus, and was slain by Idas. Pollux revenged his brother's death by killing Idas, but full of grief for the loss of Castor, he besought Zeus either to take away his life or grant that his brother might share his immortality. Zeus listened to his request, and Pollux and his brother alternately resided one day on earth and the other in the heavenly abodes of the gods. It is doubtful whether the ancients understood them as being together or separate in their alternate passage between the upper and the lower worlds. The former opinion seems to be the oldest; the latter to have gained ground subsequently. Temples and altars were consecrated to them. In great perils, especially in battles, the ancients believed that they frequently appeared to mortals as two youths on white steeds, in shining garments, with meteors over their heads; and then they were chiefly called Dioscuri. They were also represented side by side, either riding or standing, each holding a horse by the rein, with spears in their hands and stars on their heads. In the heavens the Dioscuri appear as one of the 12 constellations of the zodiac, with the name of Gemini (the Twins).

Castor, or **Castor'eum**, an odorous substance obtained from two glandular sacs connected with the sexual organs in both sexes of the beaver. In past years it was utilized for medical purposes, especially as a remedy in diseases of the uterus, and in the case of catalepsy, hysteria, and other spasmodic diseases. What little now reaches market is used as an ingredient of perfumes, but most of it is kept by northern trappers as a scent for baiting their traps, and is known as barkstone.

Castor Oil (*Oleum ricini*), the fixed oil expressed from the seeds of *Ricinus communis*, of the family *Euphorbiaceæ*. The oil is obtained from the seeds by various processes. The seeds are sometimes boiled and the oil skimmed from the water, or the oil may be taken up by solvents, such as alcohol, ether, etc. In the large manufacturing pharmacy houses in the United States the seeds are first warmed slightly and then passed between rollers, or other forms of pressure apparatus. The oil is collected and decanted, or mixed with boiling water and purified. The average yield of high-grade oil is from 40 to 50 per cent in weight. Care must be exercised in the amount of heating of the seeds, else a very active and acrid toxalbumin, ricin, which is present in the seed coat, is added to the oil. This tends to render the oil very griping in its action. Unscrupulous manufacturers have been known to add small quantities of ricin to adulterated oil. Seconds, or sorts, are inferior qualities of oil.

When fresh and pure castor oil should be a clear, colorless, viscid oil, with a faint, mild

odor, a bland and unpleasant taste. Its specific gravity should be .950-970 at 60° F. It should be soluble in equal parts of alcohol; in all proportions of absolute alcohol, or in glacial acetic acid, and tested to exclude other mixed oils, is soluble at 60° F. in three times its volume of a mixture of 19 parts of alcohol and one part of water. This test will detect an admixture of over five per cent of other oils. Castor oil congeals at -18° F. The chemical structure shows castor oil to be composed almost entirely of ricinoleic acid. This is broken up in the intestines by saponification, and sets free the active agent of the drug's action. Castor oil is a reliable cathartic. It empties the bowel completely, largely by its stimulating intestinal peristalsis, and is probably the best cathartic for children with overloaded intestines. In intestinal fermentation and putrefaction accompanied by diarrhoea, it is excellent. It causes a number of loose, not very watery movements, attended with mild griping. There is a tendency to constipation following its use; hence, it is not of service in habitual constipation. As it is extremely disagreeable for many, its taste may be disguised by orange peel, or best in some aromatic frothy or carbonated mixture, as in coffee, soda water, or sarsaparilla soda water. From a teaspoonful to a tablespoonful is the usual dose.

Castor-oil Plant, **Castor-bean**, or **Palma Christi**, a tropical herb (*Ricinus communis*) of the natural order *Euphorbiaceæ*, a native of Africa and Asia, whence it has become distributed in warm countries throughout the world. In cool climates it is a half-hardy annual, but in frostless regions it is a perennial, often becoming a small tree. Its large palmate leaves, sometimes more than two feet in diameter, and its green or red stems, which in the central United States may attain a height of 12 feet, and in the tropics 30 or 40 feet, are very striking in flower borders and clumps of shrubbery. The unisexual flowers are borne in terminal racemes, and the female ones are succeeded by three-celled spiny capsules which explode when the seed is ripe, throwing the seed to a considerable distance. The seeds have long been employed for making castor oil, which is used for lubricating, for making sticky fly-paper, and in medicine. About half the demand of the American market is met by the crops grown in Kansas, Missouri, Oklahoma, and adjacent territory, but since the introduction of petroleum products the oil has a smaller use as a lubricant than formerly, and since the importation of various palm oils its use in soap-making has declined. It is also less popular as a medicine than it used to be. The crop is not considered a paying one. Castor-oil pomace (the oil cake after the oil has been extracted) is a highly valuable nitrogenous fertilizer.

Castoroidæ. See **BEAVER**.

Castoroides, a gigantic, extinct, beaver-like rodent of the Pleistocene epoch in North America. It was as large as a black bear, and inhabited the cold, swampy, evergreen forests of the north, its remains being found chiefly in peat-bogs along with bones of the mastodon.

Castrameta'tion, the art of tracing out and disposing to advantage the several parts of a camp on the ground. See **CAMP**.

CASTRATION — CASTRES

Castration, the removal of the testicles or ovaries of animals. Castration is usually performed to limit reproduction, to change the character of the working animal, making him more docile and easier to train, or to improve the quality of meat for eating, as in capons. In human beings castration is a surgical procedure and is usually performed for the relief of some irremediable or malignant disease. Thus in tuberculosis and cancer of the testicles, and in malignant or painful disease of the ovaries, the operation is justifiable. There has been a large amount of needless removal of the ovaries in women. The after results are often more annoying than the original disease.

The change produced in men by emasculation is highly remarkable, and assimilates their constitution in some respects to that of females. The elasticity of the fibres and muscles is weakened, and the cellular membrane becomes charged with a much larger quantity of fat; the growth of the beard is prevented; the upper part of the windpipe contracts considerably, and the castrate acquires the physiognomy and voice of a female. On the moral character it likewise appears to have some influence by weakening the intellectual faculties and rendering the subject unfeeling, morose, faint-hearted, and on the whole incapable of performing those deeds which require a high, magnanimous disposition. The most numerous class of castrates are those who are made such by the removal of the testicles. Another class are not deprived of the parts of generation, but have them ingeniously injured in such a manner as to leave them the faculty of copulating, but deprive them of the power of begetting. Juvenal mentions these as the particular favorites of the licentious Roman ladies. To the third class belong those who are entirely deprived of their genital members. They are used in preference, by the Turks, as keepers of their women. The castrates of all three classes are called eunuchs. Those of the third class, to distinguish them from the two others, are frequently termed entire eunuchs. The word eunuch is Greek, and signifies "guard" or "keeper of the bed." The castration of adults produces some change in the disposition, but little in the bodily constitution. Even the power of engendering continues for a short time. According to the accounts of ancient historians, the Lydians, celebrated for effeminacy, castrated women. The latter are said to have used these beings as guards of their wives and daughters. With females the operation produces a completely opposite effect to that which it has on men. The sexual appetite ceases, a beard appears on the chin and upper lip, the breasts vanish, the voice becomes harsh, etc. Boerhaave and Pott relate modern instances of this kind. Among the evils which religious fanaticism has at all times produced, castration is conspicuous. The emperors Constantine and Justinian were obliged to use their utmost power to oppose this religious frenzy, and could put a stop to it only by punishing it like murder. The Valerians, a religious sect whose minds had been distracted by the example of Origen, not only considered this mutilation of themselves a duty which religion imposed on them, but believed themselves bound to perform the same, by fair means or foul, on all those who came into their power. In Italy the castration of boys, in order to form them for

soprano singers, was in use for a long time. Clement XIV. prohibited this abuse, which, notwithstanding, did not cease till comparatively recent times, and in some Italian towns was not only suffered but exercised with such shameful openness that the practitioners gave public notice of their profession. In modern times severe laws were enacted against castration, and the custom is probably now extinct. Beings thus mutilated were common on the European stage. It is remarkable that so odious and unnatural an operation should produce the fine effect on the tones of the singer, which all had to acknowledge notwithstanding the disagreeable effect of the association.

Castrén, kās-trän', **Matthias Alexander**, Finnish philologist: b. Tervola 2 Dec. 1813; d. Helsingfors 7 May 1852. While attending, as a young man, the University of Helsingfors he conceived the project of tracing out the various detached branches of the Finnish races and languages, and presenting their ethnological and philological phenomena in one general view. Following out this idea he undertook in 1838 a pedestrian excursion through Finnish Lapland, and another in 1840 through the district of Karelia, with the view of studying the primitive language of that country, and enabling himself to translate therefrom into Swedish the great Finnish epic of the 'Kalevala.' This last work was accomplished by him after his return. He soon, however, resumed his travels, and for several years continued to prosecute his researches among the nations of the Arctic regions, both in Europe and Asia, including the Norwegian and Russian Lapps, and the Samoyeds of Siberia and the coasts of the White Sea. Naturally of a weakly constitution, and in a failing state of health, he was frequently obliged in addition to submit in the course of his journeys to the most extreme privations. Having returned home from his last journey to the Samoyeds, he was appointed in 1851 professor of the Finnish and old Scandinavian languages in the University of Helsingfors, but died before he had been able to add much more to his work—a martyr to the cause of science. Among his writings are: his translation of the 'Kalevala'; 'Elementa Grammatices Syriacæ'; 'Elementa Grammatices Tscheremissæ'; and 'De Affixis Personalibus Linguarum Altaicarum'; besides travels and other works published after his death.

Castres, kâstr, France, a town (ancient **CASTRUM ALBIENSUM**) in the department of Tarn, 23 miles south-southeast of Albi, on the Agout, which divides it into two parts—Castres Proper, north side, and Villegoudon, south side of the river. The public buildings include the hôtel de ville, formerly the episcopal palace, which contains a public library, and has a garden laid out on the plan of the Tuileries; three churches, one of them Protestant; two hospitals, a theatre, cavalry barracks, etc. The manufactures consist of fine cloths, coarse cloth for the troops, flannels, blankets, and other woolen goods, linen, glue, and black soap. There are also bleaching-grounds, dyeworks, tanneries, paper-mills, forges, and brass-foundries. Trade is also carried in in silk, cotton, liqueurs, and confectionery. Castres has a communal college and two seminaries. The town arose round an abbey of the Benedictines (which is said to have

CASTRIES — CASTRO

been founded in the 9th century), and was already in the 12th century a place of importance. During the religious wars of the 16th century Castres was the scene of many conflicts. Louis XIII., to whom the town surrendered in 1629, ordered its fortifications to be razed to the ground. Pop. about 20,000.

Castries, Charles Eugène Gabriel de la Croix, sharl e-zhân ga-brê-êl de la krwa kast-rê, MARQUIS OF, French soldier. b. 1727; d. 1801. He entered the army, fought at Dettingen and in lower Alsace, became lieutenant of Languedoc and governor of Montpellier and Cette, and under Marshal Saxe commanded the army in Flanders, where he covered the sieges of Mennin, Ypres, and Courtray, and ended the campaign with the battle of Courtray. He afterward fought at Fontenoy, Raucoux, and Lanfeld. During the Seven Years' war he added greatly to his fame, was made lieutenant-general, and was dangerously wounded in the battle of Rossbach. In 1783 he was marshal of France, and emigrating in 1791 found an asylum with the Duke of Brunswick. He subsequently commanded the army of the French princes in Champagne, and countersigned the manifesto issued by Monsieur in 1793. In 1797 he formed, in conjunction with St. Priest, the so-called cabinet of Louis XVIII. at Blankenburg.

Castriota, kàs-trê-ô'tâ, George. See SCANDERBEG.

Castro, kas'trô, Augustin, Mexican poet: b. Cordova, Vera Cruz, 24 Jan. 1728; d. Bologna, Italy, 1790. He became a Jesuit priest and a teacher of philosophy, and was a skilful translator of classical authors. Among his original works in poetry are: 'Hernán Cortez' and 'Charts,' a guide for young poetic genius. His versions of Sappho, Euripides, Horace, Seneca, Milton, and Fénelon have received high praise from scholars.

Castro, Cipriano, Venezuelan military leader: b. Capachio, Venezuela, near the frontier of Colombia, about 1855. His parents were Spanish mestizos of the peasant class. He attended school in Capachio. While still a very young man he took an active part in politics in Capachio, as a Liberal. His first military exploit consisted in scoring a moderate success in the so-called "Battle of Capachio" (1886) against Morales, the local representative of the Lopez government. He remained a leader of the Liberal party in his state until 1892. In that year began Crespo's rebellion against Andueza. Castro, supporting Andueza's cause, was victorious in the battle of 15 May 1892, in Táriba; defeating Morales who now was under Crespo's command. In Caracas, however, the insurgents triumphed. Crespo entered the capital 6 Oct. 1892. Castro remained in control of Táchira and Merida, but before the end of the year withdrew across the Colombian frontier and bought a farm near Cúcuta in the department of Santander. For the next six or seven years he was a farmer and cattle-raiser. Invited by Crespo to take office as head of the customhouse at Puerto Cabello, he declined this offer, but promised Crespo not to join his enemies or attack his government. Andrade was Crespo's successor. Castro went to Caracas and called on the new president. Accounts of this visit differ. Castro's partisans assert that he

again refused the tender of an office under the government; according to another version he was insulted, and left the Yellow House vowing vengeance. When he returned to his home some political friends and relations of Andrade's who lived in Cúcuta procured for the Colombian government an order for his arrest. For about two months he was in hiding; then he invaded Venezuela with only 60 men (23 May 1899). His old followers in Táchira joining him, in three days he collected a force of 1,500. The first skirmish was in the country between San Cristóbal and Rubio. In Las Pálas the commander of the government's frontier troops fell. At Zumbador about 2,000 men led by Morales were defeated. Castro laid siege to San Cristóbal, where Peñalosa was strongly entrenched. About 6,000 men under Fernandez were sent against him from Caracas. An indecisive engagement occurred. Then Castro left Fernandez in the rear, and marched toward the capital, defeating several government forces on the way. Andrade having fled the country, Castro entered the capital, opened the prison in which Hernandez had been confined for many months, and declared himself "jefe supremo"—neither president nor dictator, but "supreme military leader." The constituent assembly made him provisional president of Venezuela, 30 March 1901, and on 20 February 1902 he was elected president for the term of six years. But his duty has continued to be that of a military leader. Hernandez promptly revolted, and was put back into prison. Celestino Peraza was the next rebel; and after Peraza came Matos, who intrigued to gain the support of foreign governments. See VENEZUELA.

Castro, Guillen de, Spanish dramatist: b. Valencia 1569; d. Madrid 28 July 1631. He was at one time commander of a Neapolitan fortress. In his later years he lived in Madrid, and was on intimate terms with Lope de Vega. Castro's memory has been chiefly preserved by his authorship of 'Las Mocedades del Cid,' to the first part of which Corneille was indebted for the plot and many of the beauties of his celebrated tragedy. The other plays of Castro are badly constructed, and chiefly distinguished for their intensely national spirit.

Castro, Ines de, ê nês dã, Spanish lady: d. 1355. She was descended from the royal line of Castile. After the death of Constantia, wife of Pedro, son of Alfonso IV., king of Portugal, in 1345, Ines was secretly married by Pedro, whose mistress she had already been. As he steadily rejected all propositions for a new marriage, his secret was suspected, and the envious rivals of Ines were fearful that her brothers and family would gain a complete ascendancy over the future king. At length Alfonso resolved to put Ines to death. The first time that Pedro left Ines, the king hastened to Coimbra, where she was living in the convent of St. Clara with her children. The arrival of Alfonso filled the unhappy lady with terror. She threw herself with her children at the king's feet, and begged for mercy. Alfonso was softened, but afterward gave his counselors permission to commit the murder, and it was executed that very hour. Ines expired under the daggers of her enemies. She was buried in the convent where she was murdered. Pedro took arms against his father, but soon became reconciled to him.

CASTRO — CASUISTRY

Two years later Alfonso died; the assassins had already left the kingdom and taken refuge with Pedro the Cruel of Castile. An exchange of fugitives was carried out. Of the three murderers of Ines, one escaped, but the other two were tortured in the presence of the young king Pedro at Santarem in 1360. Their hearts were torn out, their bodies burned, and their ashes scattered to the winds. Two years later, it is said, King Pedro at Cataneda declared on oath that after the death of Constantia he had obtained the consent of the Pope to his union with Ines, and had married her. The archbishop and Lobato confirmed the assertions of the king; and the Papal document to which the king referred was publicly exhibited. The king caused the body of Ines to be disinterred, and placed on a throne, adorned with the diadem and royal robes, and required all the nobility of the kingdom to approach and kiss the hem of her garment, rendering her when dead that homage which she had not received in her life. The body was interred at Alcobaça, where a splendid monument of white marble was erected, on which was placed her statue, with a royal crown on her head. The history of the unhappy Ines has furnished many poets of different nations with materials for tragedies, and the Portuguese muse has immortalized her through the lips of Camoens, in whose celebrated 'Lusiad' the history of her love is one of the finest episodes.

Castro, Joao de, zhō-owh' dā, Portuguese navigator: b. Lisbon 7 Feb. 1500; d. 6 June 1548. In 1538 he accompanied the viceroy Garcia de Neronha, his uncle, to India, as commander of a vessel, and in 1540 was in the expedition that explored the Red Sea, of which he made charts and scientific descriptions. His profound knowledge of mathematics and languages made these works of great value. They were published under the title of 'The Log-book of Don John de Castro, on the Voyage which the Portuguese made to the Red Sea.' After his return he was made commander of a fleet to rid the European seas of pirates; was appointed governor of India in 1545, in which office he defeated the great army of the Moors, under Adhel Khan, and completely subjugated Malacca. In 1547 he was commissioned viceroy of India, but died shortly afterward.

Castro, Jose Maria, hō-sā' mā rē'ā, Costa Rican statesman: b. San Jose 1 Sept. 1818. He was educated at the University of Leon, Nicaragua, and held positions under the government of Costa Rica. In 1846 he was vice-president and in 1847 was elected president. After Costa Rica withdrew from the Central American states, he resigned the presidency, but held diplomatic positions. From 1866 to the rise of the Jimenez government (1868) he was again president.

Castro Urdiales, a seaport town of Spain, on the Bay of Biscay, in the province of Santander. It was sacked by the French in 1811, but has since been neatly rebuilt. A ruined convent of the templars is in the vicinity. It has a safe harbor, and extensive fisheries. Pop. (1900) about 13,000.

Castro-Del-Rio, a town in Spain, Andalusia, 16 miles southeast of Cordova, on a slope above the Guadajoz. The more ancient portion is surrounded by a dilapidated wall, flanked

with towers, and entered by one gate, which was defended by an Arab castle, now also ruinous. The modern portion is outside the walls, and extends along the foot of the hill on its north side. The most of the streets are wide and regular, lined with well-built houses and handsome public edifices. The church is large and handsome, and there are also several convents, two colleges, primary schools, hospitals, and manufactures of linen, woolen, and earthenware. Pop. (1887) 11,290.

Castrogiovanni, or Castro Giovanni (anc. ENNA), a city of Sicily, in the district of Caltanissetta, on a plateau in the centre of the island, 4,000 feet above the sea. The climate is healthy, the soil fertile, and water abundant. The old feudal fortress of Enna is the chief edifice. It contains also a cathedral. It was the fabled birthplace of Ceres, and the site of her most famous temple. About five miles distant is the lake of Pergusa, where Proserpine, according to the poets, was carried off by Pluto. During the first servile war the insurgent slaves made Enna their headquarters. It was captured by the Saracens in the 9th and by the Normans in the 11th century. Pop. 19,800.

Cas'trum Dolor'is, a Latin term signifying castle of grief, has a different meaning from *catafalco*. The latter is used to denote an elevated tomb, containing the coffin of a distinguished person, together with the tapers around, ornaments, armorial bearings, inscriptions, etc., placed in the midst of a church or hall. The *castrum doloris* is the whole room in which the *catafalco* is elevated, with all the decorations. The sarcophagus, usually empty, is exposed for show upon an elevation covered with black cloth, under a canopy surrounded with candelabra. Upon the coffin is laid some mark of the rank of the deceased, as his epaulette or sword, and, when the deceased was a sovereign or a member of a ruling family, princely insignia are placed on surrounding seats. The French call the *castrum doloris*, *chapelle ardente*, sometimes also *chambre ardente*; but the latter has also a separate meaning.

Castuera, kās-too-ā-rā, Spain, a town in the province of Badajoz, near the right bank of the Guadalefra. Most of its streets are straight, clean, and well paved. It has two squares, lined with substantial houses; the principal one contains the town-hall, prisons, and spacious modern parish church. The inhabitants are engaged in weaving, making earthenware, tiles, bricks, shoes. Trade is carried on in cattle, wool, wine, grain, and oil. Pop. 7,133.

Casualty Insurance. See INSURANCE, CASUALTY.

Casuarina, kās-ū-ā-rī'na, or **Botany-bay Oak**, the single genus of the natural order of *Casuarinaceae*, or cassowary-trees. There are about 30 species, natives chiefly of Australia. They are jointed leafless trees or shrubs, nearly related to the birches, having their male one-stamened flowers in whorled catkins, and their fruits in indurated cones. Some of them produce timber called beefwood, from its color. *C. quadrivalvis* is called the she-oak, *C. equisetifolia*, the swamp-oak.

Cas'uistry, the science or art of determining cases of conscience and the moral character of human acts; so called from *casus conscien-*

CASUS BELLI—CAT

tia, a case of conscience. Wherever the question rises, Is such an act allowable by moral law? there is a case of conscience and matter of casuistry, and in deciding the question for himself, as everyone habitually does, everyone is a casuist. But in current usage a casuist is one who, skilled in the prescriptions of the divine moral law and its interpretation whether by lawgivers, moralists, or theologians, studies either suppositions or actual cases of conscience and judges whether a given act, or even a given thought is consistent with or in violation of moral law—for, unlike the civil lawgiver or the ministers of civil law, the casuist must determine the moral character of thoughts no less, or rather more, than of acts. The professional casuist is inevitable in the system of the Catholic Church, where the minister of religion, in his capacity of *confessarius* or confessor must be the counselor and director of penitents and resolve for them questions of guilt or innocence, questions touching the obligation to restitution, for example of goods, or reparation of damage to a neighbor's reputation by slander; granting or withholding absolution according to the merits. For the minister of the sacrament of penance acts under Jesus Christ's commission, whose sins ye shall forgive, whose sins ye shall retain, shall be forgiven or retained; and to execute that commission the minister of the sacrament must decide for himself and the penitent the moral character of the acts. The science or art of casuistry has doubtless been carried to extraordinary lengths; but though the questions which it treats are such as touch individually and most intimately daily and hourly the many millions of souls who resort to the confessional, the works of writers on casuistry, though voluminous, would count as a scant armful compared with only one part of the works contained in a law library—those which record the decisions of the civil courts. It is true also and inevitable that casuistry like law lore is often employed as a means of escaping from legal penalty or of quieting the sense of guilt. As there are lawyers who for a fee will defend any cause however defenseless morally, even to the extent of working injustice—loss of property, loss of reputation to the party opposite—so there are casuists who by their overinclining to an indulgent interpretation of the divine moral law, release or cut the nerve of moral responsibility, administer an opiate to conscience.

Probabilism is the name given to the doctrine which declares to be lawful *in foro conscientia* an act the moral correctness of which is affirmed by any moral theologian of weight (*doctor gravis*); or, as defined by Liguori, a probable opinion is one which rests on a solid foundation (*fundamento gravi*) both of reason and of authority, so that it is able to move the assent (*flectere assensum*) of a prudent man, though with fear regarding the opposite. But a writer in a great encyclopædia, who regards probabilism as "the most remarkable doctrine they (the casuists) promulgated—a doctrine which it is hard to believe that any one ever ventured to assert" teaches that "according to probabilism" "any opinion which has been expressed by a 'grave doctor' may be looked upon as possessing a fair amount of probability, and may, therefore, be safely followed, even

though one's conscience may insist upon the opposite course": the last clause is gratuitous and has no warrant in the teachings of Catholic moralists, who unanimously hold that an act done in defiance of conscience, even be it a plainly erroneous conscience, is a sin.

Viewed in the abstract, the rule of the probabilists is not an unreasonable one: it is acted upon daily by whoever, doubting his own judgment, asks counsel of others whom he regards as trustworthy advisers, even though they be not grave doctors (*graves doctores*). It is admitted that some of the probabilists, even the greatest of them, as Escobar, Suarez, Busembaum, did not always guard the doctrine against misconstruction, and gave occasion for views of moral obligation which were too lax: but the ecclesiastical censure has fallen upon such erroneous teachings, without discrediting for Catholic moralists the principle of probabilism. Let any other school of moral teaching set to itself the same task which confronts the moral theologian of the Catholic Church, that is, to define with precision the moral character of every act, every thought, every imagination that has relation to the moral law, and it will be seen whether probabilism must not have a place in its system.

Cas'us Bel'li, the material grounds which justify (or are alleged by one of the parties concerned to justify) a declaration of war (*qv*). The *casus belli* is not seldom a very trifling one, and does not necessarily indicate the real *causa belli* or cause of the war.

Cas'well, Richard, American lawyer: b. Maryland 3 Aug. 1729; d. 20 Nov. 1789. He removed to North Carolina in 1746; was president of the Provincial Congress which framed the State Constitution (1776), and first governor of the State, three times re-elected; was also a delegate to the convention which framed the Federal Constitution in 1787.

Cat (*Felis domesticus*), a well-known domesticated quadruped of the order *Carnivora*, the same name being also given to allied forms of the same order. Some have thought that the domestic breed owed its origin to the wild cat; but there are considerable differences between them, the latter being larger, and having a shorter and thicker tail, which also does not taper. The domestic cat belongs to a genus—that which contains the lion and tiger—better armed for the destruction of animal life than any other quadrupeds. Its short and powerful jaws, trenchant teeth, cunning disposition, combined with nocturnal habits (for which its eyesight is naturally adapted) and much patience in pursuit, give it great advantages over its prey. It is characterized by six incisor teeth above and below; two canine teeth in each jaw, powerful and formed for tearing; molar or cheek teeth, four in the upper jaw and three in the lower, thin, pointed, and wedge-shaped, formed for cutting. The head is large, round, and wide; the eyes have the pupil often oblong; the tongue has strong horny papillæ, directed backward. The feet are formed for walking; the toes are five in number on the fore feet, and four on the hind feet, armed with strong, sharp, and hooked claws, retracted when the animal walks. The intestines are very short, as in all animals living almost exclusively on animal food. The cat in a degree partakes of all the attributes of its race. Its food in

CAT, DOMESTIC

a state of domestication is necessarily very various, but always of flesh or fish if it can be obtained. Instances of its catching the latter are known, though usually the cat is extremely averse to wetting itself. It is a very cleanly animal, avoiding any sort of filth, and preserving its fur in a very neat condition. Its fur is easily injured by water on account of the want of oil in it, and it can be rendered highly electric by friction. The cat goes with young for 63 days, and brings forth usually from three to six at a litter, which remain blind for nine days. It is usually regarded as less intelligent than the dog, but this is by no means certain. It has a singular power of finding its way home when taken to a distance and covered up by the way. The wild cat (*Felis catus*) is still found in various parts of Europe and western Asia, chiefly in forest regions, making its lair in hollow trees or clefts of rocks. It is a very fierce animal. There are a number of other animals, of similar size and habits, known as cats, such as the fishing-cat (*F. viverrina*) of Bengal and eastern Asia, the leopard cat (*F. bengalensis*) of northern India and southeastern Asia, the marbled cat (*F. marmorata*) of the same region, the rusty-spotted cat (*F. robiginosa*), a small Indian species, etc. For varieties of the domestic cat see CAT IN AMERICA.

Cat, Domestic, The. There is little doubt that the influence of the domestic cat upon American civilization has received less consideration than it deserves, for a great deal of the advance in agriculture, as well as of the spreading out over the vast woodlands and prairies of America, has been made possible by this much abused and misunderstood animal. For places suddenly thrown open to settlement the cat is often one of the first things sought, is one of the first of the necessary household gods, and goes in with the cooking-stove and the dish-pan. The reason for this is, that on our great prairies mice are found in countless thousands. The settler, not being near a town, buys his goods by the wagon-load, and, being able to go to the base of supplies only once or twice a year, stores his food in barrels and sacks, enough, perhaps, for six months ahead. This opportunity is not lost by the mice, which, swarming indoors out of the prairie grass, find ideal conditions; abundance of food, warmth, shelter, and comfort. If the simple eating of the food ended the trouble, it would not be so bad, but field-mice, imbued as they are with the instinct of storing everything, have a knack of mixing different things together—the rice with the coffee, sugar with both, etc., until there is a *potpourri* that no one can separate, and cooking is made impossible.

After such happening the settler speedily seeks a cat, and the prices paid would astonish those who think cats merely a nuisance. How much food cats have saved, how much property they have guarded from destruction, what plagues of vermin they have kept in check, from the time this country was first settled, it is impossible to compute. But for their sleepless vigilance the large cities would quickly be overrun with rats and mice. How indispensable their service is may be seen in the condition of farms in the British Isles, rendered useless by rats and mice, because the cat, as well as the

hawk and the owl, is suppressed to make way for the game preserve, to afford the pleasure of shooting for a few weeks, or perhaps, only a few days in the year.

The cat, then, is a necessary adjunct to our civilization, a factor and an institution to dislodge which would imperil our status as a nation; and until a substitute can be found the cat is an economic necessity in our daily life that cannot be done away with without upsetting the balance of nature greatly to our disadvantage. This fact is recognized by the government, which appropriates money every year for the maintenance of cats in the post-offices and other public buildings of the larger cities, in order to keep down the vermin that would gnaw holes in mail-sacks and destroy public records and other property. It is recognized in the national printing-office of France, where vast quantities of paper are stored, and where an army of cats is retained to keep the mice in check. In Vienna it is regarded as a part of good municipal government to take care of the cats. The United States government has systematized its cat service in public institutions, and in Pittsburgh a certain strain has been bred to live in cold-storage houses, and is developing characteristics peculiar to this kind of life. In warehouses, corn-cribs, barns, mills, and wherever grain or food is stored, cats must be kept.

Having shown, to a limited extent, the necessity of keeping cats, we will now turn to the advance made in their care and selection; for the arousing of interest which has come from the scientific breeding of cats for exhibition purposes is destined to lift the family to its proper place in public economy, where the breeding and keeping of them can be properly regulated, their health cared for, the diseased put out of the way, and the family, as a whole, elevated to the position to which its beauty and usefulness entitle it. To be effective, they must be taken care of, for well-fed cats are the best mousers.

The origin of the domestic cat is shrouded in mystery, and to the Egyptians we have to turn for such of its early history as is reliable. The Egyptians being an agricultural people, and the raising of wheat their main industry, they quickly grasped the fact of the usefulness of the cat; and the earliest ones were probably obtained by taming kittens of the native species (*Felis caligata*), and to these we most likely owe the greater part of our short-haired cats. Possibly when the Aryans made their pilgrimage from Asia they brought specimens of the short-haired, domestic cats from India, for there are, at the present day in India, domestic cats that are not likely to have any Egyptian blood in their veins. Whatever the origin of the domestic cat, it is probable that in comparison to the date of the domestication of the horse, dog, ox, etc., the advent of the cat to our firesides is comparatively recent. Though cats appear on tombs, or as illustrations, as far back as 1600 B.C., this date may be said to be comparatively recent if we consider the question in relation to the probable date of the domestication of the dog. The Egyptians loved their cats, understood their usefulness, and ended by worshipping them as sacred animals, and giving them a careful burial, for the mummies of cats, beautifully wrapped in expensive fabrics, are constantly coming to light when excavations

EUROPEAN WILD CAT (*Felis catus*).

CAT, DOMESTIC

are made in and around some of the buried cities of Egypt. The Greeks and Romans, about whom we have a clearer knowledge, and whose times seem to come nearer our own, appear not to have paid much attention to cats, and they have left us nothing in their literature, inscriptions, or paintings that leads us to any knowledge of the history of the domestic cat. There seems to be no record that the cat became domesticated in France or in England before the 9th century, but at that time it was considered of great value and was a regular object of trade.

American interest in the cat is often said to have originated within the last eight years, that is, since the advent of exhibitions and the taking up of the cat cult by the public. This impression is not borne out by facts, for we have exhibitors who have intimately studied cats, have bred and raised them, and have cared for them for over 50 years, and cat-shows were held in Maine between 1860 and 1870, even before the great exhibition instituted in London by the well-known animal painter, Harrison Weir, in the year 1871. But cat-shows in America were not known outside of Maine until one was held in the Madison Square Garden, New York, in 1895. The exhibitions in England have gone on from Mr. Weir's first show up to the present time, so that the marking epochs in modern cat history may be dated from the Crystal Palace show in 1871, and the New York show in April 1895. From these shows has arisen what may be described as a cult, or in some ways an industry. Numbers of individuals, principally women, have taken up the cat as a partial means of livelihood, selling those they rear by exhibiting them to the public, the outcome of which has been the production of different colors, strains, and families. Clubs have arisen for the care and maintenance of exhibitions; registers and stud-books have been started; and the importation of rare varieties or valuable specimens is duly recognized by our government as one of the many things to be considered and provided for in a tariff schedule.

The varieties or breeds recognized in shows are the Persian, Siamese, Abyssinian, and ordinary domestic short-haired cats. The Persian and Angora may be said to be the same cat, though distinctions were drawn in old days; but these were very indefinite, and at the present time we draw up rules and regulations for two large groups, the Long-haired Cats and the Short-haired Cats, and these are judged by points and classified by color distinctions. Angora is a small place, and comparatively few cats could have come from there, but many have come from other parts of Asia. Taking the long-haired division first, because commercially it is the most prominent, the judge requires that the cat shall be short in body with a short tail and short legs, the latter shorter in front than behind. The chest should be wide, the loin square and firm, the bones of the legs well developed, and the frame sturdy. The head that corresponds with this formation and is required, is a broad, round head with short, wide nose, eyes large and round, and set well apart. The ears, a most important feature, should be as small as possible and placed on the side of the head, the base of the ear being narrow, not gaping wide open, with a tuft of hair at the apex. This standard is more or

less based upon original imported specimens from Asia; and if studied it will be found that the probable ancestor of our domestic long-hairs, *Felis manul*, or the wild long-haired cat of the interior of Asia, is built on these lines. The colors most valuable and most approved are the light silvers, smokes, blues (or slate color) white, black, orange, cream, and tortoise-shells; and the tabbies of different colors are also favorites. The tabby-cat is a cat that has a light ground-color and is spotted, barred or striped with darker color, and the word "tabby" has no reference to the sex of the animal. The name "tabbie" is derived from Atab, a street in Bagdad celebrated for its manufacture of watered or moiré silks, which in England were called *atabi* or "taffety." The most usual colors in tabby-cats are yellow, marked with orange or red, making what are called orange tabbies; yellow brown, marked with black, making the brown tabbies; gray, marked with darker stripes, giving us the gray tabbies; and pale silver, marked with black or a sort of dark blue verging on black, from which we have the silver tabbies. The great feature required in tabby-cats is that the ground-color should afford as distinct a contrast to the stripes, bars, or spots, as possible; the colors should be vivid and the marks very plain. There are spotted tabbies, and in these the spots must be round, clear, and distinct; but we seldom see a good one of this variety unless it came from India, the home of the best spotted tabbies. The solid-colored cats are the whites, blues, blacks, and smokes; although recently the silvers, creams, and oranges have in a few instances almost attained perfection in being without marks or foreign color. The tortoise-shell cats are black, red, and yellow; when accompanied by white, the patches are more clear and distinct, and this feature is what is aimed at. Tortoise-shell males are almost unknown, and orange females are very scarce.

The eyes of a cat are an important feature, and should be large, round, and pleasant in expression. Although color of eye is a great feature, many judges prefer large, well-placed, pleasant eyes to those that are more correct in color but badly placed, or are small and mean in expression, or give the cat a sour look. The color of eyes required may be briefly summed up as blue (as deep as possible) for a white cat; emerald-green for light silver, or chinchillas, as they have been called; and yellow to orange, as deep as possible, for all other varieties. The color and beauty of the cat's eyes vary according to the state of health, the light, and the time of day, and judges have to be careful in this matter. The body-colors can be defined as white, as pure as possible; black, deep and glossy; blue or slate, sound and pure from root to tip of hair, showing no light shadings or light under-color; smoke, a deep plum-color, silver undercoat; ruff, and stomach; cream, light fawn or cream color; orange, whether marked or unmarked, should be as rich and strong as possible. The tortoise-shells marked with clear distinct patches, clean-cut and free from each other. The fur of the long-haired cats should be fine, long, silky, and glossy; wooliness is deprecated, but is more inclined to appear in certain colors, such as orange and cream; and blacks may have a rather coarser texture of coat if they make it up in

CAT, DOMESTIC

color. But in whites, silvers, blues, smokes, and in brown tabbies there can be no excuse found for anything but exquisite quality.

In the short-haired division we must consider our old fireside friend first, and coloration in this variety is much the same as in the long-hairs, though we do not often find smokes or so many silvers, and the blue-eyed whites have probably been bred from the long-haired cats. But as to color, color of eyes, and classification, the rules specified for long-hairs fit the short-hairs except that the tabby-cats are more distinctly marked and more brilliant, as the colors are not clouded or mixed by the length of the hair. White cats with blue eyes are generally deaf, but not always. The short-haired cat is rather different in formation to the long-haired cat, the face is more angular, or rather the nose may come to a finer point, though its cheeks should be well developed. The eyes are differently placed, yet should be full and large, the ears larger, closer together, more toward the top of the head, wider at the base, and more pointed at the apex. The body should be moderately long, slender, and elegant. The great thing to avoid in all cats is coarseness, and size alone is not a recommendation.

The Siamese is a distinct variety which comes from the palace of the king of Siam or from a few families of nobles. These cats are conceded to be the most intelligent and companionable of all cats, but having been much inbred, are not easily reared and do not increase very fast. The climate of California suits the Siamese cat, and the variety is found there in fair numbers and doing well. The points valued in this cat are a rather small and flat head, a small and elegant body of a light fawn or biscuit color, with chocolate-colored legs, mask, and tail. The more decided the contrast—that is, the lighter the body color and the darker the points—the better. The Siamese are much appreciated as show-cats. Chocolate-colored cats of this variety are found and are valuable. The fur most approved is very fine and glossy, resembling beaver. The eyes are blue, the color as rich as possible.

The Manx cat makes a distinct species in our exhibitions, and is classed by itself. Besides the absence of tail, which is the distinguishing feature of this cat, a different formation of body is required; namely, that the fore legs should be short and the rump rise as abruptly as possible, making the hind legs longer than the fore legs, so that the cat seems to jump forward like a rabbit, and is sometimes called a rabbit-cat. The head should be neat, round, and rather small, and the cat itself small, short, and compact. The Manx cat may be of any of the recognized colors. There is a distinction between this variety and our other domestic cats. Gambier Bolton who studied the question, and traveled to collect specimens for the British Zoological Society, coincides with the naturalist Kempfer, and recognizes a strong likeness in these cats to those of the islands in the East, the Malay peninsula, Japan, China, and lands contiguous. All the cats in those parts, even the Siamese, seem to have peculiar formations of the tail, whether cut short, forked, kinked, or otherwise. These cats are smaller; there are differences in the call or language, ways, and character, that have been observed by these

students. The origin of the Manx cat is now attributed to the arrival of these cats on the Isle of Man from ships belonging to the Spanish Armada that were wrecked there. These cats were most probably previously brought from Japan or other parts of eastern Asia, for cats now brought from Japan are exactly like our Manx. A cat with his tail cut off, showing a stump, does not constitute a Manx cat for the student.

Other cats found in show-rooms are the Abyssinians, but they do not make much headway and have not yet arrived in America. The males are generally darker than the females, and the color of these cats should be a deep brown ticked with black, somewhat resembling the back of a wild rabbit, with a distinct black band running down the back to the tip of the tail. The inner sides of the legs and belly are more of an orange tint than the body, and are marked in some cases with a few dark patches. The eyes are deep yellow, tinged with green; nose dark-red, edged with black; ears rather small, dark-brown, with black edges and tips; and the pads of the feet are black. Attempts have been made to copy this cat, and it has been attempted to exhibit, as such, slightly marked ordinary short-haired cats, but they are not the genuine breed. The absence of tabby-markings is the point most sought and prized, and if kept pure the characteristics of these cats are peculiar. The Abyssinian cat has never been very numerous at exhibitions, perhaps because it is a short-haired cat, though short-haired cats, when good exhibition specimens, bring large prices. Cats marked with white have not found much favor in British exhibitions, but have always been popular at American shows, and Madame Ronner, the great French painter of cats, usually depicts her cats—that is, the dark ones—with some white patches. If cats are marked with white, they are preferred with four white paws and a white face; that is, the white starting in a sharp point between the eyes, spreading out onto the lips, making a triangle with the apex on the forehead, and continuing thence down the chest, but not spreading to the shoulders or going round the neck or over the back. Any marking, in an "any other class," that is regular and even, and forms anything like a regular pattern, should be recognized and encouraged by a judge; besides which, any effort made to bring out a new variety or color must be taken note of and encouraged. There is now a tendency to encourage Dutch marked cats, which means black patches on the cheeks, a white blaze up the face, joining a broad, white belt which goes completely round the cat halfway between the ears and tail. Of the cats indigenous to the American continent, which might be suitable for domestication, few have been tried in a domestic way, and the species that inhabit this country are not many. I have seen the wild cat or gray lynx, at shows, behaving in the most exemplary manner. Having been brought up from infancy by children, and perfectly tame, it was more at ease in a large show-room, and not nearly as nervous as the ordinary feline. So that if it were not for the size of the creature, its possibilities as a domestic animal were certainly good; but unfortunately our time does not seem to be destined to take in hand or give us any fresh species of domesticated animal; what we have are handed

CATS.

1. White Persian.
2. Light Silver.
3. Cream Persian.

4. Siamese.
5. Silver Persian.

6. Shaded Silver.

CAT, DOMESTIC

down through the ages. In this particular we are not original, for we destroy more often than we create, and we seem to have no time for trying to subdue or lead into bondage any new varieties of mammals. The puma, cougar, or mountain lion ranges over the whole of North and South America, but is too large for domestic purposes; yet it has never been aggressive against man, and, if history is to be thoroughly credited, was quite the reverse with early settlers till driven to exile and filled with fear by man himself. The ocelot is one of our most beautiful varieties, and varies somewhat in color, with sometimes a gray body-color, but more often yellow. It is clearly marked with dark color in spots, bars, and splotches, and is very handsome, but larger and more powerful than the domestic cat. These cats have been taken when young, and reared; and although comparatively tame and sociable till about a year old, they then become savage and impossible and have to be caged or killed.

A very pretty cat that has been exhibited in America is the margay from Central and South America, where it inhabits the woods. I have handled this cat at a show and found it very tame and with a passion for being caressed. The margay is light red or orange, beautifully and regularly spotted with small black spots, the ears small, round, and pointing forward, whitish-gray at the backs, edged with black. It is a small cat, very handsome and refined, and if the effort could be made to obtain some more of the species these cats would be a very valuable addition to our varieties and to our home circles. Geoffroy's cat is another small spotted cat, of which a few have been introduced into England, but it is too early to state what the future increase may be. The pampas cat is another feline not amenable to domestic life.

As a rule our best white cats with blue eyes come from India and some of the best are brought from Tibet. In crossing the Himalayan Mountains with these cats carriers slit their noses to enable them to breathe with greater ease the rarified atmosphere of the high altitudes. Cats with slit noses are much valued. As to cats coming from this place or that, such as Persia, Angora, etc., a good deal of proof is required before any particular claim can be accepted. I have failed to find any long-haired cats at Teheran, the capital of Persia, and Angora, as I have said, is but a small place. We probably obtained many of our long-haired cats from around the Persian Gulf, and more from India, many of which come down from the interior of Asia with the Arab horse-traders. Cats vary in their adaptability to changes of climate, and no doubt to this factor we owe what we have and what breeds we can retain and perpetuate. The Siamese soon succumbs to dampness, but the long-haired cats, in some cases, took to the climate of Maine early in the century, when brought from the East. They bred extensively, and increased and became an article of commerce to the large cities, long before these cities held shows. These cats went by the name of Angoras, and in fact the ordinary nomenclature of the country defines all long-haired cats as Angoras. The Maine cats were often carelessly bred, and when shows commenced and competition came they had to give way to the more finely bred English cats, but in other cases they held their own and the

blood has been perpetuated. The Maine cats are found in all colors, and some are very big and strong, but these have been probably crossed with short-haired cats, and a great deal of hybridizing has been done even in England. There is a Russian long-haired cat, but it has not gained much favor, being solitary in its habits, unsociable in character, coarse in body and fur, and dingy in color. A few have been brought from Persia, but they had the faculty of attaching themselves more to other cats than to their owners. They are originally the same cat as the Asiatic,—that is, the Persian or Angora; and the first long-haired cats must have been brought over by sailors and travelers from the East. All long-haired cats seem to have a common origin in Pallas' cat (*Felis manul*).

Another cat that has created a great deal of interest is the Maltese. This cat is hard to account for, but should be blue or slate in color and greatly resembles what in Great Britain is called the Russian or Archangel cat, specimens of which have often been brought from Russia; but lately quite an influx of blue cats has come from Iceland. Whether cold winters are calculated to develop blue cats I do not know, but it is sufficiently evident that northern climates have produced most cats of that color. Blue cats are not numerous in Great Britain, although they are becoming more so by introduction. Here in America we have plenty scattered all over the States, but how they gained their name of Maltese I have never been able to discover, for there is no blue cat indigenous to the island of Malta. Probably the cats were brought there in early times from the same source whence the English now obtain theirs, and, the color being peculiar, these cats were selected, or by superior hardiness they may have selected themselves. However, many people who are not cat-exhibitors or who do not know much about cats scientifically keep their short-haired blue "Maltese" and are proud of them. The Chartreuse monks had blue long-haired cats many years ago.

Some writers have told us that long-haired cats are less affectionate than short-haired cats. This is a mistake, although long-haired cats, on the average, are more intense, more nervous, more highly strung, more pugilistic, and have more pluck and daring than the short-haired cats. The cat has great intelligence; in fact, is one of the most intelligent if not the most intelligent, of the domestic animals, and it is this fact that precludes the possibility of teaching the average cat tricks. For the cat sees through the manoeuvre, and refuses to be made a fool of. In respect to memory they are phenomenal and far exceed the average dog in this quality. Their powers of conversation are well developed, accompanied by delicate inflexions of the voice that need to be known to be understood. Dupont de Nemours says: "The cat has also the advantage of a language in which the same vowels as those pronounced by the dog exist, with six consonants in addition, m, n, g, h, v, and f." It requires study to get to know cats, and Rouvière, the actor, said that no one could really understand a cat unless he himself became one. A cat, of all the domestic animals, has retained the greatest part of its wild nature and traits, and the easiest way to get at a cat is by kindness and by trying to learn cat ways.

CAT, DOMESTIC

A cat never gives in to coercion. Liberty is the last thing it will resign; and often it will not resign that except in exchange for death. The cat should be used as the emblem of liberty.

It is a mistake to suppose that a cat cares only for places, for it is only the innate conservatism of the animal that gives this impression. Regularity is the keynote of its existence and what it does one day it likes to do the next; and certainly to places where it has been reared and has lived it shows great attachment. But on the contrary there are cats that would settle down anywhere, that have crossed and re-crossed the Atlantic Ocean, and have lived quietly in any locality their owners chose. A cat is one of the finest mothers on earth.

The fortunes of the cat are now more or less regulated by clubs and associations, and there are homes, hospitals, and refuges in many places and in many lands. The principal clubs are the National Cat Club founded in 1887, with headquarters in London; the Scottish Cat Club, founded in 1894; the Cat Club, London, founded in 1898; the Northern Counties Cat Club, the Silver and Smoke Persian Cat Society, the Siamese Club, and the Orange, Cream, Fawn, and Tortoise-shell, founded in 1900; the Black and White Club, the Blue Persian Society, the Chinchilla Cat Club, the Short-haired Cat Club, the Midland Counties Cat Club, the British Cat Club, and the Manx Cat Club, founded in 1901. All the above are in Great Britain, but many have members in America. In the United States there are the Beresford Cat Club, founded in 1899, with headquarters in Chicago; the Atlantic Cat Club, with headquarters in New York; the Chicago Cat Club, the Louisville Cat Club, the Pacific Cat Club, the Orange and Cream Society, with headquarters in Chicago, the Washington, D. C., Cat Club, the Detroit Club, etc. All these have been founded since 1899; so we can see that the advances made of late years have been sudden and rapid; and they will continue to grow; for shows are held in many of the principal cities and are yearly fixtures. The Chicago shows have brought together the largest number of cats, 259, at the show held in the Coliseum in January 1902. Prices for cats increase; and whereas \$25 was considered a good price five or six years ago, some of the best have been recently sold for \$250 each, and many at \$75 and \$100. The largest price of which we have record as having actually been paid in cash for a cat is \$300, which was the price Lady Decies paid Mrs. Greenwood for Lord Southampton; although I expect to see this exceeded in time to come, for competition enhances values, and the best specimens and most perfect will bring high prices from those who want them. All this will tend to draw attention to the cat and better the race and its general conditions.

Cats have had their artists: the Egyptians, the Japanese, the Chinese, Salvator Rosa, Gottfried Mind ("The Raphael of Cats"), Burbank (a master little known), Cornelius Wisscher, the Dutch artist, whose "Tom" cat has become typical, J. J. Grandville, Harrison Weir, Louis Wain, Madame Ronner, and Adam.

Members of the English royal family breed and exhibit cats at the regular exhibitions of the present day. Cats now have their regular stud-books, and their ancestry is carefully tabu-

lated. The oldest registry in America is the Beresford Cat Club Stud-Book in Chicago. Another has been started in Washington, called the United States Official Registry, but it is a private enterprise and has no direct connection with any government department. The two great registers in Great Britain are the National and the Cat Club stud-books.

A Few Hints to Breeders.—Do not try to keep too many; a good cat well reared will bring more money than 8 or 10 badly nurtured, undersized kittens. Cats are not gregarious, and when crowded together become diseased and mangy, and prematurely die. One litter of really good cats will give more pleasure and profit to the owner than five or six litters of poor ones.

Liberty is necessary to the health alike of the present and of the coming generations, and these latter should never be out of our minds when mating.

Meat is the main diet of all the *carnivora* to which order domestic cats belong. The best diet for cats is composed largely of meat, for which their teeth are adapted. Without meat they will not long remain healthy. They vary in their tastes, and what is fancied by one is not always preferred by another. Fish they are fond of, but as a rule house-cats should not be given much raw fish. Cats kept in confinement should have grass, vegetables, and changes of diet provided for them. Grass is a necessity.

Epidemics that sweep through different countries and continents at stated periods decimate the cat family, and it is well to be prepared for such occasions by having none but the healthiest and best of animals. Distemper, the greatest of cat scourges, is best treated by nursing, care, and cleanliness. Fleas convey embryonic worms which infest cats, and should be rigorously kept down. They breed in cracks in the floor, in bedding, and in the ground, and war waged upon their haunts will be work well laid out.

Do not use nauseating drugs for ailing cats, but choose the mildest remedies that will effect a cure. Do not be prejudiced against a course of treatment till you have tried it well; and remember that supposed cures suddenly made are not always effectual. Cats, when ill, require sympathy as much as human beings, and more so than any other animal, in order to battle successfully with disease, for they have a tendency to be very pessimistic and sorry for themselves, and to recover or fail quickly. They suffer mostly from distemper, worms, eczema, bronchitis, pneumonia, and liver diseases, and occasionally from catarrhal fever. If you are acquainted with a good homœopathic physician, and have any idea of what ails your cat, consult him and abide by his advice.

Do not breed from your queens too young, although many good kittens have been raised from queens not a year old, if strong and healthy. Male cats will not mate as early in life as the queens, and are seldom of much use till a year old. Do not cross long-haired cats with short-haired cats, for you spoil the type of both. Siamese cats will breed with other cats, but the progeny are never good for the show-room; and the Siamese being a distinct breed, does not amalgamate with any of the other varieties. The Manx cat is better kept pure, or

CAT-BIRD — CAT-SNAKE

the type degenerates and the result is not satisfactory.

Remember, when trying to rear good cats, that what goes in at the mouth and the care bestowed upon the young and growing animals cover 50 or even 75 per cent of essential requirements. The best blood in the world will not bring prize-winners or nice pets if they are badly reared. The crucial period takes in the first six months; when the young cat is well grown, and at seven months of age is through teething, you will have an animal that may live 20 years or more. Healthy cats are more long-lived than dogs, and authentic records tell of not a few over 20 years of age, and of some even 30.

Kittens should not be taken away from their mothers before they are at least eight weeks old; and if three months old, it will be still better. Care should be exercised in the diet of kittens at an early age. Sudden changes or sudden chills will bring on gastritis. Milk, unless pure, is more dangerous than meat, which in a raw state may be given scraped or minced at a very early age. Milk is better when mixed with Robinson's prepared barley according to the directions on the box, unless you can obtain warm milk from a cow that has not been too long in milk. The most dangerous diet for highly bred kittens is cold skimmed milk of an uncertain age.

Ladies who know how to bring up children properly can best rear kittens, and the care needed for the former is necessary to the latter. Science is a great help, but it will not offset the want of the most elementary principles of care and common sense.

Young cats are liable to fits, either when teething or from worms. Cats, when young, sometimes have fits. Quiet coaxing and attention will bring a cat through a fit, or a dose of belladonna will ward one off. Ordinary smelling-salts held to the nose of the cat may give relief, but as soon as possible the cause should be sought. Cats do not have follicular mange, but their troubles come from the blood. Ringworm is common in the cat tribe; it is communicable at a very rapid rate and must be vigorously combated.

To destroy a cat, or put it out of its misery when too sick to recover, administer a few drops of chloral, place the cat, if possible, in a tight box, and when the cat is fast asleep drop into the box a sponge saturated with two or three ounces of chloroform. Do not put a cat in a box with the chloroform before administering the chloral, for its struggles will be terrific. By the proper method the cat will glide out of existence without causing any trouble.

Ross, 'Book of Cats'; Frances Simpson, 'The Book of the Cat'; Harrison Weir, 'Our Cats'; H. M. Winslow, 'Concerning Cats'; and the following periodicals: 'Our Cats' (Manchester, Eng.); 'The Cat Journal' (Palmyra, N. Y.); 'Fur and Feather' (London); and the 'Ladies' Field.'

E. N. BARKER.

Cat-bird, one of two kinds of birds. (1) In North America a familiar songster (*Galeoscoptes carolinensis*) so called because of its mewing

call-note, which is strikingly similar to the plaint of a kitten in distress. It is about nine inches long, and of a dark slate color, with a black cap, and a reddish patch under the tail. It is migratory only in the northern States, spends its winters in the South, and frequents bushy pastures and gardens. It has a brilliant and varied song, in which it seems to mimic the notes of other birds. Its four or five dark greenish-blue eggs are laid in bushes where it nests. In habit it is lively, familiar, and unsuspicious. It frequently attacks the common blacksnake, which, in the absence of the bird, rifles its nest. (2) In Australia, one of the lower-birds (*Aluradus crassirostris*), so named because of its cat-like call.

Cat-boat, a boat having one mast stepped just abaft the stem, and carrying a sail laced to a boom and gaff, resembling a schooner's mainsail. In general cat-boats are very broad in beam, averaging 1:3. They are usually equipped with a centre-board, which, with the extreme forward position of the mast, enables them to point high into the wind, and makes them remarkably quick in stays. They are principally employed as pleasure craft on the coasts and inland navigable waters of the United States, and are consequently of shallow draft.

Cat Island, one of the Bahama Islands, about 46 miles in length from north to south, and three to seven miles in its mean breadth. Pop. 3,000. This island was long identified with the Guanahani of Columbus, the first portion of land belonging to the New World on which he landed, 12 Oct. 1492. It is now thought by most that not this island but Watling Island, lying a little to the southeast, is the true Guanahani, and first landfall of Columbus.

Cat-owl, any of several widely distributed large owls, so called because of their feline habits and cat-like face. The best-known American cat-owl is the barred owl (*Syrnium nebulosum*), one of the largest birds of its kind, large specimens reaching 24 inches in length. It has no ear-tufts, and the general color is whitish, everywhere transversely barred with deep umber brown, except upon the abdomen, where the stripes run lengthwise. It is a lover of the woods, where its coughing cry resounds afar in the darkness, and where it breeds in hollows or among the branches of trees. It is not migratory, and often nests very early in the spring. This owl has the reputation of being especially destructive of poultry, but in truth it lives mainly on mice, of which it devours vast numbers each season, and hence is the benefactor rather than the marauder of the farm. Consult: Fisher, 'Hawks and Owls of the United States.'

Cat-shark, any of various members of the *Scylliorhina*, a group of true sharks which are characterized by having two dorsal fins, the anterior of which is placed over or behind the ventrals, and by having the tail not bent upward. Some of these are called also "rousettes." The name cat-shark is also applied to the leopard-shark (*Triakis semifasciatus*).

Cat-snake, a small opisthoglyph (see OPISTHOGLYPHA) serpent (*Tarbophis vivax*) of Asia Minor and southeastern Europe. Its color is dull; it is sluggish in movement; and reaches

CATABANGENES — CATACOMBS

a length of three feet. It has long, recurved teeth in the lower jaw which serve to hold its prey (mainly lizards) until they are overcome by the snake's grooved poison-fangs. It is distinguished by being the only venomous snake of the opisthoglyph type in Europe.

Catabangenes. See CATUBANGANES.

Catacaos, *kä-tä-kä'ós*, Peru, a city centrally situated in the maritime department of Piura, and on the Piura River. It is about 70 miles east of Piura, the capital of the department. Pop. 25,000.

Catachre'sis, a term used in rhetoric with a somewhat vague signification. It denotes any trope or figure of speech that is considered to be too violent. Thus any trope, whether a metaphor, an instance of metonymy, or any other, may become a catachresis if it is stretched too far. For example, the scriptural phrase "the blood of the grape" is often quoted as a case of catachresis, because it is thought too violent a metaphor to use "blood" for the blood-red juice of the grape.

Cat'aclysm, in geology, a physical catastrophe of great extent, supposed to have occurred at different periods, and to have been the efficient cause of various phenomena observed in the surface configuration of localities. The belief in cataclysmic movements as geological agents has largely given place to that in the working of ordinary agencies over long periods of time.

Cat'acombs, subterranean caves or vaults used as burial-places. All nations have been accustomed to some outward manifestation of regard for the dead, such as funeral solemnities, the consecration of grounds for sepulture, the erection of monuments, etc. Some nations, as the Egyptians, constructed pyramids and labyrinths to contain the remains of the departed. Others, as the Phenicians and after them the Greeks, hollowed out the rocks for tombs, surrounding their towns with vast magazines, containing the bones of their fathers. Asia Minor, the coast of Africa, and Cyrenais, afford instances of these singular and gigantic works. The discovery of these monuments has always excited the curiosity of travelers and the attention of artists. The latter have applied themselves to learn from them the character of architecture and painting at different epochs; and though they have often found only coarse representations, the productions of art in its infancy or decline, they have occasionally met with types of perfection. Many monuments of this description have been preserved to our days, and still contain traces of the painting and architecture with which they were decorated. There are catacombs existing in Syria, Persia, and among the most ancient Oriental nations. But the revolutions in these countries, and the changes which they have occasioned, have deprived us of the documents which would have given us exact information regarding them.

The description of the catacombs in Upper Egypt gives us an idea of those whose existence is still unknown to us. They contain the history of the country, and the customs and manners of the people, painted or sculptured in many monuments of the most admirable preservation. The subterranean caves of these countries, like almost all of the kind, have their origin in quarries. From the depths of the

mountains which contain them, stone was taken, which served for the building of the neighboring towns, and also of the great edifices and pyramids which ornament the land. They are dug in a mountain situated in the neighborhood of the Nile, and furnished the Romans with materials for the construction of buildings in their colonial establishments. The excavations in these mountains are found throughout a space of 15 to 20 leagues, and form subterranean caverns which appear to be the work of art; but there is neither order nor symmetry in them. They contain vast and obscure apartments, low and irregular vaults, supported in different parts with piles left purposely by the workmen. Some holes, of about six feet in length and two feet wide, give rise to the conjecture that they were destined for sepulchres. Cells of very small dimensions, formed in the hollows of these obscure caverns, prove them to have been the abode of recluses.

In Sicily and Asia Minor a prodigious number of grottoes and excavations have been discovered containing sepulchres. Some appear to have served as retreats to the victims of despotism. The greater part are the work of the waters which traverse the mountains of these regions, as for instance the great cave of Noto, which passes for one of the wonders of Sicily. This cave, the height, length, and breadth of which are equal, has been formed by the Cassibili River, which runs at the bottom, and traverses it for the length of 100 fathoms. In the interior of this cave are a number of houses and tombs. At Gela, on the south coasts, there are abodes for the living and sepulchres for the dead, cut in the rocks; at Agrigentum subterranean caves, labyrinths, and tombs, arranged with great order and symmetry. There are also caverns in the environs of Syracuse which may be ranked with the principal monuments of this description, from their extent and depth, their architectural ornaments, and from some historical recollections attached to them. The catacombs in the tufa mountains of Capo di Monte, near Naples, consist of subterranean galleries, halls, rooms, basilicas, and rotundas, which extend to the distance of two Italian miles. Throughout there are seen niches for coffins (*loculi*) and hones. A description of them was given by Celano in 1643. They probably owe their origin to the quarries which afforded tufa for the walls of the cities Palæopolis and Neapolis, and afterward served as sepulchres for the Christian congregations.

The most numerous and extensive catacombs are those in the immediate neighborhood of Rome, at San Sebastiano, San Lorenzo, etc., the earliest of which of certain date belongs to the year 111 A.D. They are composed of interminable subterranean galleries, extending underneath the town itself as well as the neighboring country, and are said to contain not less than 6,000,000 tombs. The name of catacombs, according to St. Gregory, was at first applied to designate exclusively the cave in which the bodies of St. Peter and St. Paul were buried, and it was only at a later period that it came to be given to all the subterranean passages which were used as public burying-places. It is now regarded as certain that in times of persecution the early Christians frequently took refuge in the catacombs, in order to celebrate

there in secret the ceremonies of their religion; but it is not less certain that the catacombs served also as places of burial to the early Christians, and that in spite of the contrary opinion which prevailed for two centuries, and even down to our day, the catacombs were not for the most part abandoned quarries, but were excavated by the Christians themselves. It is found that originally the cemeteries of Rome were made up of separate tombs, which rich Christians constructed for themselves and their brethren, and which they held as private property under the protection of the law. But in course of time this was changed. At the end of the 2d century there existed certain cemeteries not the property of individuals but of the Church. Such was that which Pope Zephyrinus (202-19) intrusted to the superintendence of Calixtus, and which took its name from that bishop. Some years later, under Pope Fabian (236-51), there were already several such common burying-places belonging to the Christian congregations, and their number went on increasing till the time of Constantine, when the catacombs ceased to be used as burying-places. From the time of Constantine down to the 8th century they continued to be used as places of worship by the Christians, but during the siege of Rome by the Lombards they were in part destroyed, and soon became entirely inaccessible, so that they were forgotten. The first excavations in them were made by Antonio Bosio between 1500 and 1600. The results of these excavations were published in his 'Roma Sotterranea' (Rome, 1632), which was translated into Latin by P. Aringhi (Rome 1657). Among the more modern works on the subject may be mentioned: Rochette's 'Tableau des Catacombes de Rome' (Paris 1837); Perret's 'Les Catacombes de Rome' (Paris 1851-6); and 'La Roma Sotterranea Cristiana' by De Rossi (Rome 1864-77), containing the results of very careful investigations made by the author, who is justly regarded as the foremost student, in fact, father of this branch of archaeology.

The catacombs of Paris, situated on the left bank of the Seine, are almost equally celebrated. The name itself, which has been given to this labyrinth of caverns and galleries from its resemblance to the asylums and places of refuge of the persecuted Christians under Naples and Rome, informs us of the purpose to which it has been applied since 1786. These galleries were originally the quarries from which materials were excavated for constructing the edifices of the capital. The weight of the superincumbent houses rendered it necessary to prop them; and when the cemeteries of the demolished churches and the burying-grounds were cleared in 1786, the government resolved to deposit the bones in these quarries, which were consecrated for that purpose. The first cemetery that was suppressed was the Cimetière des Innocents, and the bones from it were deposited beneath what is now Petit-Montrouge. The ossuary now extends much farther. The relics of 10 or more generations were here united in the repose of the grave. Many times as great as the living tide that rolls over this spot is its subterranean population. By the light of wax tapers, a person may descend about 70 feet to a world of silence, over which the Parisian police keep watch as strictly as over

the world of noise and confusion above. He will then enter a gallery where only two can go abreast. A black streak on the stones of the walls points out the way, which, from the great number of by-passages, it would be difficult for the visitor to retrace without this aid or without guides.

Among the curiosities here is a plan of the harbor of Mahon, which an ingenious soldier faithfully copied from memory, in the material of the quarries. Entering the hall, one is ushered into the realms of death by the inscription which once stood over the entrance to the churchyard of St. Sulpice: "*Has ultra metas requiescunt beatam spem expectantes*" ("Beyond these bounds rest those awaiting the hope of bliss fulfilled"). Narrow passages between walls of skeletons; chambers in which monuments, altars, candelabra, constructed of human bones, with festoons of skulls and thigh-bones, interspersed occasionally with inscriptions, not always the most happily selected, from ancient and modern authors, excite the gloomy impression which is always produced, even in the most light-minded, by the sight of the dissolution of the human frame. Wearied of these horrible embellishments, the visitor enters a simple chapel, without bones, and containing an altar of granite. The inscription "D. M. II et III Septembr. MDCCXCII." recalls to memory the victims of the September massacres, whose remains are here united. On leaving these rooms, consecrated to death, where, however, the air is always preserved pure by means of air-holes, the visitor may pass to a geological cabinet, formed by Héricart de Thury, the director of the Carrières sous Paris. Specimens of the minerals furnished by the regions traversed, and a collection of diseased bones, in a contiguous hall, scientifically arranged, are the last curiosities which these excavations offer. More than 600 yards to the east of the road to Orleans the visitor finally returns to the light of day. Strangers may visit the catacombs in company with the government officials at the periodical visits. An account of these subterranean passages is that which was published by M. Dunkel in 1885.

The Etruscan tombs were not, strictly speaking, catacombs, yet as subterranean places of sepulture they may appropriately be referred to. They were usually hewn out of cliffs on the sides of a hill and were variously arranged, sometimes tier above tier and sometimes on a level. There was a central chamber with smaller ones opening from it. In the latter there were stone benches to receive the bodies of the dead.

Catacoustics, kät-a-koo's'tiks or -kows'tiks, the science which treats of reflected sounds, or that part of acoustics which considers the properties of echoes.

Catafalque, kät'a fälk, an ornamental structure, in the form of a scaffolding or stage, for temporary use at ceremonious funerals. It is placed over the coffin containing a body lying in state, as in a church or other public edifice, and is sometimes used as a hearse, or set, as the representation of a tomb, over a grave.

Cat'alan, a native of Catalonia, or north-eastern Spain, or the language of Catalonia, which holds a position similar to the provençal,

CATALAN — CATALANI

having been early cultivated, and boasting a considerable literature. It was established as a literary language by the close of the 13th century, and is still to some extent used as such in its own region.

Cat'alan, a blast furnace for reducing ores, extensively used in the north of Spain, particularly in the province of Catalonia. It consists of a four-sided cavity or hearth, which is always placed within a building and separated from the main wall thereof by a thinner interior wall, which in part constitutes one side of the furnace. The blast-pipe comes through the wall, and enters the fire through a twyer which slants downward. The bottom is formed of a refractory stone, which is renewable. The furnace has no chimneys. The blast is produced by means of a fall of water, usually from 22 to 27 feet high, through a rectangular tube, into a rectangular cistern below, to whose upper part the blast-pipe is connected, the water escaping through a pipe below. This apparatus is exterior to the building, and is said to afford a continuous blast of great regularity; the air, when it passes into the furnace, is, however, impregnated with moisture.

Catalan Grand Company, The, a name of a troop of adventurers raised by Roger di Flor about the beginning of the 14th century. Roger first gave his services to Frederick, king of Sicily, in his war with Robert, Duke of Calabria, but when peace was concluded between the two princes, being at a loss how to maintain his soldiers, he proposed to lead them to the East to contend against the Turks, who were then desolating the eastern empire. Andronicus, then emperor of the East, gladly accepted the offered assistance of Roger, and submitted to all the conditions which he imposed. Roger set sail from Messina, Sicily, in 1303, with 26 vessels partly equipped at his own expense. The number of the troops embarked with him is said to have amounted to about 8,000 men of different nations, Sicilians, Catalans, Aragonese, etc. The Catalans, either because they were the most numerous or for some other reason, gave their name to the whole company. On his arrival at Constantinople Roger was received with great rejoicings, and was elevated to the dignity of grand duke. A bloody affray between the Genoese and the Catalans marked the first period of the stay of these adventurers in Constantinople. Andronicus hastened to get them to cross over into Asia. This they did in the spring of 1304, and in the same year they defeated the Turks completely. In 1305 he took Ancyra, and forced the Turks to raise the siege of Philadelphia, but he was not so successful in his attempt to take Magnesia. After a long and ineffective siege he recrossed into Europe in 1306, bringing along with him his Catalans, who left behind them everywhere traces of their plunder and violence. When they had reached Europe they took up their quarters at Gallipoli. But Andronicus, who was by this time very anxious to be rid of his formidable allies, now received Roger with great coldness, and even obliged him to give up his title of grand duke in favor of Berengarius. The sudden departure of Berengarius, however, and the simultaneous incursions of the Turks into Asia Minor, compelled Andronicus

again to appeal to Roger and his Catalans for assistance. Roger was raised to the dignity of Cæsar to appease him for the slights that had been put on him. But this only caused him to be regarded with more jealousy by the Greeks, and especially by Michael, the son of Andronicus, who was associated with his father in the empire. The result was that before he could start once more for Asia he was assassinated (1306 or 1307). The Catalans now turned their arms against the Byzantines, in order to avenge the death of their leader, and defeated them in several battles. They then passed into Greece and entered the service of the Duke of Athens, but no long time afterward they turned against him and defeated him in the battle of Cephissus (1311). They now became masters of Attica, where they maintained themselves for four years, when they were finally defeated by Philes near Bizyn (1315).

Catalanganes, *kä-tä-län-gäns'*, a Malay people of Mongoloid type, living in the flood plain of the Catalangan River (province of Isabela, Luzon). They are heathen and peaceable, and speak the same language as the Irayas.

Catalani, Alfredo, *äl-frä'dō kä-tä-lä'nē*. Italian composer: b. Lucca 19 July 1854; d. Milan 7 Aug. 1893. He was graduated at the Paris Conservatory and settled in Milan, where he achieved fame with brilliant operas, especially 'Dejanice,' 'Loreley,' and 'La Wally.'

Catalani, Angel'ica, Italian singer: b. Sinigaglia, most probably in 1782, although several other years are given; d. Paris 13 June 1849. As early as her 7th year her magnificent voice had become the subject of general remark, but it was not till the age of 14 that she received any instruction in the higher departments of the musical art. At 16 she was compelled by family misfortunes to turn her talents to account, and made her first appearance on the stage at Venice. She afterward filled the grand soprano parts at the operas of Milan, Florence, Rome, and Naples, and in 1799 accepted an engagement at the opera of Lisbon, where she continued for five years. She then visited successively Madrid, Paris, London, and the principal towns of Great Britain, in all of which her success and profits were immense. In 1814 she returned to Paris to take the management of the Italian opera there, but sustained thereby severe pecuniary losses from the injudicious interference of her husband, De Valabrégue, formerly a captain in the French army. On Napoleon's return in 1815 she was obliged to resign the direction of the opera, but resumed it again on the second restoration. In 1818 she again resigned the direction of the opera, and from that year till 1828 made repeated professional tours through the Continent and Great Britain. In 1830 she retired from public life to a villa in the neighborhood of Florence, and here she resided with her family and gave instruction to girls who manifested indications of local talent, one condition being required from them that they should adopt the name of Catalani. She was a woman of majestic appearance, and her voice displayed a wonderful degree of power, flexibility, and compass. She rather, however, astonished and overpowered an audience than touched or subdued their hearts by her marvelous execution.

CATALAUNIAN PLAIN — CATAMARCA

Catalau'nian Plain, the wide plain around Châlons-sur-Marne, in France, famous as the field where Actius, the Roman general, and Theodoric, king of the West Goths, gained a complete victory over Attila and the Huns, 451 A.D.

Cataldo, kă-tăl'dō, St., Italy, a town in the province of Caltanissetta, five miles west-south-west of the town of Caltanissetta. The sulphur works in the environs produce annually about 1,875 long tons. Pop. 12,800.

Cat'alepsy, a peculiar motor phenomenon, not a disease, that is found in a number of nervous disorders. It consists of a persistent muscular attitude of some part of the body, and may or may not be attended by unconsciousness. Thus a person may place the right arm or leg, or another may so place the limb, in a peculiar, or awkward, or in fact any position. This position is maintained by the patient for a very long time, usually a time much longer than a normal individual could maintain it. Almost any muscle group may be involved. The patients may squat on the floor, or stand on one leg for hours, or hold both arms in the air almost all day. There seems to be some form of muscle anesthesia and the position of the limb seems to be unknown and unfelt by the patient. This symptom is very frequent in cases of true hysteria, and it is also found in a number of other affections that cluster about hysteria. Thus it is present in somnambulism, in hypnosis, in a peculiar mental state known as catatonia, and in stuporous melancholia,—all of which have much in common, being affections superimposed on the hysterical nervous organization, a type of make-up of a character, whose main features are assuming a definite recognition by students of the functions of the nervous system. See Janct. 'Mental State of Hystericals'; Raymond, 'Obsessions et Psychasthenies'; Starr, 'Text-Book of Nervous Diseases' See HYSTERIA.

Cataloguing. See LIBRARY.

Catalo'nia, Spain, an old province (ancient TARRACONENSIS), bounded north by France, east by the Mediterranean, south by Valencia, and west by Aragon; area, 12,480 square miles. The country in general is mountainous, but intersected with fertile valleys, while the mountains themselves are covered with valuable woods and fruit-trees, as the slopes are plentifully supplied with water by an artificial system of irrigation. The main river of Catalonia is the Ebro; there are also the Segre, Ter, Llobregat, and many smaller rivers. Corn, wine, oil, flax, hemp, legumes, and almost every kind of fruit, are abundant. There are also quarries of marble of all colors, of crystal and alabaster; mines of lead, tin, iron, alum, vitriol, and salt, and formerly of gold and silver. On the coast is a coral-fishery. Catalonia is naturally much less fertile than either of the Castiles; but it surpasses every other province in Spain in the industry and intelligence of its inhabitants, and the improvements which have been effected in manufactures, agriculture, and commerce. It comprises the modern provinces of Tarragona, Gerona, Lerida, and Barcelona. The principal towns are Barcelona, Tortosa, Tarragona, Gerona, Manresa, and Lerida. Pop. 1,980,000.

Catal'pa, a genus of deciduous trees of the natural order *Bignoniaceæ*. There are about eight species, all natives of the northern hemisphere, four being hardy in cool temperate climates. They are all ornamental because of their large, bright-green leaves and conspicuous panicles of large, two-lipped, bell-shaped, white or yellowish flowers followed by long pods which persist until spring. Several of the species are highly esteemed for their timber, which is especially valued as fence-posts and railways because of their durability when in contact with the soil. For this reason they are frequently planted, especially *C. speciosa*, which is one of the hardiest. They are easily propagated by seeds sown in spring or by ripewood cuttings, and they succeed well upon moist loams from New England southward. A leaf-spot disease, *Phyllosticta catalpa*, which sometimes attacks the foliage, may be controlled with any standard fungicide (q.v.).

Catalytic Action, Catalysis, or Catalysm.

When chemical decomposition is brought about in any compound, and its ingredients are made to enter into new combinations in consequence of the introduction of another body, which does not itself form a part of any of these combinations, nor lose either of its constituents, but acts in some manner not understood, apparently by its mere presence or contact, to excite this chemical action, the force is called by Berzelius catalytic. A small quantity of yeast thus acts to cause a mixture of sugar and water to ferment, and form the new combinations of carbonic acid and alcohol; the addition of a small part of oxalic acid to boiling syrup of sugar, causes it to become fluid as water, and refuse to crystallize. Liebig objected to this introduction of a new theoretical force, which does not actually explain the phenomenon by giving it a name, but tends to satisfy the understanding with a plausible explanation, and thus hinder further research.

Catamaran, kăt'a-ma-răn, a sort of raft used in the East Indies, Brazil, and elsewhere. Those of the island of Ceylon, Madras, and other parts of the Indian coast, are formed of three logs. The timber preferred for their construction is the dup-wood or *cherne-maram*, the pine-varnish tree. Their length is from 20 to 25 feet, and breadth $2\frac{1}{2}$ to $3\frac{1}{2}$ feet. The logs of which they are constructed are secured together by means of three spreaders and cross lashings through small holes. The centre log is much the largest, and is pointed at the fore end. These floats are navigated with great skill by one or two men in a kneeling posture. They think nothing of passing through the surf which lashes the beach at Madras, and at other parts of these coasts, when even the boats of the country could not live upon the waves, and they are also propelled out to the shipping at anchor when boats of the best construction would be swamped. In the monsoons, when a sail can be got on them, a small outrigger is placed at the end of two poles as a balance, with a bamboo mast and yard, and a mat or cotton-cloth sail.

Catamarca, kă-tă-măr'că, Argentine Republic, a province, bounded north by Salta, east by Tucuman and Santiago del Estero, south by Cordova and Rioja, and west by Rioja and Chile; area, about 47,530 square miles. The

CATAMARCA — CATAPHRACTI

surface is very mountainous in parts, except the southern, where it stretches out into a large plain. The loftiest and best known of the mountains is the Sierra de Aconquija, which stretches from south to north, and attains in its culminating point near its southern extremity a height of more than 16,000 feet. The Santa Maria, flowing north to the Huachipas, is the only river of any importance, but as every valley has its mountain stream, the whole province is well watered. The soil is fertile, producing large crops of maize and wheat, and supporting large numbers of live stock, especially goats. The vine is also cultivated, and yields wine and spirits which bear a high name in the surrounding countries. The principal exports are beasts of burden, horned cattle, and hides and goat-skins, raw or tanned. The principal mineral is iron, but gold, silver, and lead are also found. The capital is Catamarca. Pop. 99,000, chiefly of Indian extraction, with a considerable mixture of Spaniards.

Catamarca, Argentine Republic, the capital of the province of Catamarca, situated in a valley 82 miles northeast of Rioja. It is connected by rail with Rioja and all the chief towns of the republic, and is the trade centre of a fertile district. It was founded about 1680, and has a fine church and a college. Pop. 7,500.

Catamount, a short form of the phrase "cat of the mountain," frequently found in the older books about America, and still occasionally used as a name for the lynx of the eastern United States, and sometimes for the puma, or "panther," once common in New England. The term is so indefinite that it is well that it has fallen into disuse.

Catanduanes, *kā-tān-dwā'nēz*, Philippines, an island lying northeast of the province of Albay, Luzon; its length is 44 miles north and south; width, 29 miles at the southern end; area, 704 square miles. The mountain system consists of three ranges that radiate from Mount Catilamong near the centre of the island; the rest of the surface is irregular, covered with low hills. The most important rivers are the Oco and the Bató or Cbugao; there are also a number of smaller rivers, and the island is well watered. The soil is fertile, and rice, cotton, corn, and hemp are raised; indigo and cocoanuts are exported. The natives find gold, both dust and nuggets, in the gravel beds of many of the rivers. The largest town is Birac (pop. 5,832). The island does not form a province of itself, but is a constituent part of the province of Albay, and is included in the military department of Luzon. Pop. 33,300.

Catania (ancient CATANA), Italy, a city of Sicily, in the province of Catania, on the borders of the valley of Noto, the see of a bishop, the suffragan of Monreal; 47 miles south-southwest of Messina, 85 east-southeast of Palermo. It is situated on a gulf of the Mediterranean, at the foot of Mount Ætna. This city has been repeatedly visited by violent earthquakes, and partially laid in ruins by lava from eruptions of Mount Ætna. The most disastrous eruption was that of 1669, by which many of the antiquities of Catania were overwhelmed, and the worst earthquake was that of 1693, when 18,000 people were destroyed. Although again greatly injured by the earthquake of 1783, Catania is now reviving with great splendor, and has much more

the features of a metropolis than Palermo. The principal streets are wide and well paved with lava. Most of the edifices have an air of magnificence unknown in other parts of the island, and the town has a title to rank among the elegant cities of Europe. An obelisk of red granite, placed on the back of an antique elephant of touchstone, stands in the centre of the great square, which is formed by the town hall, seminary, and cathedral. The cathedral, a fine building, was founded in 1091 by Count Roger, but required to be mostly rebuilt after the earthquake of 1693. It is dedicated to St. Agatha, the patroness of the city. The suppressed Benedictine monastery of St. Nicholas, comprising a church (with splendid organ), library, museum, and other extensive buildings, was long celebrated for wealth and splendor. The university was founded about 1445. The ruins of the amphitheatre, which was more extensive than the Coliseum at Rome, are still to be seen, as also the remains of the theatre, baths, aqueducts, sepulchral chambers, hippodrome, and several temples. The industries include the manufacture of silk and cotton goods, and the mining of sulphur. The harbor was formerly a good one, but by the eruption of 1669 its entrance was almost entirely choked up, and it is only in recent times that it has been improved, a considerable amount of money having been spent on it. The trade of Catania is of some importance, the principal export being sulphur, next to which come oranges and lemons, almonds and other fruits, and wine. Cereals, textiles, and other manufactures are the chief imports. The exports have an average annual value of about \$5,000,000. A circular railway runs from Catania round the base of Mount Ætna. Pop. 147,000.

Catanzaro, *kā-tān-zā'rō* (ancient CATACIUM), Italy, a city and capital of the southern province of the same name, on a height, eight miles from the Gulf of Squillace. It suffered severely from the great earthquake of 1783, but is still a place of some importance, defended by a citadel, and containing a cathedral and various other churches, an academy of sciences, one of the four great civil courts of the kingdom, a lyceum, and three hospitals. The manufactures consist chiefly of silk and velvet, and there is some trade in wheat, wine, oil, etc. Pop. about 30,000.

Cataphoresis, *kāt-a fôr-ē-sis*, a method of introducing remedies into the body by means of electricity. While certain substances can be made to penetrate the skin by means of electrical currents, the general cataphoretic method has not found favor with conservative and careful observers.

Cataphrac'ti, a group of fishes known also as "mailed-cheeked," characterized by having a bridge-like bone running from below the eye to the gill covers. The group includes the rock-fishes, scorpion-fishes, sculpins, sea-poachers, lump-suckers, and sea-snails. Most of these live in the sea, but in North America there are several species of sculpins which dwell in fresh-water streams and lakes, and are known as mullets. The names *Loricati* and *Parciophitæ* are also applied to this group. Consult: Jordan and Evermann, 'Fishes of North and Middle America.'

CATAPLASM—CATARACTS

Cat'aplastm, or Poultrice, some kind of soft compound intended to be applied hot to the surface of the body. Poultrices are commonly made of linseed-meal, oatmeal, bran, bread crumbs, etc., mixed with water, milk, or some other liquid. They are called sinapisms, or mustard poultrices, when mustard forms their base.

Cat'apult (Latin, *catapulta*; Greek *καταπέλτης*), a name for certain machines of the ancients for projecting missiles, chiefly arrows. *Ballista* (Greek, *πέτροβολοι* or *λίθοβολοι*), were engines somewhat similarly constructed, but were chiefly confined to the shooting of stones. *Tormentum* was a general name for all such machines. Catapults may be described as gigantic cross-bows, the most powerful of which consisted, not of a single beam or spring, but of two, inserted each into an upright coil of ropes, so twisted that the ends of the arms could not be drawn toward each other without producing a most violent recoil. These machines were described by the length of the arrow they were constructed to launch; thus there were three-span, two-ell, and other catapults. A three-ell catapult (*τριπήχος*) weighed 588 pounds, the arrow fully 4 pounds, and five men were required to work it. The effective range was about 1,200 feet. The missiles used in *ballista* varied in weight from 15 to 90 pounds. The Romans did not carry all the parts of these machines with them, but only the ropes and fastenings, with the necessary tools; and the soldiers built the catapults when they wanted them. They were chiefly used in siege operations. The terms *catapulta* and *ballista* were often used indiscriminately; and in later times the word *catapulta* went entirely out of use. Vegetius and Ammianus Marcellinus never introduce it, and employ *ballista* to signify all machines throwing large arrows or beams, and *onager* for those throwing stones. The catapult used by schoolboys generally consists of a y-shaped stick, to the arms of which are attached strong elastic bands united in the middle by a piece of soft leather. A small stone or a few shot are placed in the leather, which is then pulled back and suddenly released, the elasticity of the bands projecting the missile to a considerable distance. It is often used against small birds. See **ORDNANCE**.

Cat'aract, in medicine, an opacity of the crystalline lens of the eye, or of its capsule, or both. It is quite different from amaurosis, which is a disease of the retina, by which it is rendered unsusceptible to the action of light. In cataract the lens becomes opaque, loses its transparency, and is no longer capable of transmitting the light. The causes of cataract are numerous. Inflammation or injury to the lens may produce it. Sometimes it is ascribed to a state of the vessels of the part which prevents a proper nourishment of the lens or its capsule. It is produced by various diseases, such as gout, rheumatism, diabetes, or scrofula, and often accompanies old age. Sometimes children are born with cataract. Its earliest approach is marked by a loss of the natural color of the pupil; this becoming turbid or slightly gray. *Muscae volitantes* accompany this period. The opacity is not at first over the whole lens, but most frequently first attacks the centre portion; this being turbid and of a grayish color, while the surrounding portions remain transparent and of the usual black color. While it exists in

this degree only, the person can see in an oblique direction. The color of the pupil is various; mostly grayish-white or pearl-colored; sometimes milk-white, or of a yellowish-gray; now and then of a grayish-brown, and even of a dark brown or dark gray. The consistence of the lens differs in different cases, being either hard and even horny, or very soft, as if dissolved.

The treatment of cataract is by a surgical operation on the eye, and different operations have been tried and recommended. They all consist in removing the diseased lens from its situation opposite the transparent cornea. By one of these operations the cataract is depressed, removed downward, and kept from rising by the vitreous humor. This is called couching. Another operation is extraction, and consists in making an incision of the cornea and of the capsule of the lens, by which the lens may be brought forward and through the cut in the cornea. The third operation is by absorption. This consists in wounding the capsule, breaking down the crystalline, and bringing the fragments into the anterior chamber of the eye, where they are exposed to the action of the aqueous humor, and are at length absorbed. This last operation has the name *keratonyxis* applied to it, and is chiefly employed in the case of children, because the lenses of their eyes are soft. The choice of the operation is determined by the character of the cataract. After the operation the patient is to be kept from the light, and from all means of irritation.

Cat'aracts (from Latin, *Cataracta*, a "water-fall"), one of the names given to sudden descents in streams of water, the more general English term being fall or falls. A considerable declivity in the bed of a river produces rapids. When it shoots over a precipice it forms a cataract. If it falls from steep to steep, in successive cataracts, it is often called a cascade. In rocky countries rivers abound in falls and rapids. In alluvial districts, falls, of course, are very rare. Rapids and cataracts are often a blessing to rugged countries, since they furnish the cheapest means of driving machines in manufactories, etc. In recent times waterfalls have been utilized in the furnishing of electric power in addition to ordinary water-power. Many cataracts are remarkable for their sublimity, the grandest known being Niagara Falls (q.v.), on the Niagara River, between lakes Erie and Ontario. Some others of note are mentioned below.

The Montmorency River, which joins the St. Lawrence a few miles below Quebec, forms a magnificent cataract, 250 feet high. The Missouri, in the upper part of its course, descends 357 feet in 16½ miles. There are four cataracts, one of 87, one of 19, one of 47, and one of 26 feet high. The Yosemite River in California forms a series of magnificent falls, with a total descent of 2,600 feet. The first of them is a plunge of 1,500 feet, and is followed, after a series of beautiful cascades, by a final plunge of about 400 feet. Fully 200 miles from the mouth of the Hamilton River in Labrador there is a magnificent series of cataracts known as the Grand Falls, the largest having a height of over 300 feet. In Colombia, South America, a great cataract, that of Tequendama, is formed by the Bogotá River. The river precipitates itself through a narrow chasm, about 36 feet broad, to the depth of over 600 feet. On the Potaro

CATARMAN — CATCHFLY

River in British Guiana, the Kaieteur Fall, 740 feet high, and about 370 broad, is a splendid spectacle, and just below it is a second fall of 88 feet.

The most remarkable waterfall of Africa is one with which Dr. Livingstone's missionary travels first made us acquainted. This is a cataract on the Zambesi, called by the natives Mosioatunya ("smoke sounds here"), named by him Victoria Falls. The stream, about 1,860 yards broad, flowing over a bed of basaltic rock, is suddenly precipitated into a tremendous fissure, extending across the bed of the river from the right to the left bank, to the depth of about 370 feet. The breadth of this fissure or crack is only from 80 to 90 yards, and the pent-up waters, from which immense columns of vapor are continually ascending, are then hurried through a prolongation of the chasm to the left with furious violence. The so-called Cataracts of the Nile are not, properly speaking, cataracts. A more correct designation for them would be "rapids." The Stanley Falls on the Congo comprise seven cataracts. On the Tugela River in Natal there are the Tugela Falls. On the Umgeni River, in the same country, are the falls of the Great Umgeni (364 feet) and the Kar Kloof Falls (350). There seem to be no waterfalls of more note in Asia than those of the Cavery River of India.

One of the grandest falls in Europe is that of the Rjukanfoss ("smoking fall"), on the Maan River in Norway. The height of the cataract is 805 feet. In Sweden, on the Gotha River, a few miles below its outlet from Lake Wener, are the celebrated falls of Trollhatta, which have a height of over 100 feet. The cascade of Gavarnie, in the Pyrenees, is reputed the loftiest in Europe, being over 1,300 feet high. Its volume of water, however, is so small that it is converted into spray before reaching the bottom of the fall. Another waterfall in the Pyrenees is that of Seculéjo, in the neighborhood of Bagnères-de-Luchon. It ascends from the Lac d'Espingo, into the Lac de Seculéjo, or d'Oo, a singularly romantic mountain reservoir, from a height of 820 feet, and is the most copious of the Pyrenean waterfalls. The Swiss Alps likewise contain some falls of great sublimity. At Lauterbrunnen, in addition to numerous other cascades, is the renowned fall of the Staubbach, about 870 feet high, which, however, from its small volume of water, has none of the terrific adjuncts of a cataract, and resembles, in front, a beautiful lace veil suspended from the summit of the precipice. Near Martigny is the picturesque waterfall of the Sellesche or Pissevache, the final leap of the cascade being 128 feet. The falls of the Rhine at Schaffhausen are renowned over Europe. They are 300 feet broad, and nearly 100 feet high. In Italy the falls of Terni, or the Cascade del Marmore on the Velino, have been immortalized by Lord Byron, and though artificial, are justly regarded as among the finest and most picturesque in Europe. They consist of three falls, the aggregate height of which may be estimated at 550 feet. The falls of the Anio or Teverone, at Tivoli, are likewise very beautiful. They, too, are artificial, and have a fall of about 80 feet.

Catarman, kä-tär-män', Philippines, a town on the north coast of the Island of Samar, situated on the Catarman River, 55 miles north-

northeast of Catbalogan. It has a good anchorage ground. In 1871 the town was destroyed by a volcano which burst forth in July from low land on the west side of island, and in two months had thrown up a hill two thirds of a mile long, one third of a mile wide, and about 450 feet high, destroying all vegetation for miles around. At the time of the visit of the Challenger, January 1875, the volcano had attained height of 1,950 feet, and was still active, there being visible columns of smoke by day and series of small fires at its summit by night. Pop. 10,482.

Catarrh, ka-tär', a flow from a mucous membrane. It is a symptom purely, and not a disease, and any mucous membrane of the body may be affected by an acute or chronic inflammation, usually entitled an acute or chronic catarrh; as, catarrh of the nasal mucous membrane, of the pharynx, larynx, stomach, intestines, rectum, bladder, vagina, etc. The word has general significance only, but it is much used by vendors of nostrums. See NOSE AND THROAT.

Catawba, Wateree', or Santee', a river rising in the Blue Mountains, N. C., near Morgantown. It runs east and then south into South Carolina, where it is known for some distance as the Wateree, but after the confluence of the Broad River, it takes the name of Santee, then runs east by south, and after a course of 270 miles falls by two mouths into the sea between Charleston and Georgetown. This river gives its name to a wine, the grape from which it is made having been first discovered near its sources.

Catawba, a light sparkling wine, of rich Muscatine flavor, produced in several parts of the United States. It is made from the Catawba grape, first found growing on the banks of the Catawba River in the Carolinas. This wine is now in extensive use, and is gradually superseding Rhemish and French sparkling wines, to which, in general character, it bears a resemblance. See WINES.

Catbalogan, kat-bā-lō-gān, Philippines, capital of the province of Samar, situated on a small bay at the mouth of the Antigas River on the west coast. It is protected by a number of islands, Daram being the largest. The anchorage ground is not safe during the monsoon weather; Parasan Island Bay, 10 miles west, is then the refuge for vessels. The town has a large trade in hemp and coconut-oil with Manila, and steamers from Manila call every two weeks. Pop. 6,450.

Catch, a short piece of music written generally in three or four parts. It is a sort of short canon, the second voice taking up the theme when the first has completed the first phrase, the third following the second in same manner. These compositions are most frequently of a humorous and bacchanalian character, and have been from Purcell's time very popular in England.

Catchfly, any one of several plants of various genera. The name is perhaps most commonly applied to species of *Silene* of the natural order *Caryophyllaceae*, since their calyces and stems exude a clammy, sticky substance which attracts flies and holds and kills those that alight. Certain species of *Lychnis*, especially *L. viscaria*, a closely related genus, are also popularly called by this name. Sometimes,

CATEAU — CATECHISM

too, the Venus flytrap is called Carolina catch-fly. See CARNIVOROUS PLANTS; LYCHNIS; SILENE.

Cateau, kā-tō, Le, or Cateau-Cambrésis, kan-brā-zē, France, a town in the department of Nord, on the right bank of the Selle, 15 miles east-southeast of Cambrai. It was once fortified, though now open, and is famous for the treaty of its name signed here in 1559, by which Henri II. of France gave up Calais to the English; and agreed to abandon all he had conquered from Spain on condition that that country would do the like with her French conquests. Altogether France lost 189 fortified towns by the treaty. Le Cateau has manufactures of cotton, wool, merinos, cambric shawls, and a considerable trade in them, and in wine, iron, coal, and agricultural products in general. Pop. 10,500.

Catechesis, kăt-ē-kē'sis, the science which teaches the proper method of instructing beginners in the principles of the Christian religion by question and answer, which is called the catechetical method. Hence catechist and catechize. The art of the catechist consists in being able to elicit and develop the ideas of the youthful mind. This part of religious science was first cultivated in modern times, and Rosenmüller, Daub, Winter, Heinrich, Müller, Schwarz, Palmer, and others, have particularly distinguished themselves by their writings upon it.

Catechetical (kăt-ē-kēt'ī-kāl) Schools, institutions for the elementary education of Christian teachers, of which there were many in the Eastern Church from the 2d to the 5th century. They were different from catechumenical schools, which were attached to almost every church, and which were intended only for the popular instruction of proselytes and children; whereas the catechetical schools were intended to communicate a scientific knowledge of Christianity. The first and most renowned was established about the middle of the 2d century, for the Egyptian Church at Alexandria, on the model of the famous schools of Grecian learning in that place. (See ALEXANDRIAN AGE.) Teachers like Pantænus, Clement, and Origen gave them splendor and secured their permanence. They combined instruction in rhetoric, oratory, and music, in classical Grecian literature, and the Eclectic philosophy, with the principal branches of theological study, exegesis, the doctrines of religion, and the traditions of the Church; distinguished the popular religious belief from the *Gnosis*, or the thorough knowledge of religion; established Christian theology as a science, and finally attacked the dreams of the Chiliasts (believers in a millennium); but by blending Greek speculations and Gnostic phantasies with the doctrines of the Church, and by an allegorical interpretation of the Bible, contributed to the introduction of heresies. The distraction of the Alexandrian Church by the Arian controversies proved the destruction of the catechetical schools in that place about the middle of the 4th century. The catechetical school at Antioch appears not to have been a permanent institution like the Alexandrian, but only to have been formed around distinguished teachers, when there happened to be any in the place. There were some distinguished teachers in Antioch about the year 220. We have no certain information, however, of the theological

teachers in that place, such as Lucian, Diodorus of Tarsus, and Theodore of Mopsuestia, until the latter part of the 4th century. These teachers were distinguished from the Alexandrian by more sober views of Christianity, by confining themselves to the literal interpretation of the Bible, by a cautious use of the types of the Old Testament, and by a bolder discussion of doctrines. The Nestorian and Eutychian controversies, in the 5th century, drew after them the ruin of the schools at Antioch. Of a similar character were the schools instituted at Edessa in the 3d century, and destroyed in 489, and the school afterward established at Nisibis, by the Nestorians, in its stead; both of which were in Mesopotamia. To these schools succeeded, at a later date, the cathedral and monastic schools, especially among the western Christians, who, as late as the 6th century, made use of the heathen schools, and had never established catechetical schools even at Rome.

Cat'echism, a form of instruction by question and answer, especially instruction in Christian doctrine by that method; and not the instruction only, but the book in which the questions and answers are contained. The Catechetical school of Alexandria was an institution designed to instruct pagans in the doctrines of the Christian Church (2d century). Its founder, Pantenos, was a Greek convert deeply learned in the Grecian philosophy and in the Hebrew Scriptures. Among his disciples was Titus Flavius Clemens, who became his successor as head of the school; and to Clemens (Clement of Alexandria) succeeded the illustrious Origen, who, at the early age of 18, was deemed worthy to be named to so responsible a post.

The catechetical instruction given by these masters of the Alexandrine school was conveyed rather in the form of lectures than in that of question and answer. The more familiar instruction given to catechumens in the early Church was of the same nature, but more simple and elementary. In the latter half of the 4th century St. Cyril, bishop of Jerusalem, composed 23 lectures, or in Greek *katacheseis*, of which 18 were addressed to postulants for baptism (catechumens) and five to the neophytes after their baptism. These latter he called mystagogic catecheses, or instruction in the mysteries of Christianity. They are of a more popular character than the catecheses of the Alexandrines, and are believed to be the first example of a popular compendium of the Christian doctrines.

In the Roman Catholic Church the Catechism of the Council of Trent, or Roman Catechism or *Catechismus ad Parochos* (Catechism for Parish Priests) is addressed especially to pastors and others having cure of souls, suggesting to them the manner of expounding Christian doctrine and of enforcing the precepts of Christian morality in their sermons from the pulpit and in conveying religious instruction to the young. It is also designed as a basis and model in composing short expositions of Christian doctrine for popular use among the laity. The Catechism of the Council of Trent was first published in 1566 in Latin, and formed a considerable volume, 500 pages 8vo. A decree of the Council of Trent ordered all bishops to "take care to have the Catechism faithfully translated into the vernacular language and expounded to the people by all pastors." Translations were accordingly

made into Italian, French, Spanish, and German. The first English translation was not published till 1829. It is a large octavo, closely printed, of over 400 pages. The work possesses high authority, but not the highest; it does not rank with the creeds of the Church or with the canons and decrees of councils or the dogmatic definitions of Popes.

All the principal divisions of Protestantism — the Anglican Church and its offshoots, the Lutheran and Calvinistic churches, the Presbyterians, Methodists, and Baptists — have catechisms. Many of these Protestant catechisms, as the Catechism of Luther, the Calvinist of Geneva, the Westminster Larger and Shorter catechisms, the Catechism of the Church of England, possess in their several churches an authority equal or comparable to that of their several creeds or confessions of faith.

Catechist. See CATECHISM.

Cat'echu, an earthy or resin-like substance, used in dyeing and calico-printing, and in medicine as an astringent. It is obtained by boiling the leaves, wood, and fruit of certain plants growing in India and other eastern countries (notably the *Acacia catechu*), and concentrating the extract by evaporation until it will solidify. Catechu (known also in the trade as "cutch") consists mainly of catechu-tannic acid, which is soluble in cold water, and catechin, which is insoluble in cold water, but soluble in hot water. In medicine catechu is of service because of the tannin that it contains. It acts as an astringent and is serviceable in diarrhoea and dysentery. Catechu is also used in lozenges for affections of the mouth and throat.

Catechumen, a person who is under instruction and probation preparatory to admission to membership in the Christian Church through baptism. On the day of Pentecost and in the early days of the Church's mission the converts to the religion of Jesus Christ were admitted through baptism to fellowship in thousands at a time, without any preliminary inquiry into their dispositions, and without any instruction in the articles of Christian belief or the new obligations contracted by admission into the Christian body. But when the first enthusiasm of conversion had cooled doubtless many were found who "walked no more" in the way of the apostles and went back to their pagan or their Jewish beliefs and practices, or worse, who after two changes of religion lapsed into open contempt of all religion and of all morality. To guard against the scandal of such apostasies the Church provided a system of preliminary graduated instruction and probation for those who desired admission to the Christian communion. The candidates for admission to the Church, to the body of the faithful (believers, *fideles*, *pistoi*) were called catechumeni (persons under instruction) and even in this class there were three or even four separate grades. There was the first grade, that of those who, having expressed a desire for admission were put under instruction privately by some officer of the Church: this class was not admitted at all to the assemblies of the faithful. Those in the second grade, that of the *acroomenoi*, *audientes*, hearers, were admitted to the assembly for worship, but were required to withdraw after the reading of the stated passages from the evangelic and apostolic books and the sermon or

exhortation by the bishop. Those of the third grade, the *gonyclinontes*, *genuflectentes*, those "bending the knee," that is, who join in the prayers of the faithful, remained in the congregation till certain prayers in the liturgy were said and the bishop had pronounced his benediction. The fourth grade included all those who, having passed the first three were to receive the rite of baptism and thereby were to be admitted to full communion with the faithful on the next stated day for administration of that sacrament: these are the *photizomenoi*, instructed, or *competentes*, or *electi*. The first two grades are not recognized as two by all Church historians.

Such a term of preliminary instruction and probation was imperatively necessary in the ages of persecution, to save the Christian body from the scandal of apostasy on the part of converts who entered the Church either from unworthy motives, as, for example to act as informers; or who entered without weighing the obligation they assumed to lead a holy life void of all offense, and who disgraced their Christian profession by their disorderly lives. The institution of the catechumenate persisted after the peace of the Church was proclaimed by the first Christian emperor, and indeed the need of it was greater now that the profession of the Christian religion seemed the gateway to honor and power in the state instead of to martyrdom. The press of candidates for admission to the Church was great; and even the children of believers like converts from the pagan religion had to pass through the catechumenal grades. Out of this grew a great abuse and a great scandal. Men who sought admission to the Church for other reasons than a desire to lead a Christian life, would enter themselves as catechumens, postulants, and would continue in that grade for an indefinite period, not pledging themselves to observance of the law of Christ and the Church till the end of their life was at hand. Nor was it the converts from paganism alone that thus deferred baptism, as Constantine did, but the children of Christian parents often followed their example. Yet the motive for deferring baptism was not always a desire to evade the obligations of the Christian profession; in very many instances the delay was prompted by a conscientious scruple lest the baptized person falling from grace afterward should commit a sin that could never be condoned: among illustrious men who for a time acted on this scruple are numbered even doctors of the Church — Saints Ambrose, Gregory of Nazianzum, Augustin.

The ancient church edifices provided for the separation of the catechumens from the faithful that were in full communion. In the ancient church of Saint Clement in Rome, the body of the building is divided off by stone constructions into the *presbyterium*, chancel or sanctuary for the clergy at the eastern end, a middle compartment for the faithful in full communion — the galleries here being reserved for the women — and in the western end, or front, a much larger compartment of the nave for the catechumens.

Category, in logic and philosophy, an assemblage of all the beings contained under any genus or kind ranged in order. Metaphysicians distribute all beings, all the objects of our thoughts or ideas, into certain genera or classes, which classes the Greeks call categories, and the Latins predicaments. The ancients, follow-

CATEL — CATFISH

ing Aristotle, generally make 10 categories. Under the first all substances are comprised, and all accidents or attributes under the last nine, namely, quantity, quality, relation, action, passion, time, place, situation, and habit. This arrangement, however, is now almost excluded. Descartes thought that all nature may be better considered under these seven divisions: spirit, matter, quantity, substance, figure, motion, and rest. Others make but two categories, substance and attribute, or subject and accident; or three, accident being divided into the inherent and circumstantial. The arrangement of the 10 categories was borrowed from the Pythagorean school. It is said to have been invented by Archytas of Tarentum. From him it passed to Plato (who, however, admitted only five categories — substance, identity, diversity, motion, and rest) and from Plato to Aristotle. The Stoics held four — subjects, qualities, independent circumstances, relative circumstances. The term categories is applied by J. S. Mill to the most general heads under which everything that may be asserted of any subject may be arranged. Of these, five are recognized by Mill; namely, existence, coexistence, sequence or succession, causation, and resemblance. This arrangement affords a general classification of all possible propositions, which must thus either affirm or deny the existence of one or more things or attributes, the coexistence, sequence, or resemblance of two or more things or attributes, or must affirm or deny that one thing is the cause of another. Causation, however, is regarded by him only as a peculiar case of succession, so that the five categories of Mill may be considered to be reduced to four, causation being omitted. For the categories of Kant, see KANT.

Catel, *kä töl*, Franz, German artist: b. Berlin 22 Feb. 1778, d. Rome 19 Dec. 1856. His earliest efforts were designs for illustrated almanacs. He then painted in oil and water colors, and took up his abode in Rome in 1812. Overbeck, Schadow, and Cornelius gave him much encouragement, and he painted historical and genre pieces, and landscapes, in which last-named department of his art he was especially successful. During a residence in Sicily, about the year 1818, he painted a large number of views of Mount Ætna, and other prominent places on the island. He died rich, directing his fortune to be invested for the benefit of poor artists.

Cat'enary, the curve assumed by a perfectly flexible cord supported at both ends and allowed to sag between supports. The cables of a suspension bridge hang in catenaries before any of the other parts of the bridge are attached. The effect of the weight of the road-way, etc., is to draw the cables into curves more nearly approaching the parabola.

Cat'erpillar, the larva of a moth or butterfly. The body is long and cylindrical, consisting, besides the head, of 3 thoracic and 10 abdominal segments, the last one forming the suranal plate. The three pairs of thoracic legs are solid, horny, and jointed, while the supports of the abdominal segments, of which there are five pairs, are soft and fleshy. Caterpillars are very voracious, the digestive canal being very large. The American silk-worm (*Teia polyphemus*), at the end of its life as a caterpillar, has eaten not less than 120 oak leaves weighing three fourths of a pound; its food, taken in 56 days,

equals in weight 86,000 times the primitive weight of the worm. The jaws of caterpillars are large, black, horny appendages, and are toothed on the cutting edge so as to pass through a leaf somewhat like a circular saw. The eyes are minute, simple eyelets, three or four on each side of the head, and only useful, probably, in distinguishing day from night. The silk is spun through the tongue-like projection (spinneret) of the under lip. It is secreted in two long sacs within the body. The thread is drawn out by the two fore feet, which are three-jointed and end in a single claw. The legs on the hind body, sometimes called prop-legs, are fleshy, not jointed, and end in a crown of hooks which curve outward, enabling the caterpillar to firmly grasp the edge of the leaf or a twig of its food-plant. Most caterpillars are more or less hairy or spiny, rendering them, when especially so, disagreeable to birds; besides this, they are bright colored, so that birds readily recognize them and waste no time over them, but search for the common green smooth-bodied ones, which are, however, so difficult of detection by the birds that plenty are left to become moths or butterflies. Certain caterpillars, as the currant-worm, though smooth-bodied, are brightly spotted; these, however, have a disagreeable taste. The bright colors are thus danger signals, hung out to warn the birds and other enemies.

Catesby, Mark, English naturalist: b. probably in London about 1679; d. London 23 Dec. 1749. He traveled in North America in 1710-19 and 1722-6, and published 'Natural History of Carolina, Florida, and the Bahama Islands' (2 vols. 1731-43), 'British-American Flowers,' and a work on the fishes, reptiles, and insects of the isle of Providence. German translations of the first and last appeared at Nuremberg.

Catfish, any of the fishes of the order *Nematognathi*, more especially of the family *Silurida*. This large family is characterized by having the body naked or covered with bony plates, but without true scales. About the mouth there are two or more barbels, the longest of which are at the corners of the mouth. There is usually a stout, generally serrated, spine in front of the dorsal fin, and another in front of each pectoral fin. These spines are likely to inflict considerable injury on the careless fisherman. There is a poison-gland connected with the pectoral spine of some of the smaller species, and wounds are very painful. This is one of the most widely distributed families of fishes, and is especially abundant in South America and Africa. Most of them live in fresh waters. There are estimated to be about 1,000 species.

The catfish are sluggish in their movements, securing their prey rather by stratagem than by swiftness. They are bottom-feeders and indiscriminate, so that although, on account of their size and abundance, they constitute an important element in the fish food of the countries they inhabit, their flesh is not considered of high quality in taste. North and middle America contain 100 or more species, of which a third, perhaps, are to be found in the United States and Mexico. The majority are not of much importance, but some are of great local value. At the head of the commercial list stands the

CATGUT — CATHARI

channel cats of the genus *Ictalurus*, which are found throughout the Mississippi valley and gulf States, and are caught in vast quantities not only for home use, but for export, as much as 2,000,000 pounds annually being dressed, packed in ice, and shipped from Morgan City, La., the central mart of the Atchafalaya River fisheries, which are in operation from September to May. The method of capture is by "trot-lines" from a few yards to a mile long. The catfish move with the season's temperature of the water, going down stream in winter and up in summer. At the season of the spring floods they are carried over the swamps and adjacent lands, and thousands are caught by the shorter "brush" lines. There is a regular collecting service of tugs. The Louisiana species most taken is the chucklehead (*I. furcatus*), which loves sluggish waters. A more northerly species, ordinarily 20 to 25 pounds in weight, is the "blue" or "white" channel cat (*I. punctatus*), which thrives in the colder, swifter waters of the Tennessee, Cumberland, and neighboring rivers, whose flesh is declared equal to that of the black bass. Both these have been acclimated in California. The largest of the American species is the great fork-tailed Mississippi cat (*Amiurus lacustris*), which inhabits all the lakes and big rivers from the Saskatchewan and Great Lakes to Florida and Texas, and reaches a weight of 150 pounds or more. The so-called Potomac River cat (*A. catus*) is the one most familiar in the east, since it abounds from the Delaware River to Texas, but is most common in the waters of Chesapeake Bay and southward to Florida. It is next in commercial value to the Great Lakes fish. It has a very wide head and large mouth, but seldom exceeds two feet in length. The smaller yellow cat (*A. natalis*) and other species of this genus are numerous in the interior, but not of great importance. (See BULLHEAD.) The mud cat or goujon (*Leptosteus olivaris*) is a slender pike-like fish with a very large, wide head and mouth, and a thick skin, which lives in the sluggish rivers of the southern States. It is sometimes five feet long and 100 pounds in weight, but is most repulsive in appearance; its flesh, however, is excellent, and is often sold, dressed, for that of the favorite western channel cat. Other genera and species go by such names as mud-cats, stone-cats, mad toms, etc., and will be found elsewhere described, as well as many foreign species of interest and value.

Consult, besides general works, Jordan and Evermann, 'Food and Game Fishes of America,' and the publications of the United States Fish Commission.

Cat'gut is made from the intestines of different quadrupeds, particularly those of sheep. The manufacture is chiefly carried on in Italy and France. The texture from which it is made is that which anatomists call the muscular coat, which is carefully separated from the peritoneal and mucous membranes. After a tedious process of steeping, scouring, fermenting, inflating, etc., the material is twisted, rubbed with horse-hair cords, fumigated with burning sulphur to improve its color, and dried. Cords of different size, and strength, and delicacy, are obtained from different domestic animals. The intestine is sometimes cut into uniform strips with an instrument made for the purpose. To prevent offensive effluvia during the process, and to get

rid of the oily matter, the French make use of an alkaline liquid called *eau de javelle*. Catgut for stringed instruments, as violins and harps, is made principally in Rome and Naples. For the smallest violin strings three thicknesses are used; for the largest seven; and for the largest base-viol strings 120. It is well known that the membranes of lean animals are tougher than those in a high-fed condition, and there can be no doubt that from the lean and small-sized Italian sheep strings superior to all others are produced. In Naples, whence the best treble strings, commonly called "Roman," are obtained, there are large manufactories of this article.

Cath'a, a genus of plants belonging to the order *Celastraceae*, or staff-tree family. The species are mostly natives of Africa, forming small shrubs, sometimes with spiny branches. *Catha edulis* is a native of Arabia, and from the leaves the Arabs make a beverage possessing properties analogous to those of tea or coffee. Under the name of *kât* or *cafta*, the leaves form a considerable article of commerce among the natives. Chewed, they produce wakefulness and hilarity of spirits.

Cathari, the name given to themselves by the adherents of numerous heretical sects, undoubtedly of Gnostic and Manichean origin, which swarmed in western Europe, and particularly in northern Italy and southern France in the 12th century. At that period society had much advanced in wealth and power, which brought their concomitant vices. There were many abuses prevalent in the Church, and some of the clergy led scandalous lives. The numerous heretical sects won adherents by violently and indiscriminately denouncing the entire hierarchy, from the Pope down to the monastic orders; but their tirades were not more emphatic than the philippics launched against the same scandals by sincere Catholics, their contemporaries, such as St. Bernard, St. Hildegard, St. Malachi, archbishop of Armagh, and others. But while these sought to procure the eradication of the current abuses by a reformation from within the Church, the Cathari (Gr. *katharos*, Lat. *mundus*, *purus*, and *puritanus*, pure, clean) aimed at nothing short of the total destruction of the dominant religion, of its whole system of belief and even of its moral teaching. For not only were the sects styled Cathari (including a host of offshoots of eastern manicheism), heretics and reformers, but in their inner circles, dualists, believers in the existence of two supreme principles, the one a good principle, God, and the other an evil principle, the creator of the material world. But open profession was not made of this tenet: it was communicated only to the inner circle in the several manichean sects, to the elect ones, the *perfecti*, but withheld from the mass of their followers, the *credentes*, the faithful vulgar. To these latter and to outsiders the adepts of the *arcana* of catharism made profession of being strictly reformers of a corrupt ecclesiastical system, and of profound regard for the letter and spirit of the moral law as taught in the apostolic writings. As already said, they enthroned the evil principle as creator of the physical universe; they believed in the divine mission of Jesus Christ, the Son of God, that is, of the good principle; but with the Docetæ they denied that the Son of God had assumed human nature really, and held that his

CATHARINE — CATHARINE I.

humanity was phantasmal only. In conformity with their tenet of a supreme principle of good and a supreme principle of evil, the initiates condemned as works of the flesh, the sacraments of the Church as a whole, and looked on the contract of marriage as sinful. They held absolute predestination: that all men belong to one or other of two classes, those who will infallibly be saved, and those who cannot possibly attain holiness: hence their doctrine that an infant dying immediately after birth, if it belongs to the class of those predestined to be lost, is punished as is Judas in hell. They dared not confess that on their principles the elect cannot lose the divine favor by sin; but they did teach that repentance is of no account, and that the sins of the people are forgiven by the rite (*consolamentum*) of laying on hands. This honor was only a concession to the prejudices of the ignorant vulgar: the *perfecti*, the initiates of the *arcana* of catharism held themselves to be superior to the moral law.

Cath'arine, the name of several Christian saints: 1. **ST. CATHARINE OF ALEXANDRIA**, a virgin of royal descent in Alexandria, who publicly confessed the Gospel at a sacrificial feast appointed by the Emperor Maximinus, and was therefore put to death, after they had vainly attempted to torture her on toothed wheels. 307 A.D. Hence the name of Catharine wheel (q.v.). No less than 50 heathen philosophers sent by the emperor to convert her in prison were themselves converted by her winning eloquence; whence she is the patroness of philosophers and learned schools. Having steadily rejected all offers of earthly marriage, she was taken in vision to heaven, where Christ plighted his troth to her with a ring. This subject has been a favorite one with many artists (as signifying the union of the redeemed soul with Christ); the Christ being usually represented as an infant. It has been suggested that the attributes of the unhistorical St. Catharine seem to have been derived from those of the actual Hypatia, a heathen who suffered death at the hands of Christian fanatics. St. Catharine's festival falls on 25 November. 2. **ST. CATHARINE OF SIENNA**, one of the most famous saints of Italy, was the daughter of a dyer in Sienna, and was born there in 1347. While yet a child she practised extraordinary mortifications and devoted herself to perpetual virginity. She became a Dominican, and therefore afterward a patron saint of the Dominicans. Her enthusiasm converted the most hardened sinners, and she was able to prevail upon Pope Gregory XI. for the sake of the Church to return from Avignon to Rome. She was given, it was said, extraordinary tokens of favor by Christ, whose stigmata were imprinted upon her body. She wrote devotional pieces, letters, and poems. an edition of which is Tomasseo's (Florence 1860). Her festival falls on April 30. 3. **ST. CATHARINE OF BOLOGNA** (1413-63), festival March 9, and **ST. CATHARINE OF SWEDEN** (d. 1381; festival March 22), are of less note.

Catharine, St., Order of, the name of two organizations of very different character: (1) The Knights of St. Catharine on Mount Sinai, an ancient military order, instituted for the protection of the pilgrims who came to visit the tomb of St. Catharine on this mountain. (2) An organization in Russia, constituting a distinction

for ladies, and instituted by Catharine, wife of Peter the Great, in memory of his signal escape from the Turks in 1711.

Catharine I., Empress of Russia: b. Ringen, near Dorpat, Livonia, 15 April 1684; d. St. Petersburg 17 May 1727. The early history of this remarkable woman is uncertain. According to some accounts she was the daughter of a Swedish officer named Rabe, who died shortly after she was born; according to others her father was a Roman Catholic peasant. She at first bore the name of Martha and entered the service of a clergyman named Gluck, at Marienburg, who caused her to be instructed in the Lutheran religion. Here she was married to a Swedish dragoon. But a few days after he was obliged to repair to the field, and the Russians, within a short period, took Marienburg in 1702. Martha fell into the hands of Gen. Tcheremetieff, who relinquished her to Prince Menzikoff. While in his possession she was seen by Peter the Great, who made her his mistress. She became a proselyte to the Greek Church, and assumed the name of Catharine Alexiewna. In 1708 and 1709 she bore the emperor the Princesses Anna and Elizabeth, the first of whom became the Duchess of Holstein by marriage, and mother of Peter III. The second became empress of Russia. In 1712 the emperor publicly acknowledged Catharine as his wife. She was subsequently proclaimed empress, and crowned in Moscow in 1724. Beside the daughters above named she bore the emperor five more children, all of whom died early. The Princesses Anna and Elizabeth were declared legitimate. When Peter, with his army, seemed irreparably lost on the Pruth in 1711 Catharine endeavored to win over the grand vizier; and having succeeded, by bribing his confidant with her jewels, she disclosed her plan to the emperor, who gave it his approbation, and was soon relieved. She afterward received many proofs of the gratitude of her husband. Peter even deemed her worthy of being his successor. But in the latter part of 1724 she fell under his displeasure. Her chamberlain, Moens, with whom she was suspected of being on too intimate terms, was beheaded on pretense that he had been bribed by the enemies of Russia. Menzikoff, who had always manifested much attachment to her, had now been in disgrace for some time, and Peter had very frequent attacks of bodily pain, with intervals only marked by dreadful explosions of rage. These circumstances made Catharine's situation critical, and her anticipations of the future must have been the more melancholy, as the emperor had uttered some threats of a change in the succession to her disadvantage. To prevent such an event she applied to Menzikoff; and by the prudence of Jaguschinski, a reconciliation was effected with the emperor. The empress and the favorite were laboring to confirm their improving prospects when Peter the Great died, 28 Jan. 1725. Catharine, Menzikoff, and Jaguschinski considered it necessary to keep the death of the emperor a secret until, by judicious arrangements, they had secured the succession of the throne to the empress. Theophanes, archbishop of Plescow, swore before the people and troops that Peter on his death-bed had declared Catharine alone worthy to succeed him in the government. She was then

CATHARINE II

proclaimed empress and autocrat of all the Russias, and the oath of allegiance to her was taken anew. At first the cabinet pursued the plans of Peter, and, under Menzikoff's management, the administration was conducted with considerable ability. But the pernicious influence of favorites was soon felt, and great errors crept into the administration. Catharine died suddenly, her death being probably hastened by excess in the use of ardent spirits.

Catharine II., Empress of Russia: b. Stettin 2 May 1729; d. St. Petersburg 17 Nov. 1796. She was a daughter of the Prince of Anhalt Zerbst and her name was originally Sophia Augusta. The Empress Elizabeth chose her for the wife of Peter, her nephew, whom she appointed her successor. The young princess accompanied her mother to Russia, where she joined the Greek Church, and adopted the name of Catharine Alexiewna, given to her by the empress. The marriage was celebrated 1 Sept. 1745. It was not a happy one, but Catharine found relief in the improvement of her mind. She was endowed with uncommon strength of character; but the ardor of her temperament and the ill treatment of her husband led her into errors which had the most injurious influence on her whole political life. In January 1762, the Empress Elizabeth died, and Peter III. ascended the throne. He lived in the greatest dissipation, and on such intimate terms with a lady of the court, named Elizabeth Woronzoff, that it was generally thought that he would repudiate Catharine and marry his mistress. The empress, therefore, was obliged to take measures for her personal security. At the same time Peter grew continually more and more unpopular with his subjects, which led to a conspiracy, at the head of which were the hetman, Count Rasumowski, Count Panin, the enterprising Princess Daschkoff, and a young officer of the guards, Gregory Orloff. All those who were dissatisfied, or who expected to gain by a change, joined this conspiracy. Panin and the greater part of the conspirators were actuated only by the desire to place the youthful Paul on the throne, under the guardianship of the empress and a council of the empire. But this plan was changed through the influence of the Orloffs. The guards were the first to swear allegiance to the empress on her presenting herself to them at Peterhoff on the morning of 9 July 1762; and Alexei Orloff prevailed on Teplow, afterward appointed senator, to read at the Kazan Church, instead of the proclamation of the conspirators in favor of the young prince, one announcing the elevation of Catharine to the throne. Peter died a few days after in prison. The accusation against Catharine of having contributed to hasten this event is without foundation. The young, ambitious princess, neglected by her husband, whom she did not respect, remained passive on the occasion, yielded to circumstances, which were, it is true, propitious to her, and consoled herself for an event which she could not remedy. She knew how to gain the affections of the people by flattering their vanity; showed great respect for their religion; caused herself to be crowned at Moscow with great pomp; devoted herself to the promotion of agriculture and commerce, and the creation of a naval force; improved the laws; and showed the greatest activity in

the administration of the internal as well as the external affairs of Russia. A year after her ascension to the throne she forced the Courlanders to displace their new Duke, Charles of Saxony, and to recall Biren, who was extremely odious to the nobles. After the death of Augustus III., king of Poland, she was the means of Stanislaus Poniatowski's being crowned at Warsaw. But while she was forcing this king on the Poles, the number of the malcontents in her own empire increased, and several attempts against her life were made at St. Petersburg and Moscow. The young Ivan was the person to whom the hopes of the conspirators were directed; but his sudden death at the fortress of Schlüsselburg overthrew the plans of the disaffected. After this the court of the empress was only disturbed from time to time by intrigues, in which gallantry and politics went hand in hand, and which had no other object than to replace one favorite by another. In the midst of pleasure and dissipation Catharine did not neglect the improvement of the laws. Deputies from all the provinces met at Moscow. The empress had herself prepared instructions for their conduct, which were read at the first session; but it was impossible for so many different nations to understand each other, or to be subject to the same laws. Catharine, who presided at the debates, and received from the assembly the title of mother of the country, soon dismissed the discordant legislators. About this time France formed a party in Poland against Russia; but these attempts only served to accelerate Catharine's plans. The war to which the Porte was instigated had the same result. The Turks were beaten. The Russian flag was victorious on the Greek seas; and on the banks of the Neva the plan was formed of re-establishing the republics of Sparta and Athens as a check to the Ottoman power. The advancement of Austrian troops into Poland inspired Catharine with the desire to aggrandize herself in this quarter. She therefore entered into an agreement for the division of the country with the courts of Berlin and Vienna in 1772, by which the governments of Polotzk and Mohilev fell to her share, and she insured to herself exclusive influence in Poland by undertaking to guarantee the Polish constitution. At the same time she abandoned all her conquests, with the exception of Azoph, Taganrog, and Kinburn, in the peace with the Porte, concluded at Kainardschi in 1774, but secured to herself the free navigation of the Black Sea, and stipulated for the independence of the Crimea. By this apparent independence the Crimea, became, in fact, dependent on Catharine. This peace was as opportune as it was advantageous to Russia; for in the third year of the war Moscow and several other cities were desolated by the plague; and about the same time an adventurer named Pugatscheff, assuming the name of Peter III., had excited a revolt in several provinces of eastern Russia, which was soon suppressed. At this time Potemkin exercised an unlimited influence over the empress. In 1784 he succeeded in conquering the Crimea, to which he gave its ancient name of Tauris, and extended the confines of Russia to the Caucasus. Catharine upon this traversed the provinces which had revolted under Pugatscheff, and navigated the Volga and Dnieper, taking greater interest in the expedition, as it

CATHARINE HOWARD — CATHARINE OF ARAGON

was attended with some danger. She was desirous, likewise, of seeing Tauris. Potemkin turned this journey, which took place in 1787, into a triumphal march. Throughout a distance of nearly 1,000 leagues nothing but feasts and spectacles of various kinds were to be seen. Palaces were raised on barren heaths, to be inhabited for a day. Villages and towns were built in the wildernesses, where a short time before the Tartars had fed their herds. An immense population appeared at every step — the picture of affluence and prosperity. A hundred different nations paid homage to their sovereign. Catharine saw, at a distance, towns and villages, of which only the outward walls existed. She was surrounded by a multitude of people, who were conveyed on during the night, to afford her the same spectacle the following day. Two sovereigns visited her on her journey — the king of Poland, Stanislaus Augustus, and the Emperor Joseph II. The latter renewed his promise, given at St. Petersburg, to assist her in her projects against the Turks. The result was a new Turkish war, which by the Peace of Jassy (1792), ended not less favorably for Russia than the first. The power of Russia was also increased by the war with Sweden which terminated in 1790, and by the last two partitions of Poland and the incorporation of Courland. Catharine took no part in the war against France, though she broke off all connection with the French republic, actively assisted the emigrants, and entered into an alliance with England against France. She likewise made war against Persia, and, as some historians assure us, entertained the project of destroying the power of the English in Bengal, when a fit of apoplexy put an end to her life.

Catharine II. has been equally censured and praised. With all the weakness of her sex, and with a love of pleasure carried to licentiousness, she combined the firmness and talent of a powerful sovereign. Two passions were predominant with her until her death, love and ambition. She was never without her favorite, yet she never lost sight of her dignity. She was distinguished for activity, working with her ministers, writing letters to Voltaire and Diderot, and signing an order to attack the Turks, or to occupy Poland, in the same breath. She favored distinguished authors, and was particularly partial to the French. At Paris she had a literary agent (Baron Grimm). She several times invited Voltaire to her court, proposed to D'Alembert to finish the 'Encyclopædia' at St. Petersburg, and to undertake the education of the grand-duke. Diderot visited her at her request, and she often allowed him the privilege of familiar conversation with her. By these means she gained the favor of the literati of Europe, who called her the greatest of rulers; and, in fact, she was not without claims to this title. She protected commerce, improved the laws, dug canals, founded towns, hospitals, and colleges. Pallas and others traveled at her expense. She endeavored to put a stop to the abuses which had crept into the administration of the different departments of government; but she began without being able to finish. Civilization advanced but slowly in Russia under her reign; and her anxiety to enlighten her subjects ceased when she began to entertain the idea that the French Revolution

had been brought about by the progress of civilization. Laws, colonies, schools, manufactures, hospitals, canals, towns, fortifications, everything was commenced, but frequently left unfinished for want of means. See Tooke, 'History of Catharine II.' (1803); Castara, 'Vie de Catherine II.' (1796); Tannenbergh, 'Leben Catherinens II.' (1797); Herzen, 'Mémoires de l'Impératrice Catharine II.' (1859).

Catharine Howard, Queen of England.
See HOWARD, CATHARINE.

Catharine Parr. See PARR, CATHARINE.

Catharine Paulowna, pow-lōf'na, Queen of Wurtemberg: b. 21 May 1788; d. 9 Jan. 1819. She was a daughter of Paul I. of Russia, and in 1809 married George, Duke of Holstein Oldenburg. After his death in 1812, she accompanied her brother, Alexander, on his campaigns in Germany and France (1813-14), to Paris, London, and the congress of Vienna (1815), assisting him by her talents and resolute spirit. The marriage of her younger sister to the Prince of Orange is said to have been effected by her influence. In 1816 she married William, Crown Prince of Wurtemberg, whose acquaintance she had made during her travels. During the famine of 1816 in that country she proved her benevolence by the formation of female associations and an agricultural society. She was active in promoting the education of the people.

Catharine of Ar'agon, Queen of England, the youngest daughter of Ferdinand of Aragon and Isabella of Castile: b. Alcalá de Henares, Spain, 15 Dec. 1485; d. Kimbolton, Huntingdonshire, 7 Jan. 1536. In 1501 she was married to Arthur, Prince of Wales, son of Henry VII. Her husband dying about five months after, the king, unwilling to return her dowry, caused her to be contracted to his remaining son, Henry, and a dispensation was procured from the Pope for that purpose. In his 15th year the Prince made a public protest against the marriage; but at length yielding to the representations of his council, he consented to ratify the contract, and on his accession to the throne in 1509 was crowned with her. The inequality of their ages and the capricious disposition of Henry were circumstances very adverse to the durability of their union, and it seems surprising that Catharine should have acquired and retained an ascendancy over the affections of the king for nearly 20 years. The want of male issue, however, proved a source of disquietude to him, and scruples, real or pretended, at length arose in his mind concerning the legality of their union, which were greatly enforced by a growing passion for Anne Boleyn, one of the queen's maids of honor. He made application to Rome for a divorce from Catharine. But all that Henry could obtain at Rome was a promise to investigate the case. Catharine, meanwhile, conducted herself with gentleness and firmness, and could not in any way be induced to consent to an act which would render her daughter illegitimate, and stain her with the imputation of incest. Being cited before the papal legates, Cardinals Wolsey and Campeggio, in 1529, she declared that she would not submit her cause to their

CATHARINE OF BRAGANZA — CATHARINE DE MEDICI

judgment, but appealed to the court of Rome; which declaration was declared contumacious. His failure to secure the sanction of the Pope to the divorce induced the king to decide the affair for himself; and the condemnation of his conduct expressed on this occasion by the court of Rome provoked him to throw off his submission to it, and declare himself head of the English Church—an act of royal caprice more important than most in history. In 1532 he married Anne Boleyn; upon which Catharine, no longer considered queen of England, retired to Amptill in Bedfordshire. Cranmer, now raised to the primacy, pronounced the sentence of divorce, notwithstanding which Catharine still persisted in maintaining her claims. Shortly before her death she wrote a letter to the king, recommending their daughter (afterward Queen Mary) to his protection, praying for the salvation of his soul, and assuring him of her forgiveness and unabated affection. The pathos of this epistle is said to have drawn tears from Henry. He had never presumed to call the virtues of his injured wife in question, and she certainly acted throughout with eminent dignity and consistency. Several devotional treatises have been attributed to Catharine which belong to Queen Catharine Parr.

Catharine of Braganza, brā-gānzā, wife of Charles II., king of England, and daughter of John IV., king of Portugal: b. Villa Viçosa, Portugal, 25 Nov. 1638; d. Portugal 31 Dec. 1705. In 1662 she married Charles II., in whose court she long endured all the neglect and mortification to which his dissolute conduct necessarily exposed her, and which became still more galling from her having no children; still she conducted herself with great equanimity, and after the death of Charles, received much attention and respect. In 1693 she returned to Portugal, where, in 1704, she was made regent by her brother, Don Pedro, whose increasing infirmities rendered retirement necessary. In this situation Catharine showed considerable abilities, carrying on the war against Spain with great firmness and success.

Catharine of France. See CATHARINE OF VALOIS.

Catharine de Medici, dā mā'dā-chē, Queen of France: b. Florence 1519; d. Blois, France, 5 Jan. 1589. She was the only daughter of Lorenzo de Medici, Duke of Urbino, and the niece of Pope Clement VII. Francis I. consented that his son, Henry, should marry her only because he did not believe she ever would ascend the throne, and because he was in great want of money, with which Lorenzo could furnish him. The marriage was celebrated at Mar-seilles in 1533. Catharine was equally gifted with beauty and talents, and had cultivated her taste for the fine arts in Florence; but at the same time imbibed the perverted principles of politics then prevailing in Italy. Catharine's ambition was unbounded. She sacrificed France and her children to the passion for ruling; but she never aimed steadily at one great end, and had no profound views of policy. The situation in which she was placed, on her arrival at the French court, gave her great opportunity to perfect herself in the art of dissimulation. She flattered alike the Duchess d'Etampes, the mistress of the king, and Diana

de Poitiers, the mistress of her own husband, though these two ladies hated each other. From her apparent indifference she might have been supposed inclined to shun the tumult of public affairs; but when the death of Henry II. in 1559 made her mistress of herself, she plunged her children in a whirl of pleasures, partly to enervate them by dissipation, partly from a natural inclination toward prodigality; and in the midst of these extravagances cruel and bloody measures were executed, the memory of which still makes men shudder. Her authority was limited under the reign of Francis II., her eldest son, who, in consequence of his marriage with the unfortunate Mary Stuart, was entirely devoted to the party of the Guises. Jealous of a power she did not exercise, Catharine then decided to favor the Protestants. If it had not been for her patronage, by which the ambition of the chiefs of the Huguenots was stimulated, the conflicting religious opinions in France never would have caused such lasting civil wars. Catharine felt herself embarrassed by this indulgence toward the innovators, when the death of Francis II. placed the reins of government, during the minority of Charles IX., in her hands. Wavering between the Guises on one side, who had put themselves at the head of the Roman Catholics, and Condé and Coligny on the other, who had become very powerful by the aid of the Protestants, she was constantly obliged to resort to intrigues, which failed to procure her as much power as she might easily have gained by openness of conduct. Despised by all parties, but consoled if she could deceive them; taking arms only to treat, and never treating without preparing the materials for a new civil war, she brought Charles IX., when he became of age, into a situation in which he must either make the royal authority subordinate to a powerful party, or cause part of his subjects to be massacred, in the hope, at best a doubtful one, of subduing faction. The massacre of St. Bartholomew was her work. She induced the king to practise a dissimulation foreign to his character; and as often as he evinced a disposition to free himself from a dependence of which he was ashamed, she knew how to prevent him, by the fear and jealousy which she excited in him by favoring his brother Henry. After the death of Charles IX. Catharine became again regent of the kingdom, till the return of Henry III., then king of Poland. She contributed to the many misfortunes of his reign by the measures which she had adopted previously to its commencement, and by the intrigues in which she was uninterruptedly engaged. At her death, France was in a state of complete dismemberment. The religious contests were in reality very indifferent to her. The consequences she was not able to conceive. She was ready to risk life for the gratification of her ambition. She was equally artful in uniting her adherents, and in promoting dissension among her adversaries. To those who directed her attention to the prodigal expenditure of the public treasure, she used to say, "One must live." Her example contributed greatly to promote the corruption of morals which prevailed in her time. Her manners, however, were elegant, and she took a lively interest in the sciences and arts. She procured valuable manuscripts from Greece and Italy, and

CATHARINE OF VALOIS — CATHEDRAL

caused the Tuileries and the Hotel de Soissons to be built. In the provinces, also, several castles were erected by her order, distinguished for the beauty of their architecture, in an age when the principles of the art were still unknown in France. She had two daughters, Elizabeth, married to Philip II. of Spain in 1559, and Margaret of Valois, married to Henry of Navarre, afterward Henry IV. See ALBEN, 'Vita di Caterina di Medici' (1834); La Ferrière, 'Lettres de Catherine de Medicis' (1880-5).

Catharine of Valois, vāl'wā, Queen of England, youngest child of Charles VI. and Isabella of Bavaria: b. Paris 27 Oct. 1401; d. 3 Jan. 1438. In 1420 she was married to Henry V. of England, who was then declared successor to the crown of France. To this prince she bore Henry VI., crowned in his cradle king of both countries. After the death of Henry, in 1422, Catharine privately married Owen Theodore, or Tudor, a Welsh gentleman of small fortune, but descended from the ancient British princes. By this marriage she had two sons, the eldest of whom, Edmund, earl of Richmond, by a marriage with Margaret Beaufort, of the legitimated branch of Lancaster, became father of Henry VII. and founder of the house of Tudor.

Catharine-wheel, a window or compartment of a window of circular form, sometimes with radiating divisions or spokes, used in mediæval buildings, called a rose, or marigold window. It is a memorial of St. Catharine's martyrdom. The term is also applied to a kind of firework in the shape of a wheel, made to revolve automatically when lighted; a pin-wheel.

Cathar'tic, any remedy that will cause an emptying of the intestinal canal. For purposes of general description there are four classes of cathartics. These are mild cathartics, or laxatives; simple purges, drastic purges, and hydragogues. Catharsis is accomplished either by increasing the amount of water in the intestines or by stimulating the movements of the intestines—peristalsis. The laxatives are water, sugar, honey, fruits, stringy vegetables, coarse bread, cassia fistula, sulphur, figs, etc.; these act either by giving bulk, stimulation of peristalsis, or by adding water, all of the sugars attracting water from the intestinal wall. The simple purges act usually by stimulating peristalsis. These are castor oil, cascara sagrada, rhubarb, aloes, senna, iris, podophyllum, leptandra, calomel, etc. The drastic purges stimulate peristalsis, and many of them cause a flow of water into the intestine. The simple purges in large doses are drastic. Gamboge, jalap, colocynth, scammony, croton oil, and elaterium are drastics. Another class of cathartics are salty, and by osmosis attract water into the intestines; they thus act as hydragogues and are termed the saline cathartics. Those most commonly used are epsom salts, rochelle salts, magnesium oxide, citrate, sodium phosphate, tartrate, and bitartrate. Most of the mineral waters belong to this class of cathartic. In former times cholagogues were described as cathartics that "stirred up the liver secretions." It is now fairly well recognized that those drugs that stimulate peristalsis affect the gall bladder, causing it to empty itself more actively, and that the liver is unaffected. The only true hepatic stimulant that is now recognized

is ox-gall. This is frequently employed as a cathartic. Abuse of cathartics is an evil above all description. It is almost safe to assert that the injudicious use of the many patent cathartic pills on the market is responsible for more intestinal trouble than any other agent. They teach people to be careless of their intestinal functions and work incalculable injury. See CONSTIPATION.

Cathartidæ, the American vultures, a family of birds of the order *accipitres* or *Raptores*, differing from the more eagle-like Old World vultures (*I'ulturidæ*) in having the beak comparatively slender, straight, and blunt, the complete absence of a septum between the nostrils, the much more largely naked head and neck, and the weak feet with elevated hallux and little curved claws. Altogether they are less predaceous birds, which feed exclusively on carrion or attack weakling animals. Five genera, each with but one or a few species, are found in America, more especially in the warmer parts. Among them are the carrion crow, the condor, and the turkey buzzard (qq.v.).

Cathay, kâth-ā', a name of which Marco Polo designated a part of Asia, probably north China.

Cath'cart, SIR GEORGE, son of William Shaw Cathcart (q.v.): b. London 12 May 1794; d. Inkerman, Crimea, 5 Nov. 1854. He entered the Life Guards in 1810, accompanied his father as attaché to Russia, and subsequently acted as aide-de-camp to the Duke of Wellington at Waterloo. He served in Nova Scotia and the West Indies, quelled the rebellion in Canada in 1837, and was appointed in 1852 governor at the Cape of Good Hope, where he showed ability in subduing the Kaffir insurrection. On the outbreak of the Crimean war great things were expected of him, but he fell as divisional commander at Inkerman.

Cathcart, William Shaw, EARL OF, English soldier and diplomatist: b. Petersham, England, 17 Sept. 1755; d. near Glasgow 17 June 1843. He studied at Glasgow, then entered the army, and served with distinction first in the American war and afterward in the campaigns against the French republic in Flanders and Germany. In 1801 he was made lieutenant-general, and in 1803 commander-in-chief for Ireland. In 1807 he was appointed commander of the land forces in the expedition against Copenhagen, and was created a viscount for his services on this occasion. In 1812 he proceeded to Russia as minister-pleni-potentiary, joined the Emperor Alexander at the headquarters of the Russian army, and accompanied him through the campaigns of 1813-14. He entered Paris with the allied sovereigns, and was present at the Congress of Vienna. The same year he was created an earl. Subsequent to this he resided for several years at St. Petersburg as ambassador to the Russian court.

Cathe'dral (Lat. *cathedra*, a "seat." Thus, "to speak ex cathedra," is to speak as from a seat of authority). A cathedral city is the seat of the bishop of the diocese, and his throne is placed in the cathedral church. From the early times of the Christian Church the bishop presided in the presbytery or the assembly of priests. He was seated on a chair, a little higher than that of the others. The whole meeting of priests was called *cathedra*; and at a later period,

when Christians were allowed to build churches, this name was applied to the episcopal churches, and the name *basilica* to the particular churches erected in honor of a saint or a martyr. The distinction between cathedral and collegiate churches consists principally in the see of the bishop being at the former. The governing body of a cathedral is called the dean and chapter. The cathedral is commonly, though not invariably, the most important church building, architecturally speaking, in the diocese. Its usual form is a Latin or Greek cross, and from the comparatively simple outline of the early Christian basilica has been evolved in time the complex cathedral structure of the Middle Ages. In its outline a typical cathedral exhibits nave with north and south aisles, transepts with eastern and western aisles, choir with aisles north and south, retro-choir, and eastern Lady Chapel, a lantern tower at the crossing and two towers flanking the west end of the nave. French cathedrals are distinguished by their great height, chevets, or apsidal east ends with a corona of chapels, elaborate and logical vaulting system, and, in the later Gothic styles, by extremely profuse adornment. The portals of French churches generally are lofty and imposing and richly sculptured. English cathedrals are much longer and lower than French ones, their east ends are usually square and their portals small, and, as at Wells, even insignificant.

The Church of St. John of Lateran, at Rome, founded by Constantine, is the Episcopal church or cathedral of the Pope, and bears over its chief portal the inscription, *Omnium urbis et orbis ecclesiarum mater et caput*, "mother and head of all the churches of Rome and the world." At its chief altar none but the Pope can read mass, for it covers another ancient altar at which the apostle Peter is said to have officiated. The basilica of St. Peter's at Rome may be mentioned as surpassed by no cathedral in antiquity and splendor, and equaled by none in magnitude. The length of the interior is 613½ feet, width at transept 446½ feet, height of nave 153 feet. The cathedral at Cologne was begun in the middle of the 13th century, and only partly finished in 1509, after which work was not resumed on it till 1830. In 1863 the interior was thrown open to the public. In 1880 it was finished. The structure is 511 feet long and 231 feet wide. The towers are 501 feet high. The cathedral of Dantzic was commenced in 1343 and finished in 1503. Its length is 358 feet and its height 230 feet. Notre Dame, Antwerp, was begun toward the close of the 14th century; its length is 390 feet and its width 250 feet. The cathedral at Rheims was begun in 1211 and finished in 1430. It is 466 feet long. The cathedral at Amiens dates from 1220, and is 469 feet long, with a central spire 422 feet high. The cathedral at Strasbourg was completed in 1601, and is one of the grandest Gothic structures in Europe. Its spire is 466 feet high. Notre Dame, Paris, was begun about 1163. Its length is 390 feet, width of transept 144 feet, height of vaulting 105 feet, of western towers 224 feet, width of front 128 feet, and length of nave to transept 186 feet. Salisbury Cathedral, England, founded 1220, finished in 1258, is a fine specimen. Its plan is a double cross, in extreme length, 474 feet, width of greater transept, 230 feet. Canterbury Cathedral, founded shortly after the

Conquest, is 545 feet long and the greater transept, 170 feet. It has three towers, the central one being 230 feet high. The crypts, which extend under the whole structure, are the finest in England. Ely Cathedral is 516 feet long and 190 feet wide. Lincoln Cathedral is 524 feet long outside and 482 inside. The central tower is 300 feet high. The cathedral at York is 524 feet long, 250 feet wide, and has a superb central tower. The nave is 264 feet long, 106 feet wide, and 93 feet high. St. Paul's, London (the present edifice, the first having been destroyed in the great fire of 1666), was begun in 1675, and finished in 1710. It is built in the form of a Latin cross, and is 514 feet in length. The transept is 286 feet long, and the west front 180 feet wide. The campanile towers at the west end are each 222 feet in height. The dome is 365 feet from the ground, 356 feet from the floor of the building, 145 feet in diameter, and 404 feet from the ground to the top of the cross. The Cathedral of St. Peter and St. Paul, Philadelphia, has a dome 210 feet high. At Baltimore the Roman Catholic Cathedral is 190 feet long, 177 feet wide, and 127 feet high to the top of the cross. St. Patrick's Cathedral, New York, is 332 feet long and 132 feet in general width, with an extreme width at the transept of 174 feet. It has two tall spires at the west end and is designed after the most elaborate examples of French Gothic. The Cathedral of Notre Dame, Montreal, Canada, is 255 feet long, 135 feet wide, and has two towers, each 220 feet high. The Cathedral of Mexico was begun in 1573, and was finished in 1667. It is 500 feet long and 420 feet wide. The cathedral of Lima is 320 feet long and 180 feet wide. The cathedral of St. John the Divine (Protestant Episcopal) in New York, will, when completed, be the most ambitious structure of the kind on this continent. The cathedrals of Glasgow and Kirkwall are the only complete and entire cathedrals in Scotland, exclusive of modern edifices so called. See Addis, 'Cathedrals of Scotland'; Bell, 'Cathedral Series'; Bell, 'Handbooks to Continental Churches'; Bond, 'English Cathedrals'; Gilchrist and Perkins, 'Itinerary of English Cathedrals'; Van Rensselaer, 'English Cathedrals'; Wilson, 'Cathedrals of France.'

Cathe'dral, The, a poem by James Russell Lowell. The particular cathedral which suggested the thought of the poem is that of Chartres.

Cathedral Peak, a peak of the Sierra Nevada range, situated in Mariposa County, Cal. It is of granite formation and contains the source of the Merced River. It is 11,000 feet high.

Cathelineau, Jacques, zhāk kā-tē-lē-nō, French Vendean general: b. Pin-en-Mauge, Anjou, 5 Jan. 1759; d. 11 July 1793. On the breaking out of the French Revolution he was living quietly with his family, when an unforeseen event suddenly called him forth from obscurity. In March 1793, during the levy of the conscription which the national assembly had decreed, the youth of the district of St. Florent rose in insurrection, and put the officials and *gens d'armes* to flight. They then returned home, and were awaiting the terrible revenge of the Republicans, when news of the outbreak reached

CATHERINE—CATHOLIC APOSTOLIC CHURCH

Cathelineau. He instantly determined to put himself at the head of his countrymen. Causing the alarm-bell to be rung in different places, he was soon followed by almost all the men capable of bearing arms, surprised several republican posts, carried off their cannon, and now mustered several thousand strong. As he did not deem himself equal to the post of commander, he placed himself under Bonchamp and Elbée, but after the victory of Saumur, 9 June 1793, was formally invested as commander-in-chief. On this he resolved to make a decisive attack on Nantes, and appeared before it with 80,000 men, still further increased by 30,000, whom Charette brought from lower Poitou. Notwithstanding these vast numbers, and the greatest display of undisciplined gallantry, the attack was repulsed, and Cathelineau died shortly after of the severe wounds which he had received.

Cath'érine. See CATHARINE.

Catherine Harbor, Russia, a port in the northwestern part of the empire on the Murman coast of the Kola peninsula. It was formally opened in 1900, the city having been built by imperial command. It is primarily a naval station, the harbor being a mile and a half long, 1,600 feet wide, and 70 to 160 feet deep. The port is ice free.

Cath'érine's, St., or **Santa Catharina,** an island close to the coast of Brazil, between lat. 27° and 28° S., and belonging to the province or state of Santa Catharina. It is 37 miles long and 10 broad, and contains Desterro, the state capital.

Cath'erwood, Mary Hartwell, American novelist: b. Luray, Ohio, 16 Dec. 1847; d. Chicago, Ill., 26 Dec. 1902. She was graduated from the Female College, Granville, Ohio, in 1868 and was married to John Steele Catherwood in 1887. Her especial field was the romance of American history and her writings include 'Old Caravan Days'; 'Craque-o'-Doom' (1881); 'The Romance of Dollard' (1889); 'The Story of Tonty' (1890); 'A Woman in Armor'; 'The Lady of Fort St. John' (1891); 'The Chase of St. Castin, and Other Tales' (1894); 'The Spirit of an Illinois Town' (1897); 'The White Islander'; 'Old Kaskaskia' (1893); 'The Days of Jeanne d'Arc'; 'Bony and Ban'; 'Mackinac and Lake Stories'; 'Spanish Peggy'; 'Lazare' (1902).

. **Cath'eter,** any tubular organ used to insert into a mucous canal or hollow organ. Thus, there are nasal catheters for the nose, eustachian catheters for the internal ear, urinary catheters for the bladder. This latter is the more frequently used. Great care should be exercised in its use, that it be kept clean, to avoid cystitis (q.v.).

Cathetometer, in physics, an instrument for the exact measurement of small vertical distances. In its usual form it consists of a horizontal telescope, mounted so as to slide upon a fixed, graduated, upright support or post. The telescope is raised or lowered until its cross-hairs coincide with one of the objects whose difference in height is to be determined, and the position of the telescope upon the vertical, graduated post is noted by means of a vernier or micrometer. The telescope is then brought

to the elevation of the second object in the same way, and the difference in the two readings gives the desired difference in height. A cathetometer that is well designed and constructed is an instrument capable of giving very precise results when in the hands of a skilful observer. It is greatly used in accurate barometry, for determining the height of the barometric column above the mercury in the cistern.

Cath'ode, that part of a galvanic battery by which the electric current leaves substances through which it has passed, or the surface at which the electric current passes out of the electrolyte; the negative pole.

Cathode Rays. See ETHER; MOLECULAR THEORY; RADIATION; etc.

Catholic Apostolic Church, a body of Christian believers which arose in Great Britain in 1835, consisting at first of the members of a congregation of a Scotch Presbyterian Church in London and their pastor, Edward Irving (q.v.), who separated themselves from that communion and effected a new church organization under the above name. They are also commonly designated as Irvingites. They regarded the gifts or *charismata*, which were divinely bestowed upon the first Christians—"the word of wisdom, gifts of healing, workings of miracles, prophecy, discernings of spirits, divers kinds of tongues, interpretation of tongues"—and the phenomena witnessed at the assembly of the faithful when the Spirit descended upon the 11 apostles, not as extraordinary and pertaining to the Church in that time only, but as the normal manifestations of the presence of the Spirit in the assembly of the believers when they have a living faith. The little flock were confirmed in their belief by reports of occurrences in many respects like those of which the apostle Paul speaks in his first letter to the church of Corinth, quoted above—reports which were vouched for as simply true by some members of Mr. Irving's congregation who made an investigation of the phenomena. The scene of these manifestations was a meeting-house at Port Glasgow, Scotland. The gifts displayed were those of "tongues" and "prophesying." The governing body of the Scotch Presbyterian Church deposed Mr. Irving from the ministry, and shortly afterward he died. But his people persisted in their beliefs, and laid the broad foundations of the Catholic Apostolic Church. It has 4 ministries: apostles, prophets, evangelists, and pastors, each comprising 12 members. These 48 preside over the "12 tribes" of the universal Church. Each congregation, normally numbering 500 adult communicants, has its "angel" or bishop, under whom are 24 priests, 6 of each of the 4 orders or ministries of apostles, prophets, evangelists, and pastors, besides elders, deacons for the temporal affairs, and a corps of subdeacons, acolytes, singers, and doorkeepers. In the daily religious services at 6 and 9 A.M., and 3 and 5 P.M., the "low celebration," the matins, the vespers, the "proposition" of the sacrament; the "high celebration" at 10 A.M. Sundays at the "high altar"; the use of vestments, lights, incense, holy oil, etc., in all these respects the Catholic Apostolic Church aims at as pronounced a ritualism as is seen in a Cath-

CATHOLIC BENEVOLENT LEGION — CATHOLIC CHURCH

olic cathedral. The ministry with their coadjutors are supported by tithes contributed by the faithful. The Catholic Apostolic Church has spread abroad widely, claiming to have organizations in Germany, France, Switzerland, Belgium, Russia, Denmark, Sweden, Australia, India, Ireland, and the United States. The statistics of religions compiled for the New York 'Independent' in 1902 show that then it had in the United States, 95 ministers, 10 churches, and 1,394 communicants.

Catholic Benevolent Legion, a fraternal society for Roman Catholic laymen, designed to afford to the members facilities for intellectual improvement, social advancement, and such other advantages as are offered by similar non-Catholic fraternities. It was organized in 1881 and incorporated under the laws of the State of New York with 11 charter members. Twenty years later the society had 50,000 active members, and had paid to widows and orphans of 6,200 deceased members the sum of \$12,000,000. The organization is incorporated under the style of The Supreme Council, Catholic Benevolent Legion, and to the Supreme Council final appeal is made on all matters of importance emanating from State or subordinate councils. Male Roman Catholics who are personally acceptable, of sound bodily health, and between the ages of 18 and 55, are alone eligible to membership. There is a relief fund on behalf of sick and distressed members, and a benefit fund, out of which a sum not exceeding \$5,000 is paid to the beneficiaries of deceased members, and a sum not exceeding \$2,500 to a member who is permanently disabled. A subordinate council of the Catholic Benevolent Legion may be formed in any congregation or parish; a charter is granted by the Supreme Council to a group of 15 or even of 7 eligible persons who associate themselves with a view to enter the fraternity. The organization has the express approval of the Pontiff and of all the archbishops and bishops in whose jurisdictions councils of the fraternity have been formed.

Catholic Church, a phrase signifying the universal Church, the whole body of true believers in Christ; but the term is often used as equivalent to the Roman or Western Church. Like most other words used in ecclesiology, the term Catholic was borrowed at first from the New Testament. It occurs in some editions of the Greek original—including that issued in connection with the last revision—in the titles prefixed to the Epistles of James, 1 and 2 Peter, 1 John, and Jude, and is the word translated "general" in the King James Bible. The first to apply it to the Church was the Apostolic Father Ignatius. When he and his successors used it they meant to indicate that the Church of which they constituted a part, comprised the main body of believers, and was designed, as it was entitled, to be universal. In this sense the Church was opposed to the sects and separate bodies of heretics who had separated themselves from it and were now outside its pale. When, in the 8th century, the separation between the Eastern and Western Churches took place, the latter retained as one of its appellations the term "Catholic," the Eastern Church being contented with the word "Orthodox," still used by the Russian emperors in their politico-ecclesiastical mani-

festos. When the Protestant churches separated from their communion with Rome in the 16th century, those whom they had left naturally regarded them as outside the Catholic pale. They, on the other hand, declined to admit that this was the case, and the term "Catholic Church" is used in the English Liturgy apparently in the sense of all persons making a Christian profession.

Catholic Church, Beneficent Effects of The. We live and move and have our being in the midst of a civilization which is the legitimate offspring of the Catholic religion. The blessings resulting from our Christian civilization are poured out so regularly and so abundantly on the intellectual, moral and social world, like the sunlight and the air of heaven and the fruits of the earth that they have ceased to excite any surprise except to those who visit lands where the religion of Christ is little known. In order to realize adequately our favored situation we should transport ourselves in spirit to ante-Christian times and contrast the condition of the pagan world with our own. Before the advent of Christ, the whole world, with the exception of the secluded Roman province of Palestine, was buried in idolatry. Every striking object in nature had its tutelary divinities. Men worshipped the sun and moon and stars of heaven. They worshipped their very passions. They worshipped everything except God only, to whom alone divine homage is due. In the words of the Apostle of the Gentiles, "They changed the glory of the incorruptible God into the likeness of corruptible man, and of birds and beasts and creeping things. They worshipped and served the creature rather than the Creator who is blessed forever."

But at last the great Light for which the prophets of Israel had sighed and prayed, and toward which even the pagan sages had stretched forth their hands with eager longing, arose and shone unto them "that sat in darkness and in the shadow of death." The truth concerning our Creator, which had hitherto been hidden in Judea, that there it might be sheltered from the world-wide idolatry, was now proclaimed, and in far greater clearness and fullness, unto the whole world. Jesus Christ taught all mankind to know the one true God, a God existing from eternity unto eternity, a God who created all things by his power, who governs all things by his wisdom, and whose superintending providence watches over the affairs of nations as well as of men, "without whom not even a bird falls to the ground." He proclaimed a God infinitely holy, just, and merciful. This idea of the Deity, so consonant to our rational conceptions, was in striking contrast with the low and sensual notions which the pagan world had formed of its divinities. The religion of Christ imparts to us not only a sublime conception of God, but also a rational idea of man and of his relations to his Creator. Before the coming of Christ, man was a riddle and a mystery to himself. He knew not whence he came or whither he was going. He was groping in the dark. All he knew for certain was that he was passing through a brief phase of existence. The past and the future were enveloped in a mist which the light of philosophy was unable to penetrate. Our Redeemer has dis-

CATHOLIC CHURCH

pelled the cloud and enlightened us regarding our origin and destiny and the means of attaining it. He has rescued man from the frightful labyrinth of error in which paganism had involved him.

The Gospel of Christ as propounded by the Catholic Church has brought not only light to the intellect, but comfort also to the heart. It has given us "that peace of God which surpasseth all understanding," the peace which springs from the conscious possession of the truth. It has taught us how to enjoy that triple peace which constitutes true happiness as far as it is attainable in this life; peace with God by the observance of his commandments, peace with our neighbor by the exercise of justice and charity toward him, and peace with ourselves by repressing our inordinate appetites, and by keeping our passions subject to the law of reason, and our reason illumined and controlled by the law of God.

All other religious systems prior to the advent of Christ were national like Judaism, or state religions like paganism. The Catholic religion alone is world-wide and cosmopolitan, embracing all races and nations and peoples and tongues. Christ alone, of all religious founders, had the courage to say to his disciples, "Go teach all nations; preach the gospel to every creature. You shall be witnesses unto me in Judea and Samaria and even to the uttermost bounds of the earth. Be not restrained in your mission by national or state lines; let my gospel be as free and universal as the air of heaven. The earth is the Lord's and the fullness thereof. All mankind are the children of my Father and are my brethren. I have died for all, and embrace all in my charity. Let the whole human race be your audience and the world be the theatre of your labors."

It is this recognition of the fatherhood of God and the brotherhood of Christ that has inspired the Catholic Church in her mission of love and benevolence. This is the secret of her all-pervading charity. This idea has been her impelling motive in her work of the social regeneration of mankind. I behold, she says, in every human creature, a child of God and a brother or sister of Christ and therefore I will protect helpless infancy and decrepit old age. I will feed the orphan and nurse the sick. I will strike the shackles from the feet of the slave and will rescue degraded woman from the moral bondage and degradation to which her own frailty and the passions of the stronger sex had consigned her. Montesquieu has well said that the religion of Christ, which was instituted to lead men to eternal life, has contributed more than any other institution to promote the temporal and social happiness of mankind. Let us briefly review what the Catholic Church has done for the elevation and betterment of society.

1. The Catholic Church has purified society in its very fountain, which is the marriage bond. She has invariably proclaimed the unity and sanctity and indissolubility of the marriage tie by saying with her founder, "What God hath joined together, let no man put asunder." Wives and mothers should never forget that the inviolability of the marriage contract is the palladium of their womanly dignity and their Christian liberty. And if they are no longer the slaves of man and the toy of his caprice, like wives

in Asiatic countries, but the peers and partners of their husbands; if they are no longer tenants at will like the wives of pagan Greece and Rome, but the mistresses of the household; if they are no longer confronted by usurping rivals like Mohammedan and Mormon wives, but the queens of the domestic kingdom, they are indebted for this priceless boon to the ancient Church, and particularly to the Roman pontiffs, who inflexibly upheld the sacredness of the nuptial bond against the arbitrary power of kings, the lust of nobles, and the lax and pernicious legislation of civil government.

2. The Catholic religion has proclaimed the sanctity of human life as soon as the body is animated by the vital spark. Infanticide was a dark stain in pagan civilization. It was universal in Greece with the possible exception of Thebes. It was sanctioned and even sometimes enjoined by such eminent Greeks as Plato and Aristotle, Solon and Lycurgus. The destruction of infants was also very common among the Romans. Nor was there any legal check to this inhuman crime except at rare intervals. The father had the power of life and death over his child. And as an evidence that human nature does not improve with time, and is everywhere the same unless it is fermented with the leaven of Christianity, the wanton sacrifice of infant life is probably as general to-day in China and other heathen countries as it was in ancient Greece and Rome. The Catholic Church has sternly set her face against this exposure and murder of innocent babes. She has denounced it as a crime more revolting than that of Herod, because committed against one's own flesh and blood. She has condemned with equal energy the atrocious doctrine of Malthus, who suggested unnatural methods for diminishing the population of the human family. Were I not restrained by the fear of offending modesty, and of imparting knowledge where "ignorance is bliss," I would dwell more at length on the social plague of ante-natal infanticide, which is insidiously and systematically spreading among us in defiance of civil penalties and of the divine law which says "Thou shalt not kill."

3. There is no phase of human misery for which the Church does not provide some remedy or alleviation. She has established infant asylums for the shelter of helpless babes who have been cruelly abandoned by their own parents, or bereft of them in the mysterious dispensation of Providence before they could know and feel a mother's love. These little waifs, like the infant Moses drifting on the turbid Nile, are rescued from an untimely death, and are tenderly raised by the daughters of the great King, those consecrated virgins who become nursing mothers to them. And I have known more than one such motherless babe, who like Israel's lawgiver, in after years became a leader among his people.

4. As the Church provides homes for those yet on the threshold of life, so too does she secure retreats for those on the threshold of death. She has asylums in which the aged, men and women, find at one and the same time a refuge in their old age from the storms of life, and a novitiate to prepare them for eternity. Thus, from the cradle to the grave she is a loving mother. She rocks her children in the cradle of infancy, and she soothes them to rest on the couch of death.

CATHOLIC CHURCH

Louis XIV. erected in Paris the famous *Hôtel des Invalides* for the veteran soldiers of France who had fought in the service of their country. And so has the Catholic religion provided for those who have been disabled in the battle of life, a home in which they are tenderly nursed in their declining years by devoted sisters. The Little Sisters of the Poor, whose congregation was founded in 1840, have now charge of 250 establishments in different parts of the globe, the aged inmates of those houses numbering 30,000, and upward of 70,000 having died under their care up to 1889. To these asylums are welcomed not only the members of the Catholic religion, but those also of every form of Christian faith, and even those without any faith at all. The sisters make no distinction of person or nationality or color or creed; for true charity embraces all. The only question proposed by the sisters to the applicant for shelter is this: "Are you oppressed by age and penury? If so, come to us and we will provide for you."

5. She has orphan asylums where children of both sexes are reared and taught to become useful and worthy members of society.

6. Hospitals were unknown to the pagan world before the coming of Christ; the copious vocabularies of Greece and Rome had no word even to express that term. The Catholic Church has hospitals for the treatment and care of every form of disease. She sends her daughters of charity and of mercy to the battlefield and to the plague-stricken city. During the Crimean war I remember to have read of a sister who was struck dead by a ball while she was in the act of stooping down and bandaging the wound of a fallen soldier. Much praise was then deservedly bestowed on Florence Nightingale for her devotion to the sick and wounded soldiers. Her name resounded in both hemispheres. But in every sister you have a Florence Nightingale with this difference, that like ministering angels they move without noise along the path of duty, and like the angel Raphael, who concealed his name from Tobias, the sister hides her name from the world.

Several years ago I accompanied to New Orleans eight sisters of charity who were sent from Baltimore to reinforce the ranks of their heroic companions or to supply the places of their devoted associates who had fallen at the post of duty in the fever-stricken cities of the South. Their departure for the scene of their labors was neither announced by the press nor heralded by public applause. They rushed calmly into the jaws of death, not bent on deeds of destruction like the famous "six hundred," but on deeds of mercy. They had no Tennyson to sound their praises. Their only ambition was—and how lofty is that ambition!—that the recording angel might be their biographer, that their names might be inscribed in the Book of Life, and that they might receive their recompense from him who has said: "I was sick and ye visited me; for as often as ye did it to one of the least of my brethren, ye did it to me." Within a few months after their arrival, six of the eight sisters died victims of the epidemic.

These are a few of the many instances of heroic charity that have fallen under my own observation. Here are examples of sublime heroism not culled from the musty pages of

ancient martyrologies, or of books of chivalry, but happening in our own day and under our own eyes. Here is a heroism not aroused by the emulation of brave comrades on the battlefield, nor by the clash of arms or the strains of martial hymns, nor by the love of earthly fame, but inspired only by a sense of Christian duty and by the love of God and of fellow beings.

7. The Catholic religion labors not only to assuage the physical distempers of humanity, but also to reclaim the victims of moral disease. The redemption of fallen women from a life of infamy was never included in the scope of heathen philanthropy, and man's unregenerate nature is the same now as before the birth of Christ. He worships woman as long as she has charms to fascinate; but she is spurned and trampled upon as soon as she has ceased to please. It was reserved for him who knew no sin to throw the mantle of protection over sinning woman. There is no page in the gospels more touching than that which records our Saviour's merciful judgment on the adulterous woman. The scribes and Pharisees, who had perhaps participated in her guilt, asked our Lord to pronounce sentence of death upon her in accordance with the Mosaic law. "Hath no one condemned thee?" asked our Saviour. "No one, Lord," she answered. "Then," said he, "neither will I condemn thee. Go, sin no more." Inspired by this divine example, the Catholic Church shelters erring females in homes not inappropriately called *Magdalen asylums* and houses of the Good Shepherd. Not to speak of other institutions established for the moral reformation of women, the Congregation of the Good Shepherd at Angers, founded in 1836, has charge to-day of 150 houses, in which upward of 4,000 sisters devote themselves to the care of over 20,000 females who had yielded to temptation, or were rescued from impending danger.

8. The Christian religion has been the unvarying friend and advocate of the bondman. Before the dawn of Christianity, slavery was universal in civilized as well as in barbarous nations. The apostles were everywhere confronted by the children of oppression. Their first task was to mitigate the horrors and alleviate the miseries of human bondage. They cheered the slave by holding up to him the example of Christ, who voluntarily became a slave that we might enjoy the glorious liberty of children of God. The bondman has an equal participation with his master in the sacraments of the Church, and in the priceless consolation which religion affords. Slave-owners were admonished to be kind and humane to their slaves by being reminded with apostolic freedom that they and their servants had the same Master in heaven who had no respect of person. The ministers of the Catholic religion down the ages sought to lighten the burden and improve the condition of the slaves, as far as social prejudices would permit, till at length the chains fell from their feet. Human slavery has at last, thank God, melted away before the noonday sun of the gospel. No Christian country contains to-day a solitary slave. To paraphrase the words of a distinguished Irish jurist: As soon as the bondman puts his feet on a Christian land, he stands redeemed, regenerated, and disenthralled on the sacred soil of Christendom.

CATHOLIC CHURCH

9. The Saviour of mankind never conferred a greater temporal boon on humanity than by ennobling and sanctifying manual labor, and by rescuing it from the stigma of degradation which had been branded upon it. Before Christ appeared among men, manual and even mechanical work was regarded as servile and degrading to the freeman of pagan Rome, and was consequently relegated to slaves. Christ is ushered into the world not amid the pomp and splendor of imperial majesty, but amid the environments of an humble child of toil. He is the reputed son of an artisan, and his early manhood is spent in a mechanic's shop. "Is not this the carpenter, the son of Mary?" The primeval curse attached to labor is obliterated by the toilsome life of Jesus Christ. Ever since he pursued his trade as a carpenter he has lightened the mechanic's tools and has shed a halo around the workshop.

If the professions of a general, a jurist, and a statesman are adorned, respectively, by the example of a Washington, a Taney, and a Burke, how much more is the calling of a workman ennobled by the example of Christ! What De Tocqueville said 60 years ago of the United States is true to-day, that with us every honest labor is honorable, thanks to the example and teaching of Jesus Christ.

To sum up: The Catholic Church has taught man the knowledge of God and of himself; she has brought comfort to his heart by instructing him to bear the ills of life with Christian philosophy. She has sanctified the marriage bond; she has proclaimed the sanctity and inviolability of human life from the moment that the body is animated by the spark of life till its extinction; she has founded asylums for the training of children of both sexes and for the support of the aged poor. She has established hospitals for the sick and homes for the redemption of fallen women. She has exerted her influence toward the mitigation and abolition of human slavery. She has been the unwavering friend of the sons of toil. These are some of the blessings which the Catholic Church has conferred on society.

I will not deny, on the contrary I am happy to avow, that the various Christian bodies outside the Catholic Church have been and are to-day zealous promoters of most of these works of Christian benevolence which I have enumerated. But will not our separated brethren have the candor to acknowledge that we had first possession of the field, that these beneficent movements have been inaugurated by us, and that the other Christian communities in their noble efforts for the moral and social regeneration of mankind, have in no small measure been stimulated by the example and emulation of the ancient Church?

Let us do all we can in our day and generation in the cause of humanity. Every man has a mission from God to help his fellow being. Though we differ in faith, thank God, there is one platform on which we stand united, and that is the platform of charity and benevolence. We cannot, indeed, like our divine Master, give sight to the blind, and hearing to the deaf, and speech to the dumb, and strength to the paralyzed limb, but we can work miracles of grace and mercy by relieving the distress of our suffering brethren. And never do we approach nearer to our heavenly Father than when we

alleviate the sorrows of others. Never do we perform an act more God-like than when we bring sunshine to hearts that are dark and desolate; never are we more like unto God than when we cause the flower of joy and gladness to bloom in souls that were dry and barren before. "Religion," says the Apostle, "pure and undefiled before God and the Father, is this: to visit the fatherless and the widow in their tribulation, and to keep oneself unspotted from this world." Or to borrow the words of the pagan Cicero: *Homines ad Deos nulla re propius accedunt quam salutem hominibus dando*; ("There is no way by which men can approach nearer to the Gods than by contributing to the welfare of their fellow creatures.")

JAMES CARDINAL GIBBONS.

Catholic Church, Roman. By this name is designated the large body of Christians, united in doctrine and worship under the supreme jurisdiction of the pope, the bishop of Rome. (See PAPACY.) The members of this communion are wont rather to speak of it as the "Catholic Church," but admit the term "Roman" in the sense that "to be Roman is to be Catholic and to be Catholic is to be Roman." They hold that their Church alone possesses in its fulness the system of truths, laws, and practices for the worship of God which was instituted by Jesus Christ (q.v.). Hence a brief statement of Catholic teaching on the origin, nature, and properties of the Church of Christ will enable us to understand why the Roman Catholic Church demands that all men submit to her authority as a teacher, divinely appointed to make known with absolute certainty the conditions of salvation.

From the Four Gospels, considered as trustworthy historical documents, we learn that Jesus Christ was certainly a divine messenger to all mankind, and that therefore all men are bound to receive His message with implicit submission. The doctrine which He teaches may be an enforcement of truths which man might have learned, however imperfectly, by the use of his natural powers, or may include new truths which his natural powers would never have discovered. As Christ did not remain on earth to teach all men in person, He chose a band of apostles, whom He commissioned to preach to all nations the truths He had taught them, promising His assistance unto the end of the world, and imposing upon all men, under penalty of losing their souls, the obligation of receiving His doctrine. The presence of the Holy Spirit was to preserve the Apostles from error and keep them perfectly united in their teaching.

Besides the gift of infallibility (q.v.), He conferred on them jurisdiction over all believers, the right to govern with threefold power, legislative, judicial, and executive. Moreover, they were to sanctify men by certain religious rites, called sacraments (q.v.), and for this purpose received the gift of Holy Orders (q.v.). To Peter (see SAINT PETER), one of the Twelve Apostles, was granted a primacy, not merely of honor, but of jurisdiction. On him was Christ's Church to be built; he was to feed the entire flock, the lambs, and the sheep. By thus organizing a body to teach, govern, and sanctify men under the primacy of Saint Peter, Christ founded a religious society, supernatural in aims and means, and he chose for it the special name,

CATHOLIC CHURCH

the Church. (See CHURCH, AN ORGANIZATION OF CHRISTIANS.) This society was to last even unto the day of judgment; its duty was to teach all men, wherefore the Apostles appointed their successors and transmitted to them the authority received from Christ. As the primacy of Saint Peter was the firm foundation, necessary to insure the unity and stability of the Church, it too was to last forever. The power he received was for him and his successors. There never should come a time when the doctrine of Christ would be lost through corruption.

Whence we gather that there exists to-day a religious society, empowered to teach with certainty all the truths of Christianity, and that it is a visible body, united in its government and religious teachings. The members of this society submit to its infallible teaching by profession of the faith, to its sacred ministry by the reception of baptism (q.v.) and to its ecclesiastical rule by obedience. If all men are obliged to enter this society, it is evident that Christ provided some signs, notes, or marks by which His Church can become known to all earnest inquirers, by which it can be distinguished from other associations. Christ intended that His Church should be known by Unity. It was to be one in faith, one in government, one in worship, and one in the charity uniting all its members. It was to be known by Holiness. The Church is holy in its Founder; in its aim to lead men to God; in its means of sanctification, in the heroic virtue of many members, and in the permanence of miracles among them. It was to be Catholic; that is, conspicuously diffused everywhere. Finally it was to be Apostolic. The governing and teaching body is the continuation of the Apostolic body to which Christ gave His mission and with which He promised to remain until the end of time. Whoever is not in communion with the successor of Saint Peter cannot possess union with the Apostolic body. The obligation of becoming a member of the Church is often expressed in these words: "Out of the Church there is no salvation." They do not mean that all who die out of the visible communion are lost. God does not inflict punishment but for a wilful fault, and those who without fault cannot see their obligation of joining the Church, are not to blame. If, however, anyone, knowing this obligation, refuses to comply with it, he puts himself out of the way of salvation. The same holds true for those who neglect to examine properly into a matter of so great importance.

Catholics hold that the marks of the true Church of Christ are found only in the Church in which the bishop of Rome holds the primacy. The bishops of this Church all over the world are the successors of the apostles, possessing the right to teach, to rule, and to sanctify. The gift of infallibility, that is, the right to declare that certain doctrines have been revealed by God is not personal to each bishop, but belongs only to the whole body of bishops, whether gathered in general council or not. The consent of the universal Church according to Christ's promise is a sure criterion of revelation. To the Bishop of Rome as the successor of Saint Peter belongs the primacy of jurisdiction over the whole Church, complete, supreme, ordinary, and immediate over each and all the churches of the world, over each and all the bishops and the faithful.

In this primacy is included the supreme authority as teacher of the Church, or the prerogative of papal infallibility. By virtue of a special supernatural assistance of the Holy Spirit promised to Saint Peter and his successors, the pope cannot err when, as supreme teacher of the universal Church, he defines a doctrine concerning faith or morals to be held by the whole body of the faithful. Only when these four conditions are fulfilled is the pope infallible: First, he must speak not in his private capacity, not merely in his official character, but as supreme teacher. Secondly, the matter defined must concern faith or morals. Thirdly, the judgment must be delivered with the manifest intention of commanding intellectual assent. Fourthly, the definition must be given to the whole body of the faithful. It is clear that infallibility has absolutely no connection with the pope's personal qualities and is entirely distinct from impeccability, or incapability of sinning. The extent of papal infallibility is the same as that of the Church's infallibility. It embraces all the truths that God has revealed as the object of faith, and extends to other truths and matters of faith without assurance of which it would be impossible or very difficult to preserve the deposit of revealed truth.

It follows from what we have hitherto said that whoever wishes to know Christ's doctrine must appeal to the living authority. The Church as teacher, that is, the bishops now living in union with the pope, can alone tell us what doctrines were revealed. This knowledge is not acquired from new revelations, but with the assistance of the Holy Ghost from various sources, chief among which is the preaching of the Gospel, by which the doctrines of Christ are handed down as a sacred heritage from age to age. Thus, even if nothing had ever been written, we should have to-day, uncorrupt and infallible, the means of preserving religious truth which Christ established, namely Tradition. However, it was natural that those who were commissioned to teach should also set down their teaching in writing. Hence we possess many documents and monuments from which we learn what the Church taught in past ages and what it now teaches; the truths revealed remain unchanged. Moreover, we learn from the Church that God Himself provided, by means of men, certain writings, containing revealed truth, and gave them to the Church for the instruction and direction of the faithful. (See BIBLE.) From it alone we learn what books have been so inspired and constitute Holy Scripture; the Church alone can authoritatively interpret these writings. Tradition, therefore, is prior to the Christian scriptures both in time and in thought. It is wider in its scope, for it embraces Scripture as an instrument by which tradition is handed down and on the other hand contains matters which are not in Scripture. First and principally, tradition teaches us the authoritative character of Scripture itself. Even were all the copies of Scripture destroyed, the living voice would still proclaim the entire Christian teaching. Catholics yield to none in their esteem of Holy Writ, as the inspired word of God, but they so esteem it because of what they learn concerning it from tradition. The chief sources from which this tradition is learned are the acts of councils, the writings of the

CATHOLIC CHURCH

popes, of the Fathers of the Church, inscriptions, monuments, pictures, liturgies, rites, and pious customs, in a word, every way in which the Church is wont to profess her faith.

The Chief Doctrines of the Catholic Faith.— Catholics believe in one, true, living God, the Creator and Lord of heaven and earth and of all things visible and invisible, almighty, eternal, immense, and incomprehensible; infinite in will and intellect, and in all perfection, who, being one, singular, absolutely simple and unchangeable spiritual substance is to be regarded as distinct really and in essence from the world, infinitely happy in and from Himself and unspeakably elevated above all things that exist or can be conceived. He knows all things in the most perfect manner, by one all-embracing act of His intellect, from eternity to eternity ever the same. He knows His own being, all things that are possible, past, present, and future, and all things that are not and never have been nor will be, but which would be if some condition were fulfilled. He is all-wise, all-holy, all-just, true, faithful, and bountiful. Moreover, in God as there is one divine nature, so there are three divine persons, Father, Son, and Holy Ghost, really distinct from one another, perfectly equal to one another. Nevertheless there are not three Gods, but one God. The Father is unbegotten, the Son is begotten of the Father, and the Holy Ghost proceeds from the Father and the Son. (See TRINITY, DOCTRINE OF THE.) This one true God of His goodness and by His omnipotent power, not in order to increase His happiness, not to acquire perfection, but to manifest it by the good which He imparts to His creatures, in accordance with His absolutely free decree, at once from the beginning of time framed out of nothing as to the whole of their substance, two kinds of creatures, spiritual and material, the angels and the world, and then man, in whom spirit and matter were united. God preserves and governs by His providence all things that He has created.

To the angels He gave sanctifying grace and with it the power to merit eternal happiness by free service. Many of them rebelled and were cast into everlasting fire, the rest were confirmed in grace and admitted to the beatific vision of God. God "formed the body of the first man out of the slime of the earth." He created his soul immediately, as He creates the soul of every man; the soul is a spirit, endowed with intellect and free-will, and immortal. All men are descended from Adam (q.v.) and Eve. Like the angels, our first parents were also raised to a supernatural state by the infusion of sanctifying grace into their souls, being made adopted children of God, destined to the enjoyment of the beatific vision. This is the principle of supernatural life, whereby man can produce works that merit a heavenly reward. Moreover, God bestowed on man other preternatural gifts: great powers of mind and infused knowledge, complete control of the passions, immortality, and exemption from suffering and decay. This original justice our first parents lost by mortal sin, that is, by a grievous, wilful violation of God's law; in consequence of Adam's sin all of his descendants were deprived of those privileges, are conceived in original sin, and cannot of themselves enter the kingdom of heaven.

To atone adequately for the grievous insult to God and to repair the evil done to mankind, the second person of the Trinity became man. Jesus is true God and true man, one Divine Person subsisting in two natures, divine and human, not by the conversion of Divinity into flesh, but by the assumption of humanity unto God. He was born of the Virgin Mary, who was truly the Mother of God and remained a Virgin in conceiving and bearing her divine Son and ever after till the end of her life. By singular privilege of God through the merits of Christ, the Redeemer, the Blessed Virgin was preserved free from original sin (q.v.), that is, in the first moment of her conception, when her soul was created, it was endowed with sanctifying grace. By further privilege she was never guilty of any actual sin, mortal or venial. See MARY; IMMACULATE CONCEPTION.

Christ, the God-man, became our Redeemer, not by the mere effect of His preaching and example, but by His bloody death on the cross. He made Himself our mediator with His Father, offering atonement for the sins of all men. This satisfaction is not applied to those who have use of reason without their free employment of the means ordained by Christ. He merited for us the remission of sins, sanctifying grace, and all other graces conferred on man. After His death, He rose again on the third day, ascended into Heaven, where He sits at the right hand of the Father, whence He shall come with glory to judge the living and the dead, and of His kingdom there shall be no end. He founded a Church and confided to it the task of teaching His doctrines and applying to men's souls the means of sanctification. This Church is the guardian and interpreter of revelation; for though the existence of God can be known with certainty by the light of reason, it has pleased the Divine Wisdom to reveal many natural truths as well as all those that regard our supernatural life. This revelation is contained both in written books and in unwritten traditions. The books of the Old and New Testament, held by the Church to be sacred and canonical, were written by the inspiration of the Holy Ghost and have God as their author. In matters of faith and morals the true meaning of Scripture is that which is maintained by the Church. All interpretations at variance with the unanimous consent of the Fathers, when they speak as witnesses of tradition, are false and forbidden.

Whatever is presented to us by the Church as revealed truth must be accepted by the free assent of the intellect, not because of its intrinsic truth seen by the light of reason, but on the authority of God who has given the revelation, and who can neither be deceived nor deceive. This divine revelation has been made credible by external proofs, especially by miracles and prophecies; yet as faith is a supernatural virtue, the act of faith requires the assistance of divine grace, enlightening the intellect and strengthening the will and making our act supernatural. Without faith there is no justification, but as God wishes all men to be saved, all receive, either proximately or remotely, the grace to believe. Among revealed truths some are mysteries that cannot be demonstrated by human reason, but must be believed. The demonstrations of reason cannot contradict

CATHOLIC CHURCH

revelation, hence any assertions of human science that are at variance with what the Church teaches to be revealed must be false.

As grace is necessary for the beginnings of faith, and even for the pious affection toward believing, so it is needed to make our good works deserving of a supernatural reward. Grace is needed even for the just to avoid sin. Final perseverance is a special privilege of dying in the state of grace. Apart from a special revelation, no one can know that he will receive this blessing. Without grace, however, it is possible to resist less urgent temptations and perform acts that have natural goodness; hence all works done before justification are not sins. According to Catholic doctrine, actual grace is a real influence exerted by the Holy Ghost upon the soul, but it does not destroy the free-will of man. A grace may be fully sufficient for a supernaturally good act, but if a man refuse to act with it, the grace will not be efficacious. God will not save us without our co-operation. See GRACE OF GOD.

Actual graces aid us to obtain habitual or sanctifying grace, that is, to be justified by the remission of original sin or of grievous actual sin. This sanctifying grace makes us like unto Christ, holy and supernaturally pleasing to God, and brings with it the infused virtues and the gifts of the Holy Ghost (q.v.). There are many grades of habitual grace; it may be increased by good works, and on the other hand may be entirely lost by mortal sin. God in His mercy offers to man supernatural happiness and makes this offer known by the preaching of His Church, which he accompanies by an interior stirring grace. When a man co-operates with this grace, he believes the truth with absolute certainty and is moved by the thought of God's love; he sees reasons to fear God's justice and throws himself on God's mercy, trusting in the merits of Christ; hence he conceives a love of God and a detestation of sin. Thus by the working of grace and the co-operation of man's free will, the way is prepared for justification; and, provided that man puts no obstacle, the Holy Ghost works this justification by infusing charity into his soul, thereby destroying sin. Thus purified, he enters on a virtuous life, hoping by the merits of Christ to enter heaven, but he has no absolute certainty of his salvation.

In the process of justification, the first grace cannot be merited at all; for no supernatural reward is due to natural acts. With the aid of grace both sinners and just can merit further actual grace, but only congruously and not with any strict right in justice. The just, that is, those in a state of grace, can merit final perseverance congruously, and, because of God's promises, can merit in justice the increase of habitual grace, eternal life, and increase of glory. By mortal sin, all merit is lost.

As a means of justification Christ has entrusted to His Church seven Sacraments (q.v.), or sensible rites, instituted by Him to effect in the soul the grace which they signify. When the necessary conditions are placed, the Sacrament works by its own efficacy and not through the piety of the minister nor of the recipient. The Sacraments are Baptism, Confirmation, Holy Eucharist, Penance, Extreme Unction, Holy Orders, and Matrimony. Baptism and Penance remit sin; the others cannot lawfully be received in mortal sin. Baptism, Confirma-

tion, and Holy Orders can be received only once, because they imprint on the soul an ineffaceable mark, called the sacramental character. All the Sacraments, if properly received, give sanctifying grace or increase it, if already in the soul. Since the promulgation of the Gospel, justification cannot be obtained without Baptism of water, which blots out original sin and all actual sin. Infants who die without Baptism cannot enjoy the supernatural vision of God. In adults, when baptism of water cannot be received, pardon of sin can be obtained by the baptism of desire, which consists in a perfect love of God and a sorrow for sin, including, at least implicitly, the desire of the Sacrament. Remission of sin is also granted to all who suffer martyrdom for Christ. Sins committed after baptism are remitted by the Sacrament of Penance (q.v.), in which the sinner confesses with contrition all his mortal sins to the duly authorized priests of the Church, from whom he receives absolution. Sins are also remitted by perfect contrition, but the obligation of Divine Law requires that even then, if possible, they must be confessed. Penance pardons the guilt of sins confessed and repented of, infuses or increases sanctifying grace, remits eternal punishment, if it was due, secures actual graces to avoid sin in future, and may also remit, wholly or in part, the temporal punishment still to be undergone for sins the guilt of which has been pardoned. The whole punishment is not always remitted with the fault; for the remaining debt satisfaction is made to God by sufferings patiently borne or voluntarily inflicted. For this purpose also the Church has the power of granting indulgences, which are not a remission of sin, much less a permission to commit sin, but the remission of the whole or part of the temporal punishment which may be due for sins, after the guilt has been pardoned. See INDULGENCE.

In the Holy Eucharist there is really and substantially present the Body and Blood, Soul and Divinity of our Lord Jesus Christ, under the appearances of bread and wine. By the words of the priest at the consecration, there is effected a conversion of the whole substance of the bread into the Body and of the whole substance of the wine into the Blood, which conversion is called transubstantiation (q.v.). By force of the words, the Body is under the species of the bread and the Blood under the species of the wine, but in virtue of the natural connection and concomitance by which the parts of Christ are linked together, He exists whole and entire under each species and every part of the species. In the Mass (q.v.) there is offered to God a true, proper, and propitiatory sacrifice for the living and the dead. To offer up this sacrifice, Christ instituted a visible and external priesthood and the Sacrament of Holy Orders (q.v.); the minister of this Sacrament must be a bishop, who has received the fulness of the sacred ministry. The various orders constitute the Hierarchy. Priests cannot ordain or confirm. Other orders are the diaconate, subdiaconate, and the minor orders (Acolyte, Exorcist, Lector, and Ostiarius). Before the minor orders, the tonsure is conferred as a sign of enrolment among the clergy, who are separated from the rest of the faithful, called the laity. The right to exercise the sacred functions within appointed limits is

CATHOLIC CHURCH

called jurisdiction; it is required for the lawful performance of all functions and for the validity of some. The Roman pontiffs have, by Divine institution, universal jurisdiction. The other bishops have power to govern the dioceses to which they have been assigned by the pope.

Marriage between Christians was raised by Christ to the dignity of a sacrament. Its essence lies in the contract freely made between man and wife; the grace conferred is first an increase of sanctity, and, secondly, actual grace to fulfill the duties of the married state. The bond of Christian marriage after consummation is absolutely indissoluble; it is also exclusive, no man can have several wives, no woman several husbands, at the same time. Those who, with the aid of God's grace, fulfil the obligations of virginity or celibacy live in a state more holy and better than the state of matrimony. From the fact that Christian matrimony is a Sacrament, it follows that it has been intrusted to the Church and is subject to the laws of the Church, not to those of the State; hence the Church has the power of assigning conditions necessary for the validity or lawfulness of the contract between those who have been baptized. See MARRIAGE.

The means of sanctification are given to men to enable them to live and die in the state of sanctifying grace. At the hour of death each soul is judged by Christ, and if in mortal sin, is condemned to hell to be punished by eternal torments, varying in intensity according to the degree of guilt. Those who die free from all sin, mortal and venial, and from all the temporal punishment for sin, are admitted at once to life everlasting, to perfect beatitude in the vision of God. The saints and angels in heaven offer up prayers for men, and it is good and useful to invoke their intercession that we may obtain favors from God through Jesus Christ, who is our sole Redeemer and Saviour. Catholics honor and worship the saints and angels, and especially the Blessed Virgin Mary, because God loves and honors them, and because of their own personal sanctity; not, however, with the supreme worship that belongs only to God. Because of their special connection with holy persons, honor is also given to relics of the saints, to images and paintings of Christ and His saints. If men die in venial sin, or temporal punishment be still due, their souls are detained in Purgatory (q.v.) until expiation is made. In this state they can no longer merit for themselves, but can be assisted by the prayers and good works of the faithful and particularly by the holy sacrifice of the Mass. The Church has the power to apply indulgences for their relief. In addition to the particular judgment, immediately after death, there will be a general judgment at the end of the world. The body will rise from the grave reunited to the soul, and share for eternity either happiness in heaven or punishment in hell.

The chief duties of Christian life are expressed in the Ten Commandments of God and the commandments of the Church. Many laws have been imposed by the Church on particular classes or for special purposes; all Catholics, however, are bound, under pain of mortal sin, to hear Mass and rest from servile work on Sundays and Holydays of obligation, to fast and to abstain from certain food on the days

appointed, to confess all mortal sins at least once a year, and to receive the Holy Eucharist during the Easter time.

A Catholic must believe all the truths God has revealed and teaches through His Church. Denial of one such would mean either the denial of God's veracity or of the Church's infallibility. But it is not necessary that he should know explicitly more than the principal truths; all others are included in his acceptance of the Church as a divine teacher, alone capable of declaring what truths are contained in the *deposit of faith* handed down from the apostles. The definition of a dogma by the Church brings no change in doctrine; for no truth once taught as of faith is ever given up nor can any point be added which was not contained, at least implicitly, in the original teaching. However, the Church's infallibility is not limited merely to revealed doctrines; she can also speak infallibly on matters necessary to safeguard revealed teaching. Belief in such decisions is called ecclesiastical faith. Outside the domain of divine or ecclesiastical faith, there are many subjects of pious belief among Catholics. Some of these may perhaps belong to the deposit of faith, but they are not yet authoritatively proposed. Others depend on human testimony, and are accepted with that degree of certitude which the testimony warrants.

In the expression of revealed truths and in the defense of faith from the charge of conflict with demonstrated truths of science and philosophy, the Church makes use of terms derived from the philosophy current among its subjects. Thus it has come about that the dogmas are expressed in the terms of scholastic philosophy and officially in the Latin language. As its doctrines can be taught in any language, so, too, the expression of them may be harmonized with whatever is found to be true in any system of philosophy.

In the worship, liturgies, discipline, and practices of the Church, some regulations may be of divine origin, others are of ecclesiastical origin, and still others arise from the voluntary piety of individuals. Besides the ordinary obligations of Christian life, she invites those of her children who feel the call from God to bind themselves by vow to His service. The principal vows are those taken to observe the evangelical counsels of poverty, chastity, and obedience. Those who have thus bound themselves in approved congregations or religious orders are called *religious*. (See ORDERS, RELIGIOUS.) As a matter of discipline all those in Sacred Orders in the Latin portion of the Church are bound to observe celibacy. In the Greek portion, to-day, no priest can marry, but married men may receive Holy Orders, except episcopal consecration.

External Organization of the Church.—Supreme jurisdiction, as we have seen, resides in the Pope: the bishops are the rulers of dioceses, which are subdivided into parishes or missions under a parish priest or rector, assisted by curates. The dioceses are united into provinces, over each of which is an archbishop or metropolitan, the other bishops being called his suffragans. The archbishop convokes provincial synods, hears certain appeals from the episcopal court, watches over the observance of ecclesiastical law in some particulars, and, under certain circumstances, appoints an administrator when a

CATHOLIC CHURCH

suffragan dies. The patriarchate is to-day only an honorary rank. The Pope is represented in some countries by apostolic delegates, to whom are referred appeals from the lower courts and through whom the Pope sends his communications. In some countries there are apostolic nuncios, who deal directly with the various governments that have their representatives at Rome.

The Pope is assisted immediately by the Sacred College of Cardinals and by the Sacred Congregations. The College of Cardinals, when complete, contains 70 members: 6 Cardinal Bishops of the Suburban Sees, 50 Cardinal Priests, and 14 Cardinal Deacons. The Sacred Congregations, 21 in number, are committees of Cardinals to whom special affairs are entrusted. They were arranged, almost as at present, by Pope Sixtus V. The Cardinals alone cast votes for the final decisions, but they are assisted by secretaries and consultors. The Pope himself acts as prefect of some congregations (the Inquisition, the Apostolic Visitation, and the Consistorial). A Cardinal presides over each of the others. The acts of all congregations are submitted to the Pope for his approval. These acts, unless promulgated in a solemn manner as the acts of the Sovereign Pontiff himself, are subject to change; though not infallible, they must be received by the faithful with an internal assent, such as is due to religious authority and obeyed as laws of the Church. The more important congregations are: the Holy Roman Inquisition (the supreme tribunal to judge of heresy and crimes allied with heresy), the Consistorial (which selects the matters that are presented and sanctioned by the College of Cardinals assembled in the Papal Consistories), the Apostolic Visitations, Bishops and Regulars, the Council of De Propaganda Fide (which cares for missionary countries), Sacred Rites, the Index (which prohibits the reading of books condemned as contrary to faith or good morals), Indulgences and Relics, and the Congregation of Studies.

The Church and Civil Authority.—The Church was established by Christ as a perfect, independent religious society. Its authority depends on God's ordinances alone; wherefore it has always denied any right on the part of the state to interfere in its internal affairs. In Catholic countries, the Church claims immunity for its officials from the authority of civil tribunals; in past ages this immunity was often absolutely necessary for their just protection. Sometimes the Pope makes a Concordat with temporal rulers: that is, a treaty whereby, in consideration of certain promises of these rulers, the Pope abstains from urging certain of his rights. To exercise the prerogatives which we have described, the Pope, his Cardinals, and other officials must be exempt from the jurisdiction of any civil tribunals. Practically this cannot be secured without the Temporal Power (q.v.), or better, the Temporal Independence of the Sovereign Pontiff. It is not enough for the Pope to be free, he must be known to be free: suspicion of being under the influence of a sovereign would be fatal to his influence. This independence he possessed for more than 15 centuries; it was assured by the recognition of his sovereign authority in the states of the Church. Since the usurpation of these states by the Italian government, the Popes, Pius IX., Leo

XIII., and Pius X., have not ceased to proclaim: (1) that this seizure was an act of injustice; (2) that the Pope no longer possesses the freedom, security, and independence demanded by his dignity, his rights, and for the proper exercise of his authority; and (3) that the Holy See must insist on these facts and look forward to some efficient remedy for the injustice and indignity of present conditions. To deal rightly with Catholics of all nations, the Pope must be extra-national. As the seat of our general government, the District of Columbia, is independent of all the States, so the seat of the general government of the Church should be independent of all the countries of the earth.

History.—The history of the Roman Catholic Church may be divided into three great epochs: (1) Christian Antiquity, embracing the first seven centuries, during which Christian civilization was chiefly Greek and Roman. (2) The Middle Ages, from the 8th century to the 16th, characterized by the Church's action among the various peoples of north and central Europe, who were molded into organized nations by her influence. (3) The Modern Age, from the rise of Protestantism to the present day, during which the Germanic nations separated from the Church and attached themselves to various sects, and the Church has had to struggle against the modern, infidel spirit in science and government.

The first epoch contains two periods. First comes an era of persecution, during the struggle with paganism, which was terminated by the edict of Milan (313); then, an era of development in definitions of dogma against the attacks of heresy. The second epoch embraces four periods: I. The conversion of the barbarians. II. The development of the Western Empire and the Church's struggle to maintain her independence (800-1073). III. The supremacy of the Church maintained (1073-1300). IV. Attacks on the Church's supremacy, from Boniface VIII. to Protestantism.

During the third epoch three periods may be distinguished: I. The period of religious warfare, ending with the Peace of Westphalia, 1648. II. From 1648 to the French Revolution: the era of established Churches. III. Down to the present day: Neo-paganism in science and life, the age of unrestrained freedom to accept or deny the truths of religion.

Even while the Church was undergoing cruel persecution, she was also developing her discipline and defending her doctrines against the pagans and heretics. From the first three centuries have come down to us the valuable works of Ignatius, Polycarp, Justin, Clement of Alexandria, Origen, Tertullian, Cyprian, and many others. The mightier struggle with heresy, and her marvelous growth after she emerged from the catacombs, gave renown to Athanasius, Basil, the Gregories in the East and West, Chrysostom, the Cyrils, Hilary, Ambrose, Jerome, Augustine, Leo, and a host of other Christian writers, of whose works the modern world knows very little. The growth of monasticism (q.v.) is one of the glories of this age. Monks and nuns consecrated their lives to God's service by prayer and study and labor, thus preserving the ancient civilization from utter destruction by the barbarians, and preparing for the Church the means of converting these barbarians and transforming them into the

CATHOLIC CHURCH

civilized communities of Europe. The intimate union which existed between Church and State gave rise to the Holy Roman Empire (q.v.) and to the great body of laws by which their mutual relations were regulated. Frequent attempts were made later to subject the Church to the Empire. They were frustrated by the Popes, and especially by Gregory VII., after whom comes the glorious period of vigorous life and eminent learning. Among the orders that were then founded we may mention the Carthusians, Cistercians, Franciscans, Dominicans, and Servites, fruitful in numerous saints and scholars. The Church boasts of Saint Anselm, Peter Lombard, Albertus Magnus, Saint Thomas Aquinas, Saint Bonaventure, Duns Scotus, Saint Bernard, and others. It was also the age of Crusades (q.v.) for the recovery of Palestine. The 14th and 15th centuries are noted for the revival of interest in pagan literature, the sad exile of the Popes at Avignon, and frequent movements to effect a much-needed reformation of morals. In this work, many rejected the divine authority of the Church and were cast out as heretics; they are generally regarded as forerunners of Martin Luther (q.v.), who succeeded in separating whole sections of Germany from the Church, and became the occasion for the counter reformation that was effected by men like Francis de Sales, Ignatius Loyola, and Peter Canisius during the 16th century, and especially by the great work of the Council of Trent (1545-63). At this same period, millions of pagans were brought into the Church by the heroic labors of her missionaries, notably in South America, India, Ethiopia, and Japan. England, under Henry VIII. and Elizabeth, renounced the supremacy of the Pope, made a state religion of its own, and by the penal laws almost annihilated the Catholics. France remained Catholic, but, becoming infected with Jansenism and Gallicanism (qq.v.), and later with atheism and socialism, brought about the utter disorganization of Continental society. In the reconstitution of the shattered nations, Napoleon (q.v.) thought to make the Papacy his tool, and thus ruin the Church; but he failed, and the 19th century witnessed the gradual revival of the Church in almost all European countries, and its stupendous growth in the United States and other English-speaking countries. Catholic emancipation in England (1829), the Tractarian movement (see TRACTARIANISM) in the Established Church, that resulted in so many converts to Rome, and the restoration of the Catholic hierarchy (1850), have given Catholics prominence in English life. In France, though the people are loyally Catholic, the government is engaged in controversy with the Church and in the attempt to control Catholic education. When the French garrison was withdrawn from Rome in 1870, the Papal states and the city of Rome were annexed and added to the Italian kingdom. For the past 34 years the Pope has never left the Vatican Palace. Shorn of their earthly kingdom, Pope Pius IX. (q.v.) and Leo XIII. (q.v.) witnessed the attempt of Bismarck (q.v.), in Germany, to subject the Catholic Church to the State; but they witnessed also the failure of the attempt and the repeal of almost all the iniquitous laws. Persecution served only to unite all Catholics and revealed to them the power of united action. In the United States

the Church has grown from 244,500 in 1820 to 12,000,000 or 13,000,000 in 1900. This great increase has been due mainly to immigration from Europe and Canada. Irish, Germans, French Canadians, Italians, Poles, and Bohemians have come in large numbers. Meeting with no official opposition, the Church has prospered and is regarded even by many non-Catholics as a strong power for the preservation of the republic from the new social dangers that threaten the United States as well as the whole civilized world.

The activity of the Church in the mission field was almost destroyed by the wholesale confiscations of the French Revolution. As soon as order had been established in Europe, the missions revived, and, especially since Gregory XVI., have spread to every land of the world. Dioceses are mapped out and bishops appointed as soon as the circumstances warrant. The reorganization of the Congregation *De Propaganda Fide* by Pius IX., with separate sections for the Latin and the Oriental Churches, has been of great advantage. Colleges, institutes, and special religious congregations have been founded in various cities of Europe for work in the foreign missions. The Association for the Propagation of the Faith is the largest of the societies among the laity for the collection of funds. Missions are also conducted with success in the Oriental Churches in communion with the Holy See. These Churches hold the same doctrines as the Latin Church, but have special rites, discipline, and liturgical language. There are four chief groups: I. The Greek, subdivided into Greek proper, Melchite, Slav (which is Ruthenian and Bulgarian), and Rumanian. II. The Syrian, subdivided into Syrian proper, Syro-Chaldean (which also included the Malabar) and Maronite. III. The Coptic, which is Egyptian and Abyssinian or Ethiopian. IV. The Armenian. Pope Leo XIII. was much interested in these eastern churches, and had the joy of receiving many converts into communion. See MISSIONS, ROMAN CATHOLIC.

Statistics.—The number of Catholics throughout the world, according to the latest computations given by H. A. Krose, S.J., in the 'Stimmen aus Maria Laach,' July-August 1903 (republished in the 'Catholic World,' New York, February 1904), is 264,505,922. They are distributed as follows: Asia, 11,513,276; Africa, 3,004,563; Australia and Oceania, 979,943; America, 71,350,879; Europe, 177,657,261. These numbers, according to the compiler, represent less than the whole number of Catholics, on account of the impossibility of obtaining official reports. He believes that there are at least 270 millions. For America the following numbers are given:

British North America, 2,301,693; United States, 10,970,757; Central America, 16,150,946; West Indies, 4,064,481; South America, 36,957,002; total, 71,350,879. In the Philippine Islands there are 6,500,998 Catholics. The number of Catholics assigned to the United States is regarded by the ecclesiastical authorities as too low; it is variously estimated at thirteen or fourteen millions. The following table gives the estimated number in the chief countries of Europe:

Austria Hungary, 35,570,870; Belgium, 6,660,000; Denmark, 5,373; France, 38,180,000; German Empire, 20,321,447; Great Britain, 2,-

CATHOLIC COLLEGES IN EUROPE—CATHOLIC EMANCIPATION ACT

000,000; Greece 34,710; Ireland 3,500,000; Italy, 32,300,000; Holland, 1,790,161; Norway, 1,969; Portugal, 5,277,000; Russia and Finland, 11,326,804; Sweden, 1,390; Switzerland, 1,383,135; Spain, 18,200,000; Turkey and Crete, 300,000.

Editor of 'The Messenger.'

Catholic Colleges in Europe, American.

(1) The Pontifical College of the United States at Rome, Italy. This institution was founded by Pius IX., and was formally opened by him 8 Dec. 1859. In 1884 Leo XIII. ranked it among pontifical colleges, with the privileges thereto appertaining. Ecclesiastical students only are admitted; students pursuing the courses in the humanities, philosophy, and theology at the Urban College of the Propaganda. In 1904 the number of students was reported as 97. (2) The American College at Louvain, Belgium. This was founded in 1857 by several American bishops. The rules and constitutions were confirmed by Leo XIII. in 1895. The objects of the institution are to educate for the priesthood American students sent by their bishops to Louvain, and to prepare students from Belgium and adjacent countries for important missions in dioceses of America. Only those students are admitted who have finished a complete course in philosophy at a Catholic college. There is a three years' course in theology at the University of Louvain, followed by higher studies leading to the various degrees in theology and canon law.

Catholic Copts, those native Egyptian Christians, about 5,000 in number, who acknowledge the authority of the Pope. One of their priests was made a vicar apostolic and bishop *in partibus* (residence at Cairo) in 1855; in 1895 Leo XIII. established over them a hierarchy, the head of which has the designation "Patriarch of Alexandria of the Copts."

Catholic Creditor, in Scots law, a creditor whose debt is secured by a lien or charge on more than one subject belonging to the debtor.

Catholic Education. See EDUCATION, ROMAN CATHOLIC; CANADA—CATHOLIC EDUCATION.

Catholic Emancipation Act, an act of the British Parliament passed in the 10th year of the reign of George IV., 13 April 1829, by which the Catholics of Ireland were relieved of civil

disabilities still persisting there after the more odious and oppressive provisions of the penal laws enacted in 1691, in violation of the stipulations of the Treaty of Limerick, had been gradually done away. For 50 years after 1691 those laws were enforced vigorously; from that time to the era of emancipation there was a gradual relaxation. The design of those penal laws was the extermination of the Catholic religion in the island and the administration of the government purely for the behoof of the "Protestant interest" and the "English interest." A Catholic was not permitted to be a landowner, nor even to hold land on lease, save for a brief term; the son of a Catholic could, by making profession of the Protestant religion, come into possession of his father's property, allowing to his parent an annuity; if a Catholic owned a horse, whatever its value, any Protestant might legally seize it on paying to the owner \$25; no Catholic priest could lawfully exercise his ministry in Ireland save under severe restrictions, and monks and friars were regarded as felons and punished as such; no Catholic could be a barrister, nor a schoolmaster; Catholics were ineligible to the Parliament of Ireland, or even as electors; they were not permitted to be freemen of boroughs. When the act of union of the kingdom of Ireland with that of Great Britain was passed William Pitt gave solemn assurance to the Catholics of Ireland that the last of their disabilities would be forthwith removed, and bills to that effect were brought into Parliament; but Pitt, giving way before the insane bigotry of King George III., did not press the measure and went out of office. The Catholics continued to demand their enfranchisement and emancipation, and their appeals were heard in the British Parliament; but it was seen that the hope of redress of grievances was vain unless a show of force was made, or a popular agitation set on foot. Daniel O'Connell, already a highly successful counselor-at-law, though not a barrister, owing to his disability as a Catholic, took the leadership of the Catholics of Ireland, and from 1824 till the act of emancipation was passed, Ireland was the scene of an unprecedented popular agitation, never equaled in any country till the agitation for the repeal of the union with Great Britain was set on foot immediately after the grant of Catholic emancipation. The British cabinet was alarmed by the outburst of popular enthusiasm in Ireland, and the House of Commons in 1825 passed a relief bill for Ireland, but the lords rejected it. A second relief bill, two years later, failed in the House of Commons. But the following year, 1828, the House, although the cabinet (Wellington's) was adverse, passed that second bill. This gave the cabinet and even the king (George IV.) pause, and it was confessed that really something might or must be done; but the agitation must cease. The reply of the Irish Catholics was to nominate O'Connell, despite his legal disability, for membership in the Parliament and to elect him triumphantly. He was a member of Parliament-elect, but he would not take the oath whereby he must accept the king's supremacy in religion. It was the king and the cabinet that had to retreat now. The bill for Catholic emancipation was brought into the House of Commons on 5 March 1829, and passed the first reading by a

CATHOLIC EPISTLES — CATHOLIC TOTAL ABSTINENCE UNION

majority of 188 in a House of 508 members; on the second reading the majority was 180; and on the final vote it was 178 in a House of 462. Even in the lords the measure was passed by a good majority, and the bill received the king's assent. The rights and privileges accorded to the Catholics of Ireland by this act were: that they were not to be required to take the oath of supremacy; that they became admissible to all offices in corporations and to enjoyment of all municipal rights. But no Catholic could be regent or lord chancellor, either of Great Britain or of Ireland; and they were incapable of holding offices connected with the Established Church or the universities. In all other respects the Catholics were to stand on an equal footing with Protestants.

Catholic Epistles, those letters in the New Testament which are addressed to the faithful in general, not to particular churches, as is that to the Philippians, that to the Ephesians, etc.; nor to individuals, as are the epistles of Paul to Timothy, Titus, etc. The catholic or general epistles are those of James, 1 and 2 Peter, 1 John, and the epistle of Jude. These same epistles are also styled Canonical, signifying, according to Calmet, that they contain excellent rules (*canons*) of faith and morals.

Catholic Indian Missions, Bureau of, an organization of the Roman Catholic Church, established in 1874 by the archbishop of Baltimore in behalf of Catholic prelates having Indian missions within their respective dioceses, in order to represent before the Government the interests of these prelates in all matters appertaining to Indian affairs. By decree of the 3d Plenary Council of Baltimore it was recognized as an institution of the Church and placed under the charge of a committee of seven prelates. This committee was dissolved in 1894; and the bureau, as then constituted, was superseded by a new corporation. The chief work of the bureau is the establishment of schools among the Indian tribes, and the obtaining from governmental and other sources of funds for their maintenance.

Catholic Knights of America, a fraternal organization established in Kentucky in 1877. It was chartered in 1880. Its object is to unite fraternally all acceptable Roman Catholics of every profession, business, and occupation; to give all possible moral and material aid in its power to members of the organization, by holding instructive and scientific lectures, by encouraging each other in business, and by assisting each other to obtain employment, and to establish and maintain a benefit fund for the benefit of the families of the members. The benefit fund is distributed according to well-established insurance rules. The age limits for admission are from 18 to 45. At first men only could become members; but since about 1901, women have been allowed admission on the same conditions as men, except the age limits for women are from 18 to 40. The executive power is vested in the Supreme Council (National) with headquarters in St. Louis, Mo.; the State councils, and the officers of the local branches. In 1903 there were 500 branches in the United States, with a membership of 30,000 and a reserve fund of \$600,000. Since its organization to 1903, there has been paid to beneficiaries \$13,000,000; but the material aid has been slight

compared with the spiritual, moral, and intellectual benefit the organization has effected. This is the pioneer Roman Catholic fraternal organization in the United States.

Catholic Majesty, a title given by Pope Alexander VI. to the kings of Spain, in memory of the complete expulsion of the Moors from Spain in 1491 by Ferdinand of Aragon. But even before that time several Spanish kings are said to have borne this title.

Catholic Missionary Union, The, an organization of the Roman Catholic Church established "to procure the services of clergymen and laymen of the Roman Catholic Church to teach and preach as missionaries of their faith in the United States and in furtherance of religious opinion"; "to lease, take, hold, and purchase places, buildings and lands for such teaching and preaching"; to provide for the maintenance of the workers; to publish and distribute books, pamphlets, and other reading matter in connection with these efforts; and to aid archbishops, bishops and other church authorities in the United States to establish and conduct missions within their respective jurisdictions. Its practical activity takes the form of the collection of funds to enable bishops of the various dioceses to reserve diocesan priests for missions to non-Catholics within their various jurisdictions and to maintain such missionaries in their work. The Apostolic Mission House, on the grounds of the Catholic University, Washington, D. C., is the training-school for diocesan missionaries.

Catholic Summer School of America, a school for higher education established by the Roman Catholics at Plattsburg, N. Y., on Lake Champlain. It was organized in 1892, and met at various places before the present site was decided upon. In 1893 the regents of the University of the State of New York granted a charter by which this school became a legal corporation, and was classified in the system of public instruction devoted to university extension. By this charter certain advantages are acquired by summer-school students who wish to prepare for the regents' or State's examinations. The object of the school is to increase facilities for those who wish to pursue lines of study in various departments of knowledge. Opportunities for instruction are provided by lectures from eminent specialists. Courses are given in anthropology, history, literature, ethics, science, and religion. The school is beautifully located, and though not far from the principal summer hotel on Lake Champlain, has its own cottage accommodations, a club or casino for social reunions, its lecture halls, and local book store. The place is an ideal summer resort and attracts many friends of education, both Roman Catholic and Protestant.

Another summer school, the **Columbian Catholic Summer School**, assembled at Madison, Wis., in July 1898, with lecturers from Washington, D. C., and other centres of educational work. In 1901 it removed to St. Paul, Minn., and adopted the name of the **American Catholic Chautauqua**.

Catholic Total Abstinence Union of America, a confederation of all the Catholic total abstinence organizations in this country. It believes that the virtue of temperance is a religious virtue, to be cultivated by religious

CATHOLIC UNIVERSITY OF AMERICA

methods. The membership, amounting in the year 1900 to 80,000, includes women's societies and juvenile organizations, as well as men's societies. While the union urges men to become total abstainers, it does not hold that drink is an evil in itself, or that the use of it is wrong, but that the use of it is for many the proximate occasion of sin; and that by such persons drink should be abandoned altogether. It does not assert that all goodness and virtue are in total abstinence, but it does hold that total abstinence is a powerful preventive of social disorder and sin. The office of the general secretary of the union is in the house of the Paulist Fathers in New York. The union publishes for circulation numerous pamphlets on the subject of total abstinence.

Catholic University of America, an educational institution founded for the purpose of affording an opportunity for pursuing higher studies in the most important branches under the guidance of the Roman Catholic Church. According to its constitutions, the courses of study must be of the highest possible grade; and the constitutions further declare that "the authorities of the university shall take care to confer with the directors of Catholic colleges and seminaries in our country so that all may labor unitedly to advance the education of Catholic youth. The clause in the constitutions concerning the 'higher studies' has been so interpreted that to-day the university is a purely post-graduate institution. Whether the bishops of the United States, who assembled in the second plenary council of Baltimore, contemplated this or not is open to question. It is certain, however, that in October 1866, they earnestly expressed the wish that there should be in the United States a university in which all branches of science, both sacred and profane, should be taught." The precise scope of the university or the time for its foundation were not then decided upon. The idea of a university of the highest class was formulated by the Right Reverend John Spalding, bishop of Peoria, on all appropriate occasions, and the effect of his discourses on public opinion had much to do with the contentment with which American Catholics received the announcement that the prelates of the United States had resolved, in November 1884, in the third plenary council, that a university should be founded. The offer of Miss Gwendoline Caldwell, now the Marquise Monstiers de Merinville, of \$300,000 was accepted. This gift was made for the purpose "of founding a grand theological seminary for the higher education of the clergy of the United States, said seminary to form the basis of a future Catholic university."

It was thought that Washington, not because it is the capital of the country, but because of the great educational advantages offered by its libraries, laboratories, etc., would be the logical site, and although other places were suggested, Washington, after mature consideration, was chosen in 1885 by the board of trustees. This decision was formally approved by the hierarchy on 7 Sept. 1887. The Middleton estate, near the Soldiers' Home—one of the most beautiful parts of the District of Columbia—was bought in the same year. In the following year, the Right Reverend John J. Keane, bishop of Richmond, now archbishop of Dubuque, was elected the first rector. In a letter, dated 20

Oct. 1885, the Holy Father, Leo XIII., had warmly approved of the project. Bishop Keane was sent to Rome, bearing all the important documents concerning the university, and, on 21 April it was incorporated under the laws of the District of Columbia. The corner-stone of Caldwell Hall—the school of sacred sciences—was laid on 4 May 1888, in the presence of the President of the United States, representatives of the foreign embassies and legations, and a large group of distinguished persons from all parts of the country. On 13 Nov. 1889, the School of Sacred Sciences—that department of theology and cognate studies for students who had made preparatory studies in the seminaries—was opened with solemn ceremonies. In all the epochs that marked the growth of the university, the interest, sympathy, zeal, and good judgment of its chancellor, Cardinal Gibbons, archbishop of Baltimore, were evident.

So far, while the basis for an ecclesiastical establishment existed, no provision had been made for laymen or for the founding of departments of learning not strictly included in the educational processes of priests. The Catholic hierarchy and the laity were united in desiring that some further provision should be made. The Reverend James McMahon, afterward as Monsignor McMahon, an honorary member of the papal household, a priest of the archdiocese of New York, offered to the university a gift of \$400,000. This donation was accepted by the board of trustees in 1891, and the corner-stone of McMahon Hall was laid on 27 April 1892. On 1 Oct. 1895, McMahon Hall was dedicated, and the schools of philosophy and social sciences, including law, were opened. On 24 March 1896, the school of the technological sciences was founded. The directors of the theological school, Caldwell Hall, saw the difficulties which a graduate student in a country where priests are so much in demand for active work would meet. The whole field of theology is so wide, and the time allotted comparatively so short, being two years for the licentiate and two more for the doctorate, that the student is expected to concentrate his work upon one major branch of theology. Minor branches may be taken by him in the school of theology, or one minor in the school of philosophy. The school of sacred sciences is divided into four groups—the biblical, the dogmatic, the moral, the historical. The faculty of philosophy, organized in 1895, contains within it the schools of philosophy, philosophy proper, based on the teaching of St. Thomas Aquinas; experimental psychology, etc.; letters, literature, philology, etc.; physical, biological, and social sciences. The degrees offered in the school of sacred sciences are the baccalaureate, the licentiate, the doctorate—S.T.B., S.T.L., S.T.D. The degrees in philosophy are Ph.M. and Ph.D. The faculty of law contains the school of law and jurisprudence, the school of social sciences having been transferred to the faculty of philosophy on 8 Feb. 1898. Under the board of the institution of technology is the school of the technological sciences.

In September 1896, Bishop Keane, the rector, was called to Rome, to receive later an appointment to the archbishopric of Dubuque. He was succeeded by the Very Reverend Dr. Conaty on 22 Nov. 1896. Having served the allotted term of six years, Bishop Conaty, during his term

CATHOLIC WINTER SCHOOL — CATALINE

titular bishop of Samos, was appointed bishop of Los Angeles, and in April 1903, the Right Reverend Monsignor Dennis J. O'Connell, who in the fall of 1902 had been appointed rector of the university, assumed his duties.

MAURICE FRANCIS EAGAN, LL.D.

Catholic Winter School, a school holding session in the winter months at New Orleans. The first session was held 16 February to 14 March 1896, and was very successful. New Orleans was chosen for its seat as one of the most catholic centres of American education, with Tulane University, the Howard Memorial Library, a fine system of public schools, and the record of French Catholic spiritual and intellectual activity extending through nearly two centuries. At the school popular education is naturally connected with religion: the sessions are opened with pontifical high mass in St. Louis Cathedral.

Catholic Women's Benevolent Legion, a fraternal and beneficial society, incorporated under the laws of the State of New York, 23 Aug. 1895. Age limits, 17 and 55. Branches have been established in nearly every State in the United States: membership, in 1903, 30,000. They have paid out to beneficiaries several thousand dollars, but keep well invested a safe reserve fund. Special efforts have been made to establish social and literary societies, and to promote the spiritual and temporal welfare of their members.

Catholic Young Men's National Union, an association for furtherance of Roman Catholic unity and the moral advancement of its members. The means relied on for accomplishing its object are: practical fulfillment by the individual members of the obligations imposed by their religion; fraternal union of all associations that aim in any way at the spiritual, intellectual, and moral improvement of Catholic young men, and the privilege assured to each member of being received as a guest by any society in the Union, or as a member by transfer. The third plenary council of the Roman Catholic Church of the United States, held at Baltimore, thus expresses approval of the union in its pastoral letter: "In order to acknowledge the great amount of good that the C. Y. M. N. U. has already accomplished . . . we cordially bless their aims and endeavors, and we recommend the union to all Roman Catholic young men."

Catiline (LUCIUS SERGIUS CATALINA), Roman conspirator: b. about 108 B.C.; d. Pistoia 5 Jan. 62 B.C. Of patrician birth, but poor, he attached himself to the cause of Sulla, had some share in his success, and still more in his proscriptions. Murder, rapine, and conflagration were the first deeds and pleasures of his youth. He appears to have served in the army with reputation. Sallust, who has written the history of his conspiracy, describes him as having a constitution that could support hunger, cold, fatigue, and want of sleep, to an incredible extent; with a spirit bold, cunning, fruitful in resources; lusting after the wealth of others, prodigal of his own; a man of fiery passions, but limited judgment. Such was his art, that, while poisoning the minds of the Roman youth, he gained the friendship and esteem of the severe Catullus. Equally well qualified to deceive the good, to intimidate the weak, and to infuse his own

boldness into his associates, he evaded two accusations brought against him by Clodius for criminal intercourse with a vestal, and for monstrous extortions, of which he had been guilty while proconsul in Africa. A confederacy having been formed of many young men of high birth and daring character, who saw no other means of extricating themselves from their enormous debts than by obtaining the highest offices of the state, Catiline was placed at their head. This eminence he owed chiefly to his connection with the old soldiers of Sulla, by means of whom he kept in awe the towns near Rome, and even Rome itself. At the same time he numbered among his adherents not only the worst and lowest of the populace, but also many of the patricians and men of consular rank. Everything favored the audacious scheme. Pompey was pursuing the victories which Lucullus had prepared for him; and the latter was but a feeble supporter of the patriots in the senate, who wished him, but in vain, to put himself at their head. Crassus, who had delivered Italy from the gladiators, was now striving after power and riches, and countenanced the growing influence of Catiline as a means of his own aggrandizement. Cæsar, who was laboring to revive the party of Marius, spared Catiline, and perhaps even encouraged him. Only two Romans remained determined to uphold their falling country—Cato and Cicero; the latter of whom alone possessed the qualifications necessary for the task. The conspirators were now planning the elevation of Catiline and one of his accomplices to the consulship, by which they hoped to obtain possession of the public treasures and the property of the citizens under various pretexts, and especially by means of proscription. Cicero had the courage to stand candidate for the consulship: neither insults nor threats, nor even riots and attempts to assassinate him, deterred him from his purpose; and being supported by the rich citizens, he gained his election, 65 B.C. All that the party of Catiline could accomplish was the election of Caius Antonius, one of their accomplices, as colleague of Cicero. This failure, however, did not deprive Catiline of the hope of gaining the consulship the following year. For this purpose he revived the kind of terrorism by which he had laid the foundation of his power. Meanwhile, he had lost some of the most important members of his conspiracy. Antony had been prevailed upon or compelled by Cicero to remain neutral. Cæsar and Crassus had resolved to do the same. Piso had been killed in Spain. Italy, however, was destitute of troops. The veterans of Sulla only waited the signal to take up arms. The signal was now given by Catiline. The centurion Manlius appeared among them, and formed a camp in Etruria. Cicero was on the watch: a fortunate accident disclosed to him the counsels of the conspirators. One of them, Curius, was on intimate terms with a woman of doubtful reputation, Fulvia by name, and had acquainted her with their plans. Through this woman Cicero learned that L. Vargunteius, a senator, and C. Cornelius, a knight, had undertaken to assassinate him at his house. On the day which they had fixed for the execution of their plan, they found the doors barred and guarded. Still Cicero delayed to make public the circumstances of a conspiracy, the progress and resources of which

he wished first to ascertain. He contented himself with warning his fellow citizens, in general terms, of the impending danger. But when the insurrection of Manlius was made known, he obtained from the senate the decree, only promulgated on occasions of the utmost importance, that "the consuls should take care that the republic receive no detriment." It was exceedingly difficult to seize the person of one who had soldiers at his command both in and out of Rome; still more difficult would it be to prove his guilt before judges who were accomplices with him, or at least were willing to make use of his plans to serve their own interest. Cicero had to choose between two evils — a revolution within the city, or a civil war: he preferred the latter. Catiline had the boldness to take his seat in the senate, known as he was to be the enemy of the Roman state. Cicero then rose and delivered that bold oration against him, beginning, *Quousque tandem abutere, Catilina, patientia nostra?* ("How long then, Catiline, wilt thou abuse our patience?") Assuming a confidence he did not possess, he attempted a reply, but his words were instantly drowned by the cries of "Parricide!" and "Traitor!" which rose on all hands. Now fully conscious that his plans were discovered, he rushed from the assembly with threats and curses on his lips, and left Rome at dead of night. The conspirators who remained, Lentulus Sura, Cethegus, and other infamous senators, engaged to head the insurrection in Rome as soon as Catiline appeared at the gates. According to Cicero and Sallust, it was the intention of the conspirators to set the city on fire, and massacre the inhabitants. Lentulus, Cethegus, and the other conspirators, in the meanwhile, were carrying on their criminal plots. They applied to the ambassadors of the Allobroges to transfer the war to the frontiers of Italy itself. These, however, revealed the plot, and their disclosures led to others still more important. The correspondence of the conspirators with their leader was intercepted. As the circumstances of the case did not allow of a minute observance of forms in the proceedings against the conspirators, the laws relating thereto were disregarded, as had been done in former instances of less pressing danger. Cæsar spoke against immediate execution, but Cicero and Cato prevailed. Five of the conspirators were put to death. Caius Antonius was then appointed to march against Catiline, but on the pretext of ill health, gave the command to his lieutenant, Petreius. He succeeded in enclosing Catiline, who, seeing no way of escape, resolved to die sword in hand. His followers imitated his example. The battle was fought with bitter desperation. The insurgents all fell on the spot which their leader had assigned them, and Catiline at their head. See Sallust, 'Bellum Catilinarium'; Cicero, 'Orations in Catilinam'; Rose, 'History of Catiline's Conspiracy' (1813).

Catinat, Nicholas de, Marshal of France: b. Paris 1637; d. Saint Gratiens 1712. He quitted the profession of the law for that of arms, and attracted the notice of Louis XIV. at the storming of Lille in 1667, and was promoted. By a number of splendid deeds he gained the esteem and friendship of the great Condé, particularly by his conduct at the battle of Senef. He was sent as lieutenant-general against the Duke of Savoy, gained the battles

of Staffardo, 18 Aug. 1690, and of Marsaglia, 4 Oct. 1693, occupied Savoy and part of Piedmont, and was made marshal in 1693. In the conquered countries his humanity and mildness often led him to spare the vanquished, contrary to the express commands of Louvois. In Flanders he displayed the same activity, and took Ath in 1697. In 1701 he received the command of the army of Italy against Prince Eugene; but was straitened by the orders of his court, and was destitute of money and provisions, while Eugene was allowed to act with full liberty. On 6 July he was defeated at Carpi. Equally unfortunate was the battle of Chiari, where Villeroy had the chief command. It was here, while rallying his troops after an unsuccessful charge, that he replied to an officer who represented to him that death was inevitable in such an encounter. "True, death is before us, but shame behind." In spite of his representations the French court would not believe the disasters in Savoy to be owing to the perfidy of the Duke of Savoy, and Catinat was disgraced. He was a true philosopher, religious without austerity, a courtier without intrigue, disinterested and generous when in favor, and cheerful in disgrace. From his unalterable calmness and consideration his soldiers called him "le Père la Pensée."

Catineau-Laroche, Pierre Marie Sebastien, pĕ-är ma-rê sâ-bäs-ti-ön ka-tê-nô lä-rôsh, French lexicographer: b. Saint-Brieuc 25 March 1772; d. 22 May 1828. He studied at Poitiers, and emigrated to St. Domingo, where he published a journal 'L'ami de la paix et de l'union.' He was sentenced to death for the opinions which he advocated, but, by the timely assistance of the agents of the king of France, succeeded in escaping to Cape Haytien (then called Cape François), where he alone of 17 of his countrymen was saved from the subsequent massacre in that city. He now visited the United States and England, and on his return to Paris, in 1797, prepared several dictionaries. His printing office having been destroyed by fire, the government employed him in various public capacities. Once more he visited the United States, and on his return, in 1819, he was commissioned to go to Guiana, and study the climate and resources of that province. His notes on that country appeared in 1822.

Catkin. See AMENT.

Catlin, George, American traveler and artist: b. Wilkesbarre, Pa., 26 June 1796; d. Jersey City, N. J., 23 Dec. 1872. After practising as a lawyer for two years he set up at Philadelphia as a portrait painter, and in 1832 commenced special studies of the American Indians, residing many years among them both in North and South America. In 1840 he went to Europe, and subsequently introduced three parties of American Indians to European courts. His finely illustrated works are: 'Manners, Customs, and Condition of the North American Indians' (1857); 'North American Portfolio' (1844); 'Eight Years' Travel in Europe' (1848); 'Last Rambles Among the Indians,' etc. (1868). His 500 portraits from life of American Indians are now in the National Museum at Washington, D. C.

Catlin, Henry Guy, American mining engineer: b. Burlington, Vt., 21 July 1843. He studied at the University of Vermont, and

CATLIN — CATO

served during the Civil War in the 12th Vermont Volunteers. Besides various contributions to the magazines, descriptive of western life, he has written 'Yellow Pine Basin' (1898).

Catlin, Louise Ensign, American writer: b. Lockport, N. Y., 9 May 1861. She was educated at Smith College, and was married to Frederick Ward Catlin in 1882. She has published 'Marjory and Her Neighbors.'

Catlinite, a dull red indurated clay. It occurs in Pipestone County, Minn., as a layer about 18 inches thick in quartzite. It has been extensively manufactured by the Sioux Indians into pipes and various ornamental objects.

Cat'nip, Cat'nep, or Cat-mint, a hardy perennial herb (*Nepeta cataria*) of the natural order *Labiata*. It is a native of the Orient and Europe, and has become distributed in most temperate regions of the globe. It is very common in America in the neighborhood of dwellings. Cats are especially fond of it, rubbing themselves upon it and eating it with evident relish. Like other members of its order, it contains a fragrant volatile oil, for which it is sometimes used in cooking. It grows about two feet tall, bears heart-shaped, velvety, whitish-green leaves, and dense whorls of numerous small, purplish or rosy-white flowers. Catnip is sometimes planted in herbaceous borders to soften the tinting, at the same time heightening the effect with its erect stems. In medicine, catnip tea enjoys great popularity with the laity. It is brewed hot and is very useful in attempts to avert "colds." The heat, volatile oil, and accompanying care that the patient takes are all self-conservative.

Cato, Dionysius, the reputed author of the small collection of moral apophthegms known as 'Catonis Disticha de Moribus ad Filium.' Nothing is known of him; but the work, which is apparently in large part a genuine classic, had a high reputation in the Middle Ages.

Cato, Marcus Porcius, THE CENSOR, surnamed PRISCUS, also SAPIENS ("the wise"), and MAJOR ("the elder"), Roman statesman and general: b. Tusculum 234 B.C.; d. 149 B.C. He inherited from his father, a plebeian, a small estate in the territory of the Sabines, which he cultivated with his own hands. He was a youth at the time of Hannibal's invasion of Italy, and served his first campaign, at the age of 17, under Fabius Maximus, when he besieged Capua. Five years after he fought under the same commander at the siege of Tarentum. After the capture of this city he became acquainted with the Pythagorean, Nearchus, who initiated him into the sublime doctrines of his philosophy, with which, in practice, he was already conversant. After the war was ended Cato returned to his farm. As he was versed in the laws, and a fluent speaker, he went at daybreak to the neighboring towns, and acted as counselor and advocate to those who applied to him. Valerius Flaccus, a noble and powerful Roman, who had an estate in the vicinity, observed the talents and virtue of the youth, conceived an affection for him, and persuaded him to remove to Rome, where he promised to assist him with his influence and patronage. A few rich and high-born families then stood at the head of the republic. Cato was poor and unknown;

but his eloquence, which some compared to that of Demosthenes, and the integrity and strength of his character, soon drew public attention to him. At the age of 30 he went as military tribune to Sicily. In the following year he was quæstor, at which period there began between him and Scipio a rivalry and hatred which lasted till death. Cato, who had returned to Rome, accused Scipio of extravagance; and, although his rival was acquitted, this zeal in the cause of the public gave Cato a great influence over the people. Five years after, having been already ædile, he was chosen prætor, and obtained the province of Sardinia. His strict moderation, integrity, and love of justice, were here still more strongly displayed than in Rome. On this island he formed an acquaintance with the poet Ennius, of whom he learned Greek, and whom he took with him to Rome on his return. He was made consul 192 B.C., having his friend Valerius Flaccus for colleague. He opposed with all his power the abolition of the Oppian law, passed in the pressing times of the second Punic war, forbidding the Roman women to wear more than half an ounce of gold, to dress in garments of various colors, or to wear other ornaments; but he was obliged to yield to the eloquence of the tribune Valerius, and still more potent female importunities. Soon after, he set out for Spain, which was in a state of rebellion. His first act was to send back to Rome the supplies provided for the army, declaring that the war ought to support the soldiers. He gained several victories with a newly raised army, reduced the province to submission, and returned to Italy, where the honor of a triumph was granted to him. He afterward put himself under the command of the Consul Manius Acilius, to fight against Antiochus, and to carry on the war in Thessaly. By a bold march he made himself master of the Calcidromus, one of the highest peaks of the mountain pass of Thermopylæ, and thus decided the issue of the battle. He brought the intelligence of this victory to Rome, 189 B.C. Five years after, in spite of a powerful faction opposed to him, he obtained the most honorable, and at the same time the most feared, of all the magistracies of Rome, the censorship. He had not canvassed for the office, but had only expressed his willingness to fill it. In compliance with his wishes Valerius Flaccus was chosen his colleague, as the only person qualified to assist him in correcting the public disorders, and restoring the ancient purity of morals. He fulfilled this trust with inflexible rigor; and though his measures brought him some obloquy and opposition, they met, in the end, with the highest applause; and when he resigned his office, it was resolved to erect a statue to him with an honorable inscription. He appears to have been quite indifferent to the honor; and when, before this, some one expressed his wonder that no statue had been erected to him, he answered, "I would rather have it asked why no image has been erected to Cato than why one has." Still he was not void of self-complacency. "Is he a Cato, then?" he was accustomed to say, when he would excuse the errors of another. Cato's political life was a continued warfare. He was continually accusing, and was himself accused with animosity, but was always acquitted. His last public commission was an embassy to Carthage to settle the dispute between the Carthagin-

ians and King Massinissa. It is said that this journey was the original cause of the destruction of Carthage; for Cato was so astonished at the rapid recovery of this city from its losses, that he ever after ended every speech of his with the well-known words, *Præterea censeo, Carthaginem esse delendam* ("I am also of opinion that Carthage must be destroyed"). He died a year after his return. Cato, who was so frugal of the public revenues, was not indifferent to riches. He was rigorously severe toward his slaves, and considered them quite in the light of property. He made every exertion to promote and improve agriculture. He was twice married, and had a son by each of his wives. His conduct as a husband and a father was equally exemplary. He composed a multitude of works, of which the only one extant is 'De Re Rustica.' Those of which the loss is most to be regretted are his orations, which Cicero mentions in terms of the highest encomium, and his history of the origin of the Roman people, which is frequently quoted by the old historians.

Ca'to, Marcus Porcius, called (to distinguish him from the censor, his great grandfather) CATO OF UTICA, Roman patriot: b. Rome 95 B.C.; d. Utica, North Africa, 46 B.C. He formed an intimacy with the Stoic Antipater of Tyre, and maintained through life the principles of the Stoic philosophy. His first appearance in public was against the tribunes of the people, who wished to pull down a basilica erected by the censor, Cato, which was in their way. On this occasion he displayed that powerful eloquence which afterward rendered him so formidable, and won the cause. He served his first campaign as a volunteer in the war against Spartacus, and highly distinguished himself. He served as military tribune in Macedonia in 67 B.C. When his term expired he went to Asia, and brought back the Stoic Athenodorus with him to Rome. He was made quæstor in 65 B.C., and executed his difficult trust with the strictest integrity, while he had the spirit to prosecute the public officers for their acts of extortion and violence. His conduct gained him the admiration and love of the Romans, so that, on the last day of his quæstorship, he was escorted to his house by the whole assembly of the people. The fame of his virtue spread far and wide. In the games of Flora the dancing-girls were not allowed to lay aside their garments as long as Cato was present. The troubles of the state did not permit him to remain in seclusion. The example of Sulla in usurping supreme power was followed by many ambitious men, whose mutual dissensions were all that saved the tottering constitution from immediate ruin. Crassus hoped to purchase the sovereignty with his gold; Pompey expected that it would be voluntarily conferred upon him; and Cæsar united himself to both and made use of the wealth of the one and the reputation of the other to attain his own objects. By keeping aloof from all parties Cato served the commonwealth with sagacity and courage; but he often injured the cause which he was trying to benefit by the inflexibility of his character. In 63 B.C. he was chosen tribune of the people. About this time the conspiracy of Catiline broke out. Cato supported Cicero, then consul, with all his power, first gave him publicly the name of "father of his country," and

urged, in a fine speech preserved by Sallust, the rigorous punishment of the traitors. He opposed the proposition of Metellus Nepos to recall Pompey from Asia, and give him the command against Catiline, and very nearly lost his life in a riot excited against him on this account by his colleague and Cæsar. After the return of Pompey he frustrated many of his ambitious plans, and first predicted the consequences of his union with Crassus and Cæsar. The triumvirate, in order to remove him to a distance, had him sent to Cyprus, of which he took possession on behalf of Rome (58-57). Compelled to obey, he executed his commission with so much address that he enriched the treasury with a larger sum than had ever been deposited in it by any private man. In the meantime he continued his opposition to the triumvirate. Endeavoring to prevent the passage of the Tribonian law, for investing the triumvirs with extraordinary powers, he was drawn into tumults, and even personal conflict. Being made prætor in 54 B.C., he carried into execution a law against bribery that displeased all parties. After the death of Crassus the civil commotions increased, and Cato, as the only means of preventing greater evils, proposed that Pompey should be made sole consul, contrary to the constitution, which proposition was adopted. The year following, 51 B.C., Cato lost the consulship by refusing to employ bribery to procure a majority. In 49 B.C. the civil war broke out. Cato, then prætor in Sicily, on the arrival of Curio with three of Cæsar's legions, departed for the camp of Pompey at Dyrrachium. He had always hoped to prevent the war by negotiation; and when it broke out he put on mourning in token of his grief. Pompey, having been victorious at Dyrrachium, left Cato behind to guard the military chest and magazine, while he pushed after his rival. For this reason Cato was not present at the battle of Pharsalia, after which he sailed with his troops to Cyrene, Africa. Here he learned that Pompey's father-in-law, Scipio Metellus, had gone to Juba, king of Mauritania, where Varus had collected a considerable force. Cato immediately set off to join him, and after undergoing every hardship, reached Utica, where the two armies effected a junction, 47 B.C. The soldiers wished him to be their general, but he gave this office to Scipio, and took command in Utica, while Scipio and Labienus marched out against Cæsar. Cato had advised them to protract the war, but they ventured an engagement, in which they were defeated, and Africa submitted to the victor. Cato had at first determined to defend himself to the last, with the senators in the place; but abandoned this plan, and despairing of the commonwealth, and unwilling to live under the despotism of Cæsar, resolved to die. On the evening before the day which he had fixed upon for executing his resolution, he took a tranquil meal, and discussed various philosophical subjects. He then retired to his chamber and read the 'Phædo' of Plato. Anticipating his intentions, his friends had taken away his sword. He sent for it, and in spite of the tears and entreaties of his friends persisted in his purpose, advised those present to submit to Cæsar, and dismissed all but the philosophers Demetrius and Apollonius, whom he asked if they knew any way by which he could continue to live without being false to his principles.

Weeping silently, they left him. He then received his sword joyfully, again read 'Phædo,' made calm inquiries for departing friends, slept awhile, and when left alone stabbed himself. His people rushed in, and finding him in a swoon bound up his wounds; but, on coming to himself, he tore off the bandages and expired. The Uticans buried him honorably, and erected a statue to him. Cæsar, when he heard the news of his death, exclaimed, "I grudge thee thy death, since thou hast grudged me the honor of sparing thy life."

Cato, the title of two noted 18th century plays: (1) A blank verse tragedy by Joseph Addison in five acts. It was first represented in 1713. The scene is laid in a hall of the governor's palace at Utica. The subject is Cato's last desperate struggle against Cæsar, and his determination to die rather than survive his country's freedom. 'Cato' owed its extraordinary success to the deadly hatred that raged between the Whigs and Tories at the time: the Whigs cheered when an actor mentioned the word "liberty"; and the Tories, resenting the implied innuendo, cheered louder than they. To the Whigs Marlborough was a Cato, to the Tories he was a Cæsar. Every poet of the time wrote verses in honor of 'Cato,' the best being Pope's prologue; and it was translated into French, German, and Italian. (2) A tragedy by Metastasio, 1727. The author follows closely the historic accounts of Cato's relations with Cæsar, and the details have more probability than those of Addison. He shows a decided superiority to Addison in making Cæsar the principal figure next to Cato, and placing them constantly in contrast with each other.

Cato Street Conspiracy, or **Thistlewood Conspiracy**, in English history, a plot formed in 1820 to murder the foreign secretary, Lord Castlereagh and other cabinet ministers, and to form a provisional government. The leader of the conspirators was Arthur Thistlewood. The plot was discovered and several of the conspirators captured, on 23 February, when they had assembled in a stable on Cato Street and were preparing to carry out their intentions. Thistlewood, who escaped, was arrested the next day. After a trial in which they were defended by John Adolphus, Thistlewood and four others were executed, and five were transported.

Ca'ton, John Dean, American lawyer and author: b. Monroe, N. Y., 1812; d. 1895. From 1855 to 1864 he was chief justice of Illinois. He published 'A Summer in Norway' (1875); 'The Last of the Illinois and a Sketch of the Potawatonnies' (1876); 'The Antelope and Deer of America' (1877).

Catop'trics, that branch of optics which explains the properties of incident and reflected light, and particularly that which is reflected from mirrors or polished surfaces. The whole doctrine of catoptrics rests on the principle that the angle of incidence is equal to the angle of reflection and in the same plane.

Catop'tromancy, a species of divination practised by the Greeks, in which a mirror was let down by a cord into a fountain in the temple of Ceres, in Achaia, into which sick persons looked. If the observer's face appeared in it sickly or ghastly the omen was considered unfavorable, and the sick person would not re-

cover; but if, on the other hand, it appeared fresh and healthy, the omen was considered favorable.

Catorce, *kä-tör'thā*, or *ka-tör'sā*, Mexico, a mining town of San Luis Potosi, which received its name, signifying 14, from a gang of robbers, formerly a constant menace to its inhabitants. It contains valuable silver mines, now pretty well worked out. The ore is mixed with sulphur, and requires treatment by a high degree of heat. When the French invaded Mexico, a mint was started here, and worked until 1867. The amount coined was about \$52,000,000. The population is variable, ranging from 10,000 to 18,000, according to the state of mining.

Catostom'idæ, a family of fishes of the order *Plectrospondyli* (q.v.), or, in a more limited sense, of the *Eventognathi*. They have the first four vertebrae coalesced and partly converted into a chain of bones reaching from the swim-bladder to the internal ear; the lower pharyngeal bones elongated and falcate, and bearing a row of numerous comb-like teeth; the jaws toothless and formed in part by the maxillary bone; the mouth usually small with thick protractile lips; the form more or less elongate and rounded or slightly compressed; and the fins soft, rayed with no adipose (rayless) dorsal fin. An extensive family of fresh-water fishes, chiefly of North America, where 12 or 14 genera and more than 60 species occur; in addition to which a very few are found in eastern Asia. Although abundant almost everywhere in the United States, none of the species have more than a local value as food fishes. To the *Catostomidæ* belong the suckers, buffalo-fishes, horse-fishes, certain so-called mullets, etc. (qq v.).

Cat'rail (also known as the PICTS' WORK or PICTS' WORK DITCH), the name applied to the remains of a large earthwork in Scotland, about 50 miles in length, which, beginning at Torwoodlee Hill, near the junction of the Gala Water with the Tweed, runs with a semicircular sweep southward through the counties of Selkirk and Roxburgh to a point under Peel Fell, in the Cheviots. The earthwork consisted of a deep ditch, with a rampart on each side, and varied in breadth from 20 to 26 feet. Various causes have resulted in the destruction of the ramparts in many places. The Catrail has led to much speculation.

Cats, Jacob, *ya'kōb kät's*, Dutch poet: b. Brouwershaven, Zealand, 10 Nov. 1577; d. Zorgvliet, near Scheveningen, 12 Sept. 1660. He studied at Leyden, Orleans, and Paris. In 1627 and 1631 he was ambassador to England, and in 1636 grand pensioner of Holland. His poetry is unimaginative, and didactic, but has been extremely popular with the Dutch middle class by whom he is frequently affectionately alluded to as "Father Cats." His works consist of allegories, according to the taste of his times, poems on the different ages and situations of life, idyls, etc. Among the most noted are 'Het Houwelick' (Marriage) (1625); 'Sinnen Minnebeelden' (1618); 'Trouringh' (1637).

Cat's-eye, the name given to several hard semi-transparent stones used as gems, which, when cut in a certain way, show a line of light giving what is called a *chatoyant* effect. The true cat's-eye is a chrysoberyl of a greenish color, found in Ceylon and Brazil. The line of

CATSKILL — CATSKILL MOUNTAINS

light shown when the stone is cut *en cabochon* is due to the structure of the crystal, or to included impurities. The common cat's-eye, of little value, is a crystalline quartz sometimes containing fibres of asbestos, which, cut across the fibres, gives a *chatoyant* effect. It is found in Bavaria. Tiger-eye (q.v.) also shows the chatoyancy of the cat's-eye. Beautiful tourmaline cat's-eyes, rivaling the oriental stones, have recently been found in California. Stones exhibiting the cat's-eye ray have been cut from various other minerals, including beryl, corundum, fibrous hornblende, bronzite, and hypersthene.

Catskill, N. Y., village and county-seat of Greene County, 30 miles southeast of Albany, on the west side of the Hudson River and on the West Shore and the Catskill Mountain R.R.'s; also connected with the New York Central by a ferry crossing the Hudson. It is a noted mountain summer resort and has a court-house, opera house, free academy, two national banks, several public schools, weekly newspapers, manufactories, and hotels. Pop. (1900) 5484.

Catskill Group, a name given to a great thickness of red, brown, green, and gray conglomerates, sandstones, and shales of which the Catskill Mountains are composed. Being well exposed by numerous cliffs and gorges, these deposits were carefully studied by the New York Geological Survey some 50 years ago. The rocks were believed to constitute a series, having a definite place in the classification of the Palæozoic rocks worked out by the Survey, and were given the name Catskill. Subsequent investigation has shown that the Catskill is not even to be called a group. It is simply a succession of shoal-water deposits of Upper Devonian age, that were laid down along one shore of an interior sea, while normal marine sediments, now represented by limestones, were being laid down elsewhere. Thus it happens that the Lower Catskill, of the Catskill Mountains, is represented elsewhere by limestones of the Hamilton stage, the Middle Catskill by the Portage, and the Upper Catskill by the Chemung. In the Catskill Mountains the so-called Catskill series is 4,500 feet thick; and where thickest, at Mauch Chunk, Pa., it is 7,500 feet thick. Farther south the rocks thin out and disappear altogether in Virginia. Though having no standing as a rock group, the Catskill is of interest from its many resemblances to the Old Red Sandstone of England, made famous by Hugh Miller, and is of economic importance from containing some beds of excellent flags, quarried at numerous openings in Ulster, Greene, and Delaware counties, N. Y., and sold as Hudson River bluestone. See DEVONIAN; OLD RED SANDSTONE.

Catskill Mountains. In the eastern part of the State of New York, facing the valley of the Hudson River, appears a group of mountains so singular in their formation, so exceptional in point of beauty of outline, that they have attracted universal attention since the day when the astonished crew of the Half Moon first saw their peaks rise above the primeval forests that lined the shores of the great river.

That part of the earth's surface now called New York is very old; so old, indeed, that it is difficult to guess at the age of the first rocky

islands that appeared above the ancient seas. The Highlands of the Hudson and the plateau of the Adirondacks may be among the oldest lands in the world. The interior of the State remained under the inland sea, that spread from the Hudson valley westward to the present Great Lakes for perhaps millions of years after these primal islands appeared. In time the surf, the rain, and the ice tore down these islands and spread the resulting sand, gravel, and mud far and wide over the sea floor, and in the course of ages filled up this inland sea so that it ultimately became dry land. This fact makes the interior of the State one of the most remarkable places in the world, for here the history of the earth is spread open as a page wherein can be easily read the progress of world-building. Fortunately the floor of the old sea has much of it remained undisturbed so that many successive pages can be seen in their original positions.

Men of science have divided the age of the earth's crust into four great "times," each an unknown number of millions of years long. The first is Eozoic Time, the pale, dim dawn-time before there was any life or before the first faint traces of the lowest life appeared. The second is Palæozoic Time, and this grand period is divided for convenience into three shorter "ages." The third is Mesozoic Time, also divided into three "ages"; and the last, in which we live, is Cenozoic Time. Looking far back to the beginning of the third age of Palæozoic Time we can imagine the southern and western border of the State a vast stretch of sandy bars awash or in the sea, vaster wastes of soft mud and oozy shoals of limey remains of marine life, great pebbly beaches and shingly bays and countless islands in the great muddy sea. The waters swarmed with fish, for the age of fishes was already old, and on the land already appeared the land plants, for the age of land plants was just beginning. To the south were vast tropic, fern-clad swamps that were to be turned later into the coal fields of Pennsylvania. To the north the far older parts of the State were perhaps already dry land or rapidly becoming so. Then, later, we do not know when, this vast track of half sea, half land, slowly turned to sandstones, shales, and slates. Still later, under the tremendous pressure caused by the gradual shrinkage of the earth's crust, it was pushed up into the air, and it now forms the great flat dome or plateau that extends along the southern edge of the State next the Pennsylvania line. Out of this interior upland, that slopes gently to the north, was thrust toward the east a narrow tongue of pale-blue shale or slate-like stone and gray and red sandstones that intruded upon the valley of the Hudson. The disturbance caused by the shrinkage of the earth was far more violent in the eastern part of the State than in the western part, as plainly shown by the present distorted positions of the water-formed rocks in the Hudson valley, and this tongue of newer stone was lifted high in the air. The upward pressure lifted the entire mass into the air perhaps without breaking it and leaving it slightly tilted downward or inclined to the west, a vast, wonderful plateau, a giant-wall of rocks unique among the stony annals of the world. To-day we look upon it in mingled wonder at such a page of world-history and admiration at the handiwork of the rain that has made of such a story-book so great a gal-

CATSKILL SCENERY.

BIG INDIAN VALLEY

ENTRANCE TO THE PLAATERSKILL CLOVE.

CATSKILL MOUNTAINS

lery of pictures. We call this open page of the earth's story "the Catskills."

The beauty of every landscape depends upon its port of view. A hill that seems commonplace from one side may have unusual grace and refinement when seen from another side. Herein lies the charm of the Catskills—they are fine from every side. Thrust forward into the comparatively level Hudson valley, they seem to stand quite alone between the Laurentian and far older mountains of the Highlands and the Adirondacks. The traveler approaching by boat or by rail on the eastern shore and from the south is surprised soon after leaving Poughkeepsie by sudden, blue elusive glimpses of dim forms, half cloudlike, upon the northern horizon. Then, for more than an hour, by rail, the mountains pass in grand procession, presenting at every mile new charms of peak and slope. In clear weather and, particularly in winter, the banded or stratified appearance of the eastern face of the range is readily seen, showing plainly that the Catskills are rocks laid down in the ancient sea. Moreover, those mile-long bands mark the ends of the stratifications, sharply broken off and making a remarkable wall or face, unlike the usual slope of other mountains, like the Adirondacks or the Highlands. The views from the West Shore Railroad are equally interesting, and are nearer and more neighborly. The approach from the north, by rail or boat, is also interesting, though it shows the grand panorama of peaks in a reversed order.

There are three routes by which the more settled or summer resort portion of the Catskills may be reached. Beginning at Rondout or Kingston, for the two towns are one, the Ulster & Delaware Railroad enters the Catskills by their southern gateway. Kingston can be reached by the West Shore Railroad or by boat, or by the New York Central Railroad at Rhinebeck and then by ferry to Kingston. On leaving Kingston the first foot hills soon appear, and at every mile the scenery becomes more wild, rough, and interesting. The mountains close in upon the narrow valley up which the road climbs through Stony Clove. This wonderfully beautiful entrance to the uplands of the Catskills is worthy of attention, because the outlines of the mountains on every side plainly show that the once comparatively level and uniform plateau has been carved out by erosion into its present form. It seems clear that these knife-like edges, steep slopes, valleys and peaks were carved out by the rain. They are "weathered" into the shapes they now exhibit. This will be still more evident in other places. After passing the Clove the road enters a comparatively level tableland and ends abruptly and with a grand surprise upon the sheer edge of the once giant table.

Another shorter, and in some respects more sensational, approach is by way of the town of Catskill. This point may be reached by the New York Central Railroad by taking the ferry at Greendale station, or by boat, or by the West Shore Railroad. At this point begins the short and most interesting ride over the Otis Inclined road, which runs west 10 miles from Catskill and, then by means of a cable, climbs directly up the face of the eastern wall. This is one of the most remarkable rides in the world, because the view, as the car ascends, gives at every turn

of the wheels a wider and wider view over the Hudson valley and, far away to the east, to the Berkshire Hills. The view from the top is already famous, having been often described, and is worth all the trouble of a long journey to see.

A third route, and the most instructive of all, is from Catskill by road up the Kaaterskill valley or Clove. The first 10 miles to the entrance to the valley is through a rolling, farming country, and should be carefully examined, because the winding road passes over three of the great pages of the earth's story-book. At Catskill, and for the first two or three miles, the road is over very ancient slates, mementos of the old Silurian sea that once covered the State. Chance exposures of these slates show that they have been very much distorted and bent out of their original horizontal positions by the terrific squeezing together caused by the shrinkage of the earth's crust. Leaving these slates we pass over ridges of younger limestones and then still younger slates and sandstones, and wherever exposed to view along the road all appear to be tilted up or having a slight slope to the west. All the time there are glimpses of the higher and far younger rocks of the Catskills, till at last the great banded gray wall rears itself before us as if to bar the way. Then follows the four-mile ride up the steep, winding road that leads to Haines Falls and the mountain top.

The most striking things about this wonderful valley road are the views it gives of the stony skeleton of the mountains. At the very gateway of the Clove we can see a sheer wall of the rock from its smooth water-worn base in the brawling brook up to the topmost shelves of rock that seem ready to fall into the deep valley below. Here is the open page of the Catskill story. We can see the hands of rock laid down through the ages. Some are hard and, resisting the weather, stand out in overhanging sheets. Others are softer and are hollowed out, and appear to be crumbling into thin, slaty fragments. Nowhere in the eastern part of the State can be seen a more remarkable exhibit of stratified rocks showing every change of the seasons and years through which these muds, sands, and gravels were laid down in the old sea. Added to this historic interest of the ride is the wonderful and ever-increasing beauty of the mountains, the woods and stream. The green walls of forest close in on every side, and at each turn of the road new beauties of slope and crag appear, till the journey ends at the very point of the grand cañon as we cross the bridge above the roaring falls, and are in the uplands of the Catskill plateau. From the residence park at the head of the cañon are magnificent views down the narrow valley and out over the wide sunny valley of the Hudson 2,000 feet below.

The Catskills have no commercial value. They are unfit for farming purposes, and are clothed with forests, once very valuable, but now ruined by the too greedy lumbermen, and of only slight present value. The whole range is a comparatively useless wilderness. The rocks themselves have some value, for the mountains are one vast storehouse of bluestone. A wilderness, it is true, but a great and precious heritage for all the people. The Catskills make one of New York's greatest assets, for they are at once a summer home, a sanitarium, and vast

people's camping and forest park. It is something that so magnificent a prospect as that from the top of the eastern wall is in easy reach of the city of New York. It is something that so much of beauty of mountain and valley are in sight of a dozen towns, and in sight of the thousands passing up and down the Hudson valley. A wilderness, perhaps, but a precious wilderness to be forever preserved for the delight and instruction of the people of this country.

The chief impression left upon the mind of the visitor at the Catskills is wonder that a once great and probably level plateau should be carved into such sharp peaks and cañon-like valleys. Could the rain have carved out the rocks to these forms? The rain and the frost, aided by the peculiar slaty character of the rock, undoubtedly did in the long centuries carve the great plateau into its present mountain-like form. Part of the rock is comparatively soft, all of it is full of fissures and readily splits apart under the expansion of ice formed in its fissures. It is quite possible that all of it was once softer and more plastic than now, and the process of tearing down by ice and floods may have been more rapid than at present. However this may be, it is clear that the Catskills are the true children of the rain, whose soft persuasive fingers carved the plateau into its present beautiful mountains and spread the broken wastage far and wide over the country below. In this work of the weather we have also to recognize that the glaciers of the Ice Age may and probably did largely help in the work of modeling the mountains. The great heaps of glacial rubbish at the lower entrance of the Stony Clove valleys would indicate that a vast amount of rock was removed during the time when the plateau was covered with ice. The floods that followed the melting of the ice also helped in the work of carving the peaks and cañons that we so much admire to-day.

CHARLES BARNARD.

Catt, Carrie Lane Chapman, American suffrage reformer: b. Ripon, Wis. She was educated at the State Industrial College of Iowa and subsequently studied law. She was for three years principal of the High School at Mason City, Iowa, and in 1884 was married to Leo Chapman, editor of the *Mason City Republican*, who died some two years later. Since 1890 she has devoted herself to woman suffrage work, lecturing frequently in behalf of the movement, and as chairman of the National Organization Committee doing very much to place the reform on a substantial basis. She has been associated in recent years with nearly all of the important gains which have been made in this direction, and the carrying of several state amendments relating to equal suffrage has been attributed to her influence. In 1891 she was married to G. W. Catt (q.v.). She was elected president of the National American Woman Suffrage Association in 1903.

Catt, George William, American civil engineer: b. Davenport, Iowa, 9 March 1860. He was educated at the Iowa State College and subsequently studied engineering and law. He was chief engineer of the San Francisco Bridge Company, 1887-92; president and engineer of the New York Dredging Company, 1893-9; and president and engineer of the Atlantic Gulf & Pacific Company from 1899. He has built government dry docks at the navy yards at League Island, Philadelphia, and Mare Island, California.

Cattaro, kät'tä rö, Austria, a seaport in Dalmatia, at the foot of the Gulf of Cattaro, on the east side of the Adriatic, 38 miles southeast of Ragusa. It lies at the foot of steep limestone rocks, strongly fortified and surmounted by a castle, and is surrounded with walls. The buildings are in the Venetian style, and the streets are narrow, irregular, and dark. It is the seat of a Roman Catholic bishop, and the cathedral is a well-built edifice. The harbor is spacious, but there is not much trade. Pop. (1903) about 6,000.

Cat'tegat, a gulf of the North Sea, between North Jutland to the west, Sweden to the east, and the Danish islands of Zealand, Funen, etc., to the south; about 150 miles from north to south, and its greatest breadth about 60. It is difficult of navigation, being not only shallow toward the shores, and irregular in depth, but obstructed by several sand-banks, and the adverse winds which often prevail here increase the danger. The Cattegat is noted for its herring-fishery. It contains the islands Samsoe, Anholt, Læsø, and Hertzholm.

Cattell, James McKeen, American psychologist: b. Easton, Pa., 25 May 1860. He graduated at Lafayette College in 1880, and studied at Leipsic, Paris, Geneva, and Göttingen. He was assistant under Wundt at the University of Leipsic, professor of psychology in the University of Pennsylvania in 1888-91, and became professor of experimental psychology in Columbia University in 1891. He is co-editor of the 'Psychological Review' and 'Science.'

Cattell, William Cassidy, American educator: b. Salem, N. J., 30 Aug. 1827; d. Philadelphia, Pa., 11 Feb. 1898. He was graduated at Princeton in 1848, and at Princeton Theological Seminary in 1852. He was professor of Latin and Greek in Lafayette College, 1855-60, and president of that institution, 1863-83, and subsequently prominent in the Presbyterian Church.

Cat'termole, George, English water-color painter: b. Dickleburgh, near Diss, Norfolk, 8 Aug. 1800; d. Clapham, Surrey, 24 July 1868. Like Turner and William Hunt, he started in life as a topographical draughtsman, and was employed as a draughtsman on Britton's 'English Cathedrals' when only 16. He drew the designs for the illustrations of various annuals, the *Waverly Novels*, for an edition of Shakespeare, and for his brother's 'History of the Civil Wars.' In 1833 he was elected a member of the Society of Painters in Water-colors. He was a member also of the Academy at Amsterdam, and of the Belgian Society of Water-color Painters. He obtained a medal of the first class at the Paris Exhibition of 1855. In 1851 he resigned his membership of the English Society, and devoted himself to oil-painting. Among the best known of his pictures are 'Hamilton of Bothwellhaugh about to Shoot the Regent Murray'; 'Luther at the Diet of Spire'; 'The Armorer's Tale'; 'A Terrible Secret,' etc.

Catti, kat'ti, one of the most renowned and valiant of ancient German tribes, inhabiting what is now Hesse, also part of Franconia and Westphalia. They carried on bloody wars with the Hermunduri and Cherusci. In the time of Cæsar they dwelt on the Lahn, and

“ROUNDING UP” CATTLE ON A GREAT WESTERN RANCH.

CATTLE—CATTY

opposed him with effect. Drusus defeated without reducing them. In the reign of Marcus Aurelius they made incursions into Germany and Thrace, but were afterward defeated by Didius Julianus. In 392 they made their last appearance in history in union with the Franks. According to Cæsar, their territory was divided into 100 districts, each of which was obliged to send annually 1,000 men into the field, whose place was supplied the following year by those who had before remained at home to cultivate the ground. Their food was milk, cheese, and game; their dress the skins of animals. Their limited princes, who governed in connection with a diet, annually distributed the lands among the families.

Cattle, a term of rather indefinite use, but usually referring to domestic animals of the bovine family, more specifically termed oxen. The various domestic races will be found treated under BUFFALO, DAIRYING, DOMESTIC ANIMALS, and OX; wild oxen under AUROCHS, BISON, BUFFALO, URUS, etc.

Cattle Feeding. See NUTRITION OF FARM ANIMALS.

Cattle-plague, any plague by which large numbers of cattle are destroyed. Such plagues have existed at intervals, more or less, in all countries and in all ages. Among the severer visitations in centuries preceding the 19th may be mentioned a great plague which arose in Hungary in 1711, whence it spread to other countries, destroying in the next three years about 1,500,000 head of cattle. A second visitation, which affected England and the west of Europe between 1745 and 1756, caused the death of 3,000,000 cattle. See RINDERPEST.

Several of the diseases of cattle are due to insects, including that called "pleuro-pneumonia" or "Texas cattle fever," which is caused by a blood-inhabiting sporozoon that is carried by ticks from an infected animal to a healthy one, communicating the disease. Cattle bred in the southern States have become practically immune, but the disease affects and kills northern cattle. The natural limit of the tick concerned (*Boophilus annulatus*) nearly coincides with Mason & Dixon's line, and federal laws prohibit the shipping north of any cattle from south of this line, except between 15 November and 15 February. Other species of this same genus of ticks transmit similar cattle diseases in various parts of the world, especially the "blue tick" (*B. decoloratus*) of South Africa. The remedy is to dip the cattle in vats of cotton-seed oil or some similar mixture. See CATTLE-TICK.

The appellation "cattle-plague" is also loosely given to another disease among cattle in the United States, which is otherwise known as "lumpy-jaw," a most virulent and incurable affection. Experiments have been time and again ineffectually tried to find a cure for this, though large governmental encouragement has been offered. A rigid examination of cattle is made by government inspectors at all receiving and shipping ports.

Cattle-tick, or **Texas-fever Tick**, an arachnid (*Boophilus annulatus*) related to the mites, and prevalent in the western and southwestern States. It is a reddish, coriaceous, flattened, or swollen creature from a quarter to half an inch

in length. The cattle-tick lays a great many eggs, nearly oval, dark-brown, coated with a hard secretion, the process of egg-laying lasting for several days or a week. The young tick, on hatching, is whitish, afterward turning brown; it has three pairs of legs. After molting it becomes a nymph, when the fourth pair of legs is added. During the nymph stage the reproductive organs develop. After another molt it becomes sexually mature. It completes its development from the larva to the adult on cattle. After this second molt the couple pair, and the male grows but little. The female, voraciously feeding on the blood of her host, grows to a gigantic size, her body swelling and becoming gorged with blood and eggs. The males can be easily detected by their smaller size, and by the extension of the shield over the entire back. Ticks live upon the blood of their host. The females, as they increase in size, store away quantities of the ingested food in an immense convoluted chamber or appendage of the stomach. In summer only three or four days after the final molt are necessary for the ticks to become large. When fully gorged, and the eggs have become fertilized, the female loosens her hold in the skin of her host, and falls to the ground, where she lays her eggs, after which her body contracts, shrivels up, and then dies. The young ticks get access to cattle by climbing bushes, whence they reach out and attach themselves to passing animals.

It has been proved that ticks, by sucking the blood of cattle infested with the Texas fever germ, which is a sporozoon (*Apiosoma bigemum*), may communicate the disease (bovine malaria) to healthy cattle, just as the sporozoan blood-parasite of yellow fever, or of malaria, is communicated by a mosquito (*Anopheles*). In dealing with ticks it should be remembered that it breathes by spiracles, or minute holes in the sides of the body. By the use of oil, or any greasy substance, those openings may be covered, thus asphyxiating the creature. The ticks may thus be killed by dipping or spraying the cattle with cotton-seed oil. Cattle should be kept away from wooded or bushy pastures.

There are one or two forms very closely allied to the Texas cattle-tick, and named *Boophilus australis*; they are regarded by experts as either distinct varieties or species from *B. annulatus*. They transmit the cattle-fever in the countries above named. Another sub-species or variety, the blue tick (*B. decoloratus*) in South Africa transmits the same disease in that region.

The Lone Star tick (*Amblyomma unipuncta*) is, next to the cattle-tick, to be held responsible for the transmission of the Texas fever. It may be recognized by the simple bright silver spot on the back.

Consult Curtice, 'The Cattle-Tick' ('Journal of Comparative Medicine and Veterinary Archives' 1891-2); Salmon and Stiles, 'Cattle-Ticks of the United States' ('17th Annual Report of the Bureau of Animal Industry,' Washington, 1902).

Catty, a standard of weight in China and the Malayan Archipelago. In China, the Straits Settlements, Java, British North Borneo, etc., it is approximately one and a third pounds. The Siamese catty is equal to 2.675 pounds.

CATUBANGANES — CAUCASUS MOUNTAINS

Catubanganes, *kâ-too-bân gans'*, or **Catabangenes**, warlike tribes settled in the mountains of Guinayangan, in the province of Tayábas (Luzon). Through lack of available information nothing can be said about their race affiliations, whether they be pure Malay or Negrito-Malay. They are probably Remontados mixed with Negrito blood and gone wild.

Catubig, *kâ-too-bîg'*, Philippines, a small town in the island of Samar, 48 miles north of Catbolagan. The place is garrisoned by United States troops, who, in June 1900 withstood an attack by 600 insurgents. This episode was a stirring incident of the war. Pop. 9,565.

Catullus, Valerius (whose prænomen is stated by some to be Caius, by others Quintus), Roman poet: b. Verona 86 B.C.; d. after 47 B.C. He went in his youth to Rome, where his accomplishments soon won him the favor of those who adorned that splendid era. He was the friend of Cicero, of Plancus, Cinna, and Cornelius Nepos; to the last he subsequently dedicated the collection of his poems. This collection is not of great extent, but shows what he was capable of doing in several kinds of poetry, had he preferred a steady course of study to pleasure and traveling. Probably a part of his poems have not come down to us. Of the merit of his productions there has been but one opinion among the ancients as well as moderns. Tibullus and Ovid eulogize him; and Martial, in one of his epigrams, grants to him alone a superiority over himself. In sportive composition and in epigrams, when he keeps within the proper limits of that species of poetry, he is a model. He succeeded also in heroic verse, as in his beautiful episode of Ariadne, which appears to have inspired the poet who afterward sung of Dido. He was the first of the Romans who successfully imitated the Greek lyric poetry. The four odes of his that remain to us make us feel a lively regret for the loss of the others. A weighty objection, however, against most of his writings, is their licentiousness and indelicacy. The common opinion is that he died 57 B.C., in the 30th year of his age, but this is no doubt erroneous, as there are allusions in his own works which prove him to have been alive in the consulship of Vatinius, as late as 47 B.C. Scaliger maintains, but without sufficient proof, that he died in his 71st year. An excellent English translation of Catullus in the original metres is that of Robinson Ellis, who has also published an admirable annotated edition of the Latin text (1878).

Cat'ulus, Quintus Lutatius, Roman general, historian, and poet: b. about 152 B.C.; d. 87 B.C. He was consul in 102 B.C. with Gaius Marius, and in the following year was proconsul. During his proconsulship he, with Marius, defeated the Cimbri near Vercellæ, the modern Vercelli, in northern Italy. As one of the aristocratic party and a partisan of Sulla, he was proscribed by Marius. With the exception of two epigrams nothing of his work has survived.

Caub, *kowb*, Prussia, a town in the province of Hesse-Nassau, on the Rhine, 30 miles west-northwest of Wiesbaden. Here Blücher crossed the Rhine with his army, 1 Jan. 1814, and here, too, till 1866, toll was levied by the Duke of Nassau—the only ruler who kept up

this feudal privilege—from vessels navigating the Rhine. Caub has slate quarries, and opposite, on an island in the river, where Louis le Débonnaire died in 840, is a castle called the Pfalz, built in 1326, which is said to have been resorted to for safety by the Countess Palatine. In 1876 and 1879 Caub was the scene of two serious landslips.

Cauca, *kow'kâ*, Colombia, one of the nine departments of the Republic, bounded on the northwest by Panamá; on the north by the Caribbean Sea; on the east by the departments of Bolívar, Antioquia, Tolima, and Cundinamarca, and the Republics of Venezuela and Brazil; on the south by Brazil and Ecuador; on the west by the Pacific Ocean. The territory of Caquetá and the districts of Huila, Inzá, and Páez are included in this department. The eastern part of Cauca is watered by the Amazon and some of the affluents of that river; the Guaviare and the Casiquiare flow into the Orinoco; the Atrato empties into the Gulf of Urabá; while a dozen smaller rivers flow into the Pacific. On both the Caribbean and Pacific coasts there are several ports. For area, population, etc., see COLOMBIA.

Cauca, a river in Colombia, South America, an important tributary of the Magdalena; length, 600 to 700 miles. Its course is mainly northerly, and it forms many waterfalls. It gives its name to the largest department of Colombia.

Caucasian (*kô-kâ'shan*) **Race**, a term introduced into ethnology by Blumenbach, in whose classification of mankind it was applied to one of the five great races into which all the different nations of the world were divided. Blumenbach believed this to be the original race from which the others were derived, and he gave it the epithet of Caucasian because he believed that its most typical form—which was also that of man in his highest physical perfection—was to be met with among the mountaineers of the Caucasus. The physical superiority of these people is scarcely maintained at the present day, but the name is still retained in classifications. The Caucasian race comprises the most highly civilized nations of the world, including most of the inhabitants of Europe (the Turks, Hungarians, and Fins being excluded); the Hindus, Persians, Arabs, Hebrews, and the ancient Phœnicians of Asia; and a large proportion of the inhabitants of northern Africa. See ETHNOLOGY.

Caucasus Mountains, a lofty and rugged range of mountains forming one of the natural barriers between Europe and Asia. It extends in a northwest and southeast direction from near the strait of Kerch on the Black Sea to near Baku on the Aspheron peninsula projecting into the Caspian Sea. The distance between these points in a straight line is 700 miles, but following the main ridge of the mountains about 940 miles. The range varies in width from 30 to 130 miles, and may be divided into three parts. The western portion, extending from the Strait of Kerch and the Sea of Azov to the peak of Elbruz, consists of a series of parallel ridges of stratified rocks, the ridges apparently formed by huge, tilted fault blocks. The northern slopes of the northern ridges rise rather gently out of the plain of Caucasia; the southern slopes, along the fault

planes, are abrupt; and the southern slope of the main ridge has in places almost vertical walls 2,000 to 3,000 feet high. There are few passes through this great barrier, and these are difficult. The snow line is at about 9,000 feet.

The highest peaks of the Caucasus are in the central part, from Elbruz to the Adai-Khokh. Here, as to the westward, is a series of parallel ridges, the higher summits all snow-clad, with deep longitudinal valleys; but some of the highest peaks, Elbruz and Kazbek, are on spurs more or less isolated from the main range. In this central portion of the Caucasus, as yet but incompletely mapped, there are said to be fully 20 summits higher than Mont Blanc, the highest peaks being Elbruz, 18,470 feet; Dykhtau, 17,054 feet; Koshiantau, 16,881 feet; Janghitau, 16,564 feet; and Kazbek, 16,546 feet. The snow line is at about 11,500 feet, and the total number of glaciers of the first class is fully 175, while rounded rock surfaces and boulders in the valleys show that glaciation was much more extensive at no very distant time. East of Kazbek the range narrows and is narrowest south of Vladikavkaz, where it is crossed by the Russian military road to Georgia. This road runs over the Kobi Pass and through the great Davial gorge, one of the greatest mountain chasms in the world. The eastern part of the Caucasus, from Kazbek to the Caspian, is of much more complicated structure: the range widening and including a high plateau crossed by subordinate ranges having an east-northeast and west-southwest direction, though what may be termed the main axis continues its southeast course.

The plains of Caucasia north of the mountains are underlaid by Tertiary and Quaternary strata. The foot hills of the western Caucasus and the plateau of the eastern Caucasus show rocks of Cretaceous and Jurassic age, and nearer the main axis of the range are Paleozoic formations. The main axis shows schists and gneisses with granite and syenite. Trachyte and similar rocks occur, and some of the peaks, Kazbek, are probably in part of volcanic origin.

The scenery of the Caucasus is wild and gloomy rather than beautiful. The lower slopes are thickly wooded, but there is not the combination of dark forests, beautiful lakes and graceful snow-crowned summits that makes some ranges—for instance the Selkirks in British Columbia—so attractive to the mountaineer.

The mineral wealth of the Caucasus is very great; in fact, in this respect the range is one of the most noteworthy in the world, but owing in part to the very rugged topography much of this wealth is still undeveloped. Among the valuable resources may be named the coal fields near Ochetchiri and at Kuban and Kutais, the copper mines of Tiflis and Elizabetopol, and the silver ores of Terek and Kutais. More important are the manganese mines near Kutais, whence some 500,000 tons of ore were exported in 1900 to various European countries and the United States. Most important of all are the oil wells of the Aspheron peninsula, the most remarkable in the world, whence some \$12,000,000 worth of petroleum, benzine, etc., were shipped to foreign countries in 1900. Consult: Bodenstedt, 'The People of the Caucasus'; Deniker, 'Races of Man'; Keane, 'Man, Past and Present'; Ripley, 'Races of Europe.'

Cauchy, Augustin Louis, ô-güs-tân loo-ë kö-shë, French mathematician: b. Paris 21 Aug. 1789; d. there 23 May 1857. He published in 1815 a 'Treatise on the Theory of Waves,' which was afterward made the basis of the undulatory theory of light. Between 1820 and 1830 he wrote several important treatises, and at Prague, where he resided as tutor to the Comte de Chambord, he published his 'Treatise on the Dispersion of Light' (1837). From 1848 to 1852 he was professor of astronomy at Paris, but refused the oath of allegiance to Napoleon III., and lived in retirement till his death. See 'Life,' by Valson (1868).

Caucus (short for "caucus club"), a political party gathering for nominations or conference on party policy, as distinguished from a merely hortatory one. It may be a town or ward meeting, to nominate local candidates or delegates to higher nominating conventions (the latter sort are also called "primaries"); or a party conference of members of Congress or a legislature, to decide on members or confirmations to office. Originally, a secret gathering on the model of the Caucus Club of Boston, whose leading business was the making of "slates" for local offices, and incidentally came to be the molding of a policy of local autonomy in opposition to British influence. The etymology of the name is pure guesswork. The usual derivation from "caulkers" (sc. club), or an imaginary "caulk-house," is most improbable. More plausible would be that from Lat. *caucus*, Gr. *kaukos*, a cup, as originally a convivial society, most secret societies of that day having classical names or initials; the words, however, are not classical, but mediæval, and so are less likely to have come under their notice. Possibly, though not probably, it is mere alliterative comic jargon. Most probable of all is the adoption of an Algonkin word, *kaw-kaw-wus*, to consult:—if the word is real: cf. "pow-wow." At all events, the club and the elements of the system originated in Boston during the 18th century. Samuel Adams' father was accredited as a founder and eminent master of the art, in which his son became immortal, and to which he owed his first election to the legislature. The preparation and distribution of ballots before the election was one of its chief instrumentalities. The first mention of the original club is in John Adams' diary, February 1763: he says the town officers are "regularly chosen there before they are chosen in the town," and intimates that the distribution of business favors as a *quid pro quo* was not absent, which might be assumed.

The system rapidly grew; indeed, in some form it is part of the inevitable machinery of majority rule, which in constitutional countries has supplanted the primitive decision of battle by merely counting the opposing hosts, it being assumed as a basis that the larger could outfight the smaller. But for common action of that majority there must be some method of determining its will before the elections, as to both measures and men; and all countries with any measure of popular control have some shaping and testing mechanism of the sort. In England it has been formally established since 1880, by the so-called "Birmingham system"; but in the higher lines of policy, even before that, the two great political clubs of London, the Carlton and the Reform, Conservative and Liberal, discharged much of the functions of

CAUCUS

informal caucuses. Nevertheless, the power of the caucus is greatly affected by local and national circumstances. In England and most continental countries, it is restrained by the still powerful aristocratic system, which forms a counterpoise and provides natural leaders; in France, by the centralized government system. In no other country has it the same authoritative power as in the United States. Early in our history it became universal. Said Adams in 1814: "We have Congressional caucuses, State caucuses, county caucuses, city caucuses, district caucuses, town caucuses, parish caucuses, and Sunday-school caucuses at the church doors." This is primarily due to the entire legal equality of all classes; that absence of prescriptive privileges furnishing a shelter for minorities and independent action, which is considered the chief glory or the chief danger of democracy, according to the point of view. The gradations of the American political system into national, State, district, and municipal powers have produced a corresponding hierarchy of caucuses, each sending delegates to the next higher caucus or convention, and constituting a "machine" of great efficiency and formidableness.

But it has been made at once practically irresistible, and largely worthless for its ostensible purpose of determining the general sentiment of the party, by the "spoils system," which throws the organization and management of the caucuses into the hands of those who can give their whole time to political work, because paid for this service (in reality though not in name) out of the public treasury. Thus managed, the caucus in the larger places does not necessarily represent the views of the majority, and very often the leading object is to prevent the majority from meddling with the machine. In theory, the caucus being a voluntary association of the members of a voluntary association, to deliberate as to its policy and agents, all are fairly bound by its decisions, and have no right to "bolt" afterward; otherwise there is an end of all common action. It is of course to the interest of the managers to cultivate this theory, and the military smiles of "campaigns" and "forces" and "deserters" and "closing up ranks," etc., and to stigmatize all individual courses as equivalent to treachery and insubordination; and no matter how spurious this technical majority may be, or by what methods a real minority may have attained a seeming vote of confidence, a "regular" nomination will always have enormous weight. In part, it is true, this is because the vast majority have no common wish or purpose, and are destitute of constructive political ideas; and any pronouncement of the constituted party authorities is really their will, which is simply to obtain such a mandate. Hence, "regularity" is the test of merit; and this willingness to accord to the show what belongs to the substance is the almost invincible bulwark of political corruption.

This has generated in the last few years a host of efforts, public and private, to break down the monopoly of the caucus and substitute a real and direct control of nominations by the party; control of policy cannot thus be shifted, but corruption is the work of men, not of measures. It cannot be said that any of these movements as yet are very successful or promising, largely owing to the consideration just

mentioned, that the initial possession of political ideas is a condition precedent to expressing them. One scheme is to have nominations made by direct popular vote instead of by primaries, but this simply shifts the function of the caucus one stage back, to decide on the votes for nomination instead of the votes for offices. More elaborate, and in some directions more efficient, are the legislative provisions made in several States for taking the primary caucuses themselves under the control of the law, as elections have always been. In this case, all persons who wish to vote in a party caucus must register themselves as members of that party. The effects of this measure have been a singular mixture of good and evil, and probably reflect in this regard the motives of the enactment. On one hand, faction leaders can no longer swamp a caucus with a rabble of purchased voters from the lowest element of the other party. In theory a check list was always used; but as it had no legal validity, it was scouted whenever a majority, real or spurious, was interested in evading it. The check list under the law cannot be so treated. On the other hand, an obvious effect of the law, probably not absent from the minds of the framers, is to extinguish as a party force the independent or "mugwump" element of both parties, who try to reform their own party by a leverage obtained from the other; and are therefore excluded from either, as they cannot keep changing registration. If this was a motive, the Nemesis has been speedy. The party managers in various places are greatly disappointed and alarmed to find that only a fraction even of their normal and calculable voting strength will register at all, and therefore they are nominating in the dark, without knowing what the party sentiment is. When they honestly wish to ascertain the party feeling, they have great difficulty in doing it. The dislike to sporting a registered, public, and unchangeable party label is not confined to the more intellectual independents, but is strong in the general mass; and the attendance at primaries is a much less sure guide than of old to what the party will support at the polls. The precise future of the caucus cannot be forecast; but there is little evidence thus far of a loosening of its hold.

Congressional Caucuses for President and Vice-President.—These grew out of the Electoral system (see ELECTORAL COLLEGE), and perished, significantly, at the same time that the old theories of an educated official class and professional trained office-holders gave place to the inrush of the untrained democracy and rotation in office. It is no mere coincidence that the last Congressional caucus was held to nominate a candidate in the last election that returned a President of the old school. The masses were taking everything into their own hands; Jackson and popular nominations came in together, though there was one intermediate link when the people acted through the State legislatures. The theory of the Electoral system was that the electors, themselves the chosen sages of the people, should make free choice of the best men in the country for the chief executive offices; but from the first their choice was pointed out in advance. While Washington lived and would take office, no other candidate for President was possible; and for his first Vice-President, John Adams was the choice of New England,

CAUDA-GALLI GRIT — CAUDLE'S CURTAIN LECTURES

and the other States had either their "favorite sons" or no special wish. In 1792 the same circumstances controlled; though New York's favorite, George Clinton, won the support of several southern States. The electors deferred to the notorious public feeling; but their action was nominally independent. In 1796 this was still true of the Federalists, who made a combination of North and South on Adams and Pinckney; it was substantially true of the Republicans, for Jefferson was the undisputed leader, and while the Republican members of Congress informally agreed to support Burr, there was no set ticket for the electors to support at party peril. But in 1800 both parties held regular but secret caucuses, and adopted tickets which the electors voted solidly and even stupidly, with results still memorable. The Federalists voted that Adams and Pinckney should be supported alike. The point of this was that up to that date, there was no distinct candidate for President and Vice-President, the one who received the largest electoral vote being President and the next one Vice-President. Adams was certain to receive no Republican votes; but if all the northern Federalists voted for Pinckney, he as a popular Southerner would probably receive some stray votes from that section, and so be elected President over Adams, whom the Federalists hated but did not wish to bolt. Thus they would defeat him by appearing to keep strict party faith. The Republicans on their part held a caucus, and made a similar agreement with regard to Jefferson and Burr; not with similar designs, but to placate New York, which complained that her candidates were "knifed" in the South. Of course in both cases, if the whole electoral body voted "straight," there would be a tie and no election. This actually happened in the case of Jefferson and Burr, and the struggle was only settled after 36 votes. The results were the adoption of the Twelfth Amendment to the Constitution, regulating presidential elections and compelling electors to state which candidate was to have which office; the implacable hostility of Jefferson to Burr, which killed the chance of the latter to rise further in his party, drove him into the arms of the Federalists, and ultimately ended in the murder of Hamilton; and as the presidential electors had simply voted the tickets dictated by the party representation in Congress, they instantly became as they have ever since remained, nullities. The second occasion was on 29 Feb. 1804, when the Republicans (in open, not secret caucus) renominated Jefferson; they dropped Burr for George Clinton (New York still keeping the place), by 67 votes to 20 for Hugh H. Breckinridge of Pennsylvania, and some scattering. The Federalists held no ostensible caucus; but as they were scheming to support Burr for governor of New York, and with that prestige nominate him for President, the plan must obviously have been agreed on in what served the purpose of caucuses. Burr's killing of Hamilton spoiled this scheme, however: they nominated Pinckney and King, and were almost annihilated. The third caucus was on 23 Jan. 1808, also by the Republicans; but only two thirds of the party members attended, as the conclusion was foregone. Madison and Clinton were nominated. Meantime the Virginia legislature had split into Madison and Clinton

factions, the former much the stronger; nominated separate sets of electors and carried the quarrel into Congress, where Monroe's party issued a manifesto protesting against both Madison and Congressional caucuses. The Federalists held none, and renominated their previous candidates. On 18 May 1812 the Republican or Democratic party held its fourth caucus, and renominated Madison on his express agreement to declare war against Great Britain; also nominating Elbridge Gerry for Vice-President. This time they appointed a national committee to see that the nomination was respected. The New York Democrats, however, were very restive under the "Virginia dynasty" and the "secretary of state dynasty"; and their members of the legislature held a caucus, nominated George Clinton, and protested against the Congressional caucus as always nominating a Virginia candidate. A secret caucus or convention of Federalists was held in New York in September, adopted the Clinton nomination, and nominated Jared Ingersoll for Vice-President. On 29 March 1816 the Democrats, now practically the only existent party, held the last caucus which accomplished anything. Henry Clay and another member introduced resolutions that the caucus nominations be abolished, but were voted down; and Monroe was nominated, by no great margin over Wm. H. Crawford of Georgia. Daniel D. Tompkins of New York was nominated for Vice-President. In 1820 a caucus was summoned, but only about 50 members responded, and they took no action. The general feeling was now strong against the system, as there was but one party, and a nomination by Congressional caucus was equivalent to allowing Congress to appoint the President and Vice-President. In 1824 several State legislatures passed resolutions forbidding the State representation in Congress to attend a caucus if one were called. But the Crawford party, who wished to give his nomination the prestige of a national verdict, held one at which about a fourth of the members attended, and nominated him and Albert Gallatin. It can hardly have gained him much support, however, and a paralytic stroke finished whatever chance he might have had. In the next (1828) campaign, the State legislatures made the nominations; and in 1832 the nominating convention was introduced. See UNITED STATES — BEGINNINGS OF PARTY ORGANIZATION.

Cauda-galli Grit, or Esopus Shale, one of the basement members of the Devonian System in New York and New Jersey. The name ("cock's tail") is from a characteristic fossil, supposed to be a seaweed.

Caudex, in botany, the stem of a tree, more especially the scaly trunk of palms and tree-ferns. It often appears as a rhizome running along the surface of the earth or underground.

Cau'dine Forks, a pass of southern Italy, in the form of two lofty fork-shaped defiles, in the Apennines (now called the valley of Arpaia), into which a Roman army was enticed by the Samnites, 321 B.C., and being hemmed in was forced to surrender.

Cau'dle's Curtain Lectures, Mrs., a series of humorous sketches by Douglas Jerrold (q.v.).

Cauer, Emil, ä'mēl kow'ēr, German sculptor: b. Dresden 29 Nov. 1800; d. Kreuznach 4 Aug. 1867. He studied at Berlin under Rauch and at Munich under Haller; in 1825 he went to Bonn where he was instructor in art at the university; in 1832 he was appointed drawing master at the gymnasium at Kreuznach. Among his best works are 'Sickingen'; 'Charles V.'; 'Melanchthon'; and the representations of Red Ridinghood and other fairy tale characters. He also restored the antiques in the museum at Dresden.

Cauer, Karl, German sculptor: b. Bonn 14 Feb. 1828; d. Kreuznach 17 April 1885. He studied with his father, Emil Cauer (q.v.), and with Wolff in Berlin; he also visited London several times in order to study the Parthenon friezes. Among his works are the Schiller monument at Mannheim, 'The Witch' and a number of portrait busts. In his later life he became interested in the question of coloring sculptures, and made a number of experiments in that line.

Caughnawaga, kô-nä-wä'ga, Canada, a town in the province of Quebec, situated on the St. Lawrence River, near the Lachine Rapids, opposite Lachine. It is an Indian town, and was established by the Jesuit missionaries in 1676 as a colony for the Indians who were converted to Christianity. The converts were Iroquois, mostly Mohawks, and remained loyal to the French during their quarrels with other Indians and the English. In the Canadian insurrection of 1838 Caughnawaga was the first place to be attacked by the rebels, who were repulsed by the Indians and a number of them taken prisoners. Pop. 2,000.

Caul, a membrane enclosing the viscera, such as the peritoneum or part of it, or the pericardium; also the amniotic membrane that surrounds all foetal structures and sometimes becomes caught by the head of a child at birth. Many superstitions have been connected in the past with cauls. The child that happened to be born with one was esteemed particularly fortunate; and the possession of it afterward, however obtained, was highly prized, as of a charm of great virtue. The superstition is thought to have come from the East. With the French, *être né coiffé* was an ancient proverb, indicative of the good fortune of the individual. The alchemists ascribed magical virtues to it; and, according to Grose, the health of the person born with it could, in after life, be judged of by its condition, whether dry and crisp, or relaxed and flaccid. Medicinal virtues were imputed to it by the ignorant, as well as the property of preserving the owner of it from drowning. It has been bought and sold occasionally at a high price, sailors having been known to give as much as \$150 for a single caul.

Caulaincourt, kô-län-koor, **Armand** (ärmän) **Augustin Louis de**, DUKE OF VICENZA, French statesman: b. Caulaincourt (Aisne), 9 Dec. 1772; d. Paris 19 Feb. 1827. He early distinguished himself as an officer, was made a general of division in 1805, and shortly after created Duke of Vicenza. Faithful to the last to Napoleon, he was made Minister for Foreign Affairs in 1813, and during the Hundred Days resumed the office, receiving

a peerage of France, of which he was deprived after the Restoration.

Cauliflower, a member (*Brassica oleracea*, var. *botrytus*) of the cabbage tribe, derived from the same original species as cabbage (q.v.), from which it differs in having a more or less compact head of metamorphosed flowers and adjacent parts instead of a bud-like head of densely packed leaves. Broccoli is a late hardy form of cauliflower not widely grown in America. Cauliflower is more delicately flavored than cabbage, like which it may be cultivated and prepared for the table. In its cultivation, however, it seems to be more difficult to bring to perfection unless conditions, especially moisture and temperature, are just right. The essentials of its cultivation are highly fertile soil well drained, but well supplied with moisture, a moist climate or season, and shelter from the direct rays of the sun, as on a northern slope, or reduction of the intensity of the sun's heat by planting either very early so as to mature in spring, or late so as to mature after mid-autumn. The heads produced in midsummer are generally inferior in both size and quality. When the heads begin to develop, the leaves are tied above them so as to keep out foreign materials, but mainly to make the heads whiter and more attractive to the purchaser. In preparing for the table the finer heads are usually served with a cream sauce; the poorer ones being pickled. In comparison with cabbage seed, the seed of cauliflower is very expensive because of the difficulty of maintaining its high quality. Formerly the seed was imported from Denmark and Germany, but Washington and British Columbia have been gaining in the market with their cauliflower, cabbage, and other related seeds.

Cauliflower suffers from the same enemies that attack cabbage. Consult: Bailey, 'Cyclopedia of American Horticulture'; Allen, 'Cabbages, Cauliflowers, etc.'

Caulking, **Calking**, or **Cauking**, the act of rendering the seams of a ship water-tight by driving oakum, cotton, or the like, between the planks in the ship's decks or sides, in order to prevent the entrance of water. After the oakum is driven hard into the seams it is covered with hot melted pitch, to keep the water from rotting it.

Caulop'teris, a genus of fossil tree-ferns found in the coal-measures.

Caura, kow'ra, a river of Venezuela, rises among the sierras of the frontier, and flows north-northwest to the Orinoco. On both sides stretches the territory of Caura (22,485 square miles), with immense forests of valuable woods.

Caus, or **Caulx**, **Salomon de**, French engineer: b. Dieppe 1576; d. Paris 6 June 1626. He was in the service of the Prince of Wales in 1612, and of the Elector Palatine, at Heidelberg, 1614-20, but by 1623 returned to France, and became engineer and architect to the king. At Frankfort, in 1615, appeared his 'Causes of Kinetic Energy,' a work in which is described an apparatus for forcing up water by a steam fountain, differing only in one detail from that of Della Porta. There is no reason to suppose that the apparatus ever was constructed, but on the strength of the description, Arago has claimed for De Caus the invention of the steam-engine.

Cause, that which brings about any change in the state, condition, circumstances, etc., of things; that which produces an effect.

In philosophy, that by which something known as the effect is produced, and without which it could not have existed. To give a satisfactory notion of all the senses in which this word has been used it would be necessary to review all the teachings of metaphysics from the time of Aristotle downward. The various positions of the conflicting philosophers can here be only very briefly indicated. Aristotle states causes to be of four kinds: efficient, formal, material, and final. The efficient is the force or agency by which a result or effect is produced; the formal the means or instrument by which it is produced; the material, the substance from which it is produced; the final, the purpose or end for which it is produced. A scientific cause demands the recognition of all the essential conditions, any one of which being absent the effect could not take place. Locke finds the origin of the notion of cause in sensation. Assuming that bodies have the property of modifying each other, it is only necessary to observe them to perceive and be driven to admit the principle of causality. Hume declares the power which we attribute to one object over another to be a chimera; such a power does not exist, or if it does we can have no idea of it. What we call cause and effect is merely two phenomena always following in the same order, and which we have fallen into the habit of associating in our minds in such a way that on perceiving the first we inevitably expect the second. According to Leibnitz there is no existence, however humble, but is a force, that is, a real cause. The notion of force is the base even of the notion of existence; all that which is has a certain virtuality, a certain causative power. The human soul, like all the other limited forces in this world, is but a monad isolated in itself, but yet in whose inner being the whole creation is reflected, and whose movements have been from the beginning co-ordinated by Divine Wisdom with the harmonious movement of the universe. Kant's doctrine is that the notion of cause and the principle of causality certainly exist in our minds; but they are only simple forms of our understanding, or the entirely subjective conditions of thought. We are compelled by a law or a form pre-existing in our intellect to dispose all the objects our imagination represents, or all the phenomena our experience can discover, according to the relation of cause and effect; but we do not know if anything really exists, independent from our intellect, which resembles a cause, a force, or effective power. Against the doctrines of the intuitionists it has been urged that the mere statement that the mind possesses a belief in causation proves nothing: some men believe in it, others do not, and unanimity is necessary to the establishment of a universal belief. Nay, more, the mere universality of a belief is no conclusive proof of its correctness, as put in the words of the late John Stuart Mill—"A mere disposition to believe, even if supposed instinctive, is no guarantee for the truth of the thing believed. If, indeed, the belief amounted to an irresistible necessity, there would be no use in appealing from it, because there would be no possibility of altering it. But even then the truth of the belief would not follow: it would only follow

that mankind were under a permanent necessity of believing what might possibly not be true; just as they were under a temporary necessity, — quite as irresistible while it lasted — of believing that the heavens moved and the earth stood still. The things which it has been supposed that nobody could help believing are innumerable, but no two generations would give the same catalogue of them." The theological question of a First Cause is debated on the ground that matter of itself is inert, that spirit is active, that in order of existence one spirit or active force must be the first and uncaused cause.

In law, a cause is a right of suit or action; it is something for which suit may be brought by someone against another; it includes the right of action. In practice, a cause of action comes into existence when there is such a state of facts or circumstances as will enable a person or party having certain relations with particular persons or property to commence a suit. Cause includes the right, but right may not include a cause; as a person may have a right of action which is barred by lapse of time, and as soon as the time expires the cause ceases.

Causeries du Lundi, *kōz-rē dū lēn-dē*, a famous series of literary criticisms by Sainte-Beuve. Every prominent name in French literature, from Villehardouin and Joinville to Baudelaire and Halévy, is here exhaustively discussed. Sainte-Beuve widened the scope of criticism by inventing what has been called "biographical criticism." He endeavors to explain the work by the character of the author, his early training, his health, his idiosyncrasies, and above all, by his environment. The 'Causeries' were first published as feuilletons in the papers. They may be divided into two distinct classes: those written before, and those written after, the Restoration. In the former there is more fondness for polemics than pure literary purpose; but they represent the most brilliant period in Sainte-Beuve's literary career. After the Restoration, his method changes; there are no polemics; however little sympathy the critic may have with the works of such writers as De Maistre, Lamartine, or Béranger, he analyzes their lives solely for the purpose of finding the source of their ideas.

Caustic, in medicine, any agent that causes a destruction of the parts. Caustics act by withdrawing water from the skin, by coagulation of the albumen or by other chemical change. Thus caustic soda and caustic potash act by the abstraction of water. They further act on fats, saponifying them, and are particularly serviceable as caustics if penetration is desirable. Sulphuric acid acts in much the same way, but it is very difficult to control its caustic action. Others of the acids are used as caustics, nitric, glacial acetic, tri-chlor-acetic, etc. Many mineral salts, silver nitrate, zinc sulphate, zinc chloride, copper sulphate, arsenic, etc., are valuable caustics. The most reliable caustic is the actual cautery, using a dull red flame. Caustics are used to stimulate the growth of granulating wounds, to remove warts, condylomata, etc., to cleanse ulcers, remove cancerous growths, to prevent poisoning by dog-bites, etc. See **ESCHAROTICS**.

In mathematics, the curve to which rays of light are tangent after reflection from a surface or refraction by a lens. Opticians endeavor so to shape their mirrors and lenses as to make the

CAUTERETS — CAVAGNAC

caustic two intersecting straight lines. When this is achieved, the "spherical aberration" disappears. Caustic curves may often be seen on the bottom of a cup, produced by reflection from the curved wall of the cup. See also **LIGHT**.

Cauterets, kō-tē-rā, a watering-place in the department of Hautes-Pyrénées, France, 3,250 feet above sea-level, in the valley of the Lavedan, 42 miles south-southeast of Pau. The stationary population of the place is only about 1,300, but it is annually swelled in summer by some 20,000 visitors, for whose accommodation numerous sumptuous hotels and bathing-establishments have been built. It is a good centre and guide-station for ascents among the Pyrenees. The sulphurous springs, 25 in number, and varying in temperature from 60° to 131° F., are the most abundant in the Pyrenees (330,000 gallons per day), and have been known from Roman times; though their modern reputation dates from the 16th century, when Margaret, sister of Francis I., held her literary court and wrote much of her 'Heptameron' at Cauterets.

Cautery. See **CAUSTIC**; **ESCHAROTICS**.

Cautin, kow'tēn, Chile, a province divided into the departments of Temuco and Imperial. It has an area of 3,127 square miles, and a population of 100,000. The city of Temuco (pop. 9,000) is the capital. Principal towns are: Nueva Imperial (3,000), Lautaro (3,500), and the port of Carahue (2,000). There is a regular line of steamers between Carahue and Valparaíso. In the province are numerous lakes, one of which, Villarica, with a surface of 100 square miles, lies at the base of a volcano of the same name. The Central Railway connects the capital with other cities of the republic. The soil of the province is fertile. Wheat and lumber are produced. The urban property is valued at \$7,600,000, and the rural at \$16,000,000.

Cautin, kow'tēn, a river in Chile; flows west through a province named after it, and empties into the Pacific Ocean. Its length is about 200 miles.

Cautionary, a term used in Scotch law and signifying the "promise or contract of one, not for himself, but for another." A simple cautioner is one who binds himself conjointly with the debtor or principal for the greater security of the creditor. The creditor may proceed against the principal debtor and cautioner, or against either of them. The cautioner may, however, stipulate on the document constituting the cautionary obligation that the creditor shall take legal measures against the debtor or principal. Cautioners are frequently taken bound, conjunctly and severally, or as full debtors, with the principal, in which case both parties are liable for the whole debt. It follows, from the nature of the obligation, that a cautioner who has paid the debt has an action against the principal for relief. All cautionary obligations must be in writing, and have the signature of the cautioner attached; the conditions of contract must be clearly stated, which must be strictly observed, otherwise the cautioner is freed.

Cautionary Towns, four towns in Holland, Briel, Flushing, Rammekens, and Walcheren, so named because they were given to Queen Elizabeth in 1585 as security for their repaying her for assistance in their struggle

with Spain. They were restored to the Dutch Republic by James I. in 1616, although only a portion of the sum advanced was refunded.

Cauvery, kō'vēr ī, **Cavery**, or **Kāveri**, a river of Hindustan, to the waters of which Mysore and the Carnatic owe much of their agricultural wealth. It rises from several head streams in Coorg and Mysore, near the coast of Malabar, flows southeast through Mysore and the Madras Presidency, and after a winding course of about 470 miles falls into the Bay of Bengal by numerous mouths, the largest being the Coleroon. Where it separates Mysore from Coimbatore the Cavery forms an island called Sivasamudram, near which are two magnificent cataracts, each about 200 feet high, and more or less broken into cascades according to the volume of water. In connection with this river and its tributaries important canals and dams have been constructed for purposes of irrigation, with the effect of rendering the country on either side highly productive. The Cavery is filled by the monsoon rains in May and July, but is not navigable except by small boats.

Cava, kā'vā, Italy, a city in the southern province of Salerno, situated in the valley of Fenestra, three miles northwest of Salerno. It is the seat of a bishop, suffragan to the Pope, and contains a cathedral, three other churches, a convent, a house of refuge, a hospital, and a seminary. Silk, cotton, and linen are manufactured here, and in the numerous small villages that surround the town. The district is extremely unproductive, but the inhabitants have become wealthy by their industry and commerce. About one mile from Cava is the magnificent Benedictine convent of the Trinity, which formerly contained an excellent library, now transferred to Naples. This convent is now national property, and contains a lyceum and boarding-school. Pop. 10,000.

Cavaignac, Jacques Marie Eugène Godefroy, zhāk ma-rē e-zhān gō-dū-frwa ka-vān-yāk, French politician, son of Louis Eugène Cavaignac (q.v.): b. 22 May 1853. He studied at the Lycée Charlemagne, Lycée Louis le Grand, École Polytechnique, and École des Ponts et Chaussées, interrupting his studies long enough to serve in the Franco-Prussian war. In 1882 he was elected to the Chamber of Deputies, and in 1885 was appointed Under-Secretary of State. In the Panama revelations of 1892 he bore a conspicuous part. On the organization of the Bourgeois cabinet, 30 Oct. 1895, he was appointed Minister of War. In August 1898, he added to the excitement over the Dreyfus prosecution by forcing Lieut.-Col. Henry to confess to a forgery of certain letters bearing on the Dreyfus case, and the accused officer committed suicide within a few hours. In the following month Cavaignac resigned his office. He is author of 'The State and Tariffs of Railroads' (1883); and 'Formation of Contemporary Prussia' (1891).

Cavaignac, Jean Baptiste, zhōn bāp tēst, French revolutionist: b. Gourdon 1762; d. Brussels 24 March 1829. He became an advocate at the Parliament of Toulouse; and in the National Convention acted as deputy from the department of Haute-Garonne. He rose to be one of the leaders of the Mountain (Extreme Republicans), and, on his various dictatorial missions to

CAVAIGNAC — CAVALIER

the armies of the Republic, displayed the greatest energy, tact, and incorruptibility. He was a member of the Council of Five Hundred; and afterward became a Councillor of State in Murat's kingdom of Naples. During the Hundred Days he acted as prefect of the Somme. He was banished as a regicide, at the second restoration.

Cavaignac, Louis Eugène, loo-ē è-zhān, French general: b. Paris 15 Oct. 1802; d. 28 Oct. 1857. His father, Jean Baptiste Cavaignac (q.v.), was a furious revolutionist, and member of the Council of Five Hundred. Young Cavaignac entered the École Polytechnique in 1820, and afterward the military school at Metz, and in 1824 joined the 2d regiment of engineers. He served in the campaign in the Morea, and in 1829 was appointed captain. Being at Arras on the outbreak of the revolution of 1830 he was the first officer in his regiment to declare for the new order of things. In 1832 he was sent to Africa, where he remained for several years, and greatly distinguished himself in defending the French settlement against the Arabs and by his judicious organization of military hospitals, barracks, and works of defense. In 1844 he received the appointment of brigadier-general, with the government of the province of Oran in Algeria.

Cavaignac was in Africa when the revolution of February 1848 took place. In March of that year he was created by the provisional government general of division and governor of Algeria. Shortly afterward the office of minister of war was offered to him, but declined. On 23 April he was chosen representative of the department of Lot in the National Assembly, and proceeding to Paris to take his seat arrived there on 17 May. The capital was then in a state of great excitement from an attempt on the assembly by the Red Republicans two days before. Cavaignac was offered again the portfolio of the minister of war, and this time accepted it. The measures which he adopted to guard against the crisis which was evidently approaching were prompt and decisive. In a few days an army of nearly 30,000 men was assembled in and around Paris, and this precaution was speedily justified by the events which followed. On 23 June, at 11 o'clock A.M., the terrible Communist insurrection burst forth, and for three days Paris presented the most dreadful scene of tumult and bloodshed which had been witnessed there since the massacre of St. Bartholomew. About 15,000 persons perished, and property was destroyed to the value of upward of \$1,000,000. By the energy of General Cavaignac, aided by the loyalty of the army and the national guard, the insurrection was suppressed on 26 June. On that day the National Assembly delegated the entire executive power to Cavaignac as dictator, who resigned it again into its hands on the 20th, and received it anew on the same day, with an acknowledgment by the legislative body of the services rendered by him to his country. Notwithstanding these he was defeated in the elections for the presidency in the month of December following, and Louis Napoleon was preferred to the office. On 20 December he resigned his dictatorship. After the *coup d'état* of 2 Dec. 1851, he was arrested and conveyed to the fortress of Ham, but was liberated after about a month's detention. In 1852 and in

1857 he was elected member for Paris of the legislative body, but on both occasions was incapacitated from taking his seat by refusing to take the oath of allegiance to the emperor. The last years of his life were spent at his country-seat in the department of Sarthe. See Montfort, 'Biographie du Général Cavaignac' (1848); Deschamps, 'Life' (1870).

Cavaillé-Coll, Aristide, ä-ris-téd kă-vă-yā-köl, French organ builder: b. Montpellier 2 Feb. 1811; d. Paris 13 Oct. 1899. He built the organs in the Parisian churches of St. Sulpice, the Madeleine, etc., and invented the pressure method for sounding tones of different depths and heights.

Cavaillon, kă-vă-yōn (ancient CABELLIO), France, a town in the department of Vaucluse, 14 miles southeast of Avignon, on the right bank of the Durance. It is an ancient place, and has a cathedral built between the 10th and 12th centuries. The surrounding district is one vast garden, producing excellent fruit, especially melons and peaches. A considerable trade is carried on in silk, olive-oil, fruit, early vegetables, and wool. The industries comprise straw hats, edge-tools, tanning, currying, the preserving of fruits and vegetables, etc. The Romans had an important colony here, and erected many edifices, of which almost the only remains are some tombs and the fragment of a triumphal arch. It was an episcopal city as early as the 5th century. Pop. 6,000.

Cavalcanti, Guido, gwē dō kă-vāl-kān'tē, poet: b. probably in Florence about 1252; d. there 28 or 29 Aug. 1300. He was the friend of Dante, and like him a zealous Ghibelline. When the dissensions of the Guefs and Ghibellines disturbed the public peace of Florence the citizens banished the chiefs of both parties. The Ghibellines were exiled to Sarzana. On account of the unhealthy air of that place they were permitted to return; but Cavalcanti had contracted a disease of which he died at Florence. In his youth he made a pilgrimage to St. Jago de Compostella in Galicia. Returning home through France he fell in love at Toulouse with a young lady of the name of Mandetta. To her most of his verses which we possess are addressed. They are remarkable, considering the period at which they were written, for their beautiful style. His 'Canzone d'Amore' have gained him the most fame. The learned Cardinal Egidio Colonna and some others have made commentaries on it. His 'Rime,' published by Cicciporci, appeared at Florence in 1813. See Ercole, 'Guido Cavalcanti e le sue Rime' (1885).

Cavalcaselle, Giovanni Battista, jō vān nē bāt tēs'ta ka-vāl-kă-sē'l'la, Italian historian: b. Legnano 22 Jan. 1820; d. Rome November 1897. He became the literary associate of J. A. Crowe (q.v.), with whom he produced the epoch-making 'History of Painting in Italy' (1864-71), the most complete work on the subject; 'Early Flemish Painters' (1857-72); 'Life of Titian' (1877); 'Raphael' (1883).

Cavalier, Jean, zhōn kă-vāl-yā, French soldier, chief leader of the Camisards in the wars of the Cévennes: b. Ribaute, near Anduze, 1681; d. Chelsea, England, 17 May 1740. He was at Geneva when the severe measures of Louis XIV. against the fanatical Camisards induced him to return home. Several insurrec-

CAVALIER—CAVALRY

tions had already broken out, but he soon so distinguished himself by his courage and success, that, though only at the age of 24, he became the acknowledged head of the insurgents. Notwithstanding their gallantry they were obliged to carry on the war on such unequal terms that the impossibility of success became apparent, and Cavalier entered into a capitulation with Marshal Villars, by which he obtained a pension of 1,200 livres, a colonel's commission, and permission to raise a regiment of his own for the king's service. He was summoned, however, to Versailles, and, finding himself looked upon with suspicion, made his escape and soon after visited England. In the Spanish war, being supported by the English and Dutch, he commanded a regiment raised by himself and partly consisting of refugee Camisards, and distinguished himself greatly at the battle of Almanza in 1707, where he was severely wounded. He was afterward pensioned by the British government, appointed governor of Jersey, and made a major-general.

Cavalier, (1) a horse-soldier; an armed horseman; a knight; the name given to the supporters of King Charles I., during the Great Civil war in England, from their gay dress and demeanor, as contrasted with the austerity of the parliamentary party, who were styled Roundheads, from the mode in which the more puritanical of that body wore their hair closely cropped. (2) In fortifications, a kind of interior bastion, several feet more elevated than the principal bastion of the fortress in which it is formed. The use of the cavalier is two-fold: It serves either to defile the works from the fire of an enemy on an adjacent height, or to command the trenches of the besiegers. Cavaliers are sometimes constructed in the gorges, or on the middle of the curtain, and their form is the semicircular; but when they are within the bastion they are now built with straight faces and flanks parallel to those of the work in which they are placed. French cavaliers are works raised by besiegers on the glacis of a fortress, for the purpose of enabling them to direct a fire of musketry into the covered way.

Cavaliere Servente, kà-vä-lë-är'ë sër-vën'tà. See CICISBEÖ.

Cavalieri, Emilio del, ä-mël'ë-ö dël kã-väl-yä'rë, Italian musician: b. about 1550; d. Florence 1599. He was a Roman nobleman and a pioneer in musical composition, having probably written the first oratorio and the first work akin to the modern opera. His compositions were: 'Soul and Body'; 'Phileas's Despair'; etc.

Cavalieri, or Cavalleri, Francesco Bonaventura, frän-chës'kô bo'nä vãn too'rä, Italian mathematician: b. Milan 1598; d. Bologna 3 Dec. 1647. He studied mathematics at Pisa under B. Castelli, a disciple of Galileo, officiated as professor in Bologna, and was author of several mathematical works, the most prominent of which was entitled 'Geometria Indivisibilium continuorum nova quadam ratione promota.' Having expressed in this work some original ideas concerning the abstruse sciences, the Italians claim him to be the inventor of the infinitesimal calculus.

Caval'la. See KINGFISH.

Cavalli, Pietro Francesco, pë-ä'trô frän-chës'kô kã-väl'lë, Italian composer: b. Crema

about 1600; d. Venice 14 Jan. 1676. He began to write operas in 1637, and continued to produce them for 32 years. Among his works are: 'Xerxes'; 'Jason'; and 'Hercules in Love.' He is now believed to be the inventor of the 'Da Capo,' which was generally attributed to Scarlatti.

Cavallini, Pietro, pë ä'trô kã-väl-lë'në, Roman painter: fl. in the latter part of the 13th and in the early part of the 14th century. He was the disciple of Giotto, and the first painter of the Roman school who was worthy of competing with the great Florentine masters. His most celebrated work, a picture of the 'Crucifixion,' is at Assisi. Most of his other works are now destroyed.

Cavallo, kã val'lô, Tiberius, Italian physicist and inventor: b. Naples March 1749; d. London December 1809. He early removed to England, where he published, in 1775, a notice of 'Extraordinary Electricity Observed at Islington.' He invented several ingenious instruments for electrical and chemical experiments. His apparatus for measuring the force and quantity of electricity is remarkably delicate and accurate. In 1779 he was admitted to the Royal Society. His study of the influence of air and light on plant-development was brilliantly original, and paved the way for valuable discoveries in organic life. He wrote: 'Medical Electricity' (1780); 'A Treatise on the Nature and Properties of Air, etc.' (1781); 'Complete Treatise on Electricity' (1786); 'Treatise on Magnetism in Theory and Practice' (1787); 'Elements of Natural and Experimental Philosophy' (1803); and other scientific works.

Caval'y, one of the popular names of *Caranx hippos*, called also horse-crevallé and jack. It is a large and well-known food fish, which occurs abundantly on both coasts of North America, as far south as Cape Cod and the Gulf of California, and also in the East Indies. It belongs to the family *Carangida* (q.v.), and is distinguished by having an enlarged tooth on each side of the tip of the lower jaw, and by having the breast naked.

Cavalotti, Felice, fã-lë'chã kã-väl-öt'të, Italian statesman and poet: b. Milan 6 Nov. 1842; d. Rome 6 March 1898. He fought under Garibaldi and gained celebrity; was a political journalist. Elected to the Italian parliament (1868), he opposed Crispi and became an extreme Republican. He fought 32 duels, in the last of which he was killed. The most noted of his tragedies are: 'Agnes de Gonzaga'; and 'Alcibiades' (1874). He also published volumes of lyric verse, his best work being 'The Canticle of Canticles.'

Cavalry. Ancient history records many marvelous statements concerning the operations of cavalry. The numbers attributed to the columns of Ghengis Khan and other celebrated raiders seem quite incredible to the modern military student whose ideas are naturally directed to the serious questions of transport and supply. Subsisting mainly upon a species of flour prepared from goat's milk, dried, the idea of a modern commissariat train was not within the range of the wildest dreams of the Tartar hordes, which for centuries roamed over an immense area of Asia and even Europe. Cavalry was used for many centuries before the

UNITED STATES CAVALRY EXERCISES.

CAVALRY

Christian era and proved its value in many historic campaigns. Alexander the Great developed his cavalry to a considerable degree of excellence and used it in large bodies with marked success. The Romans made effective use of cavalry, but depended almost entirely upon auxiliaries for recruiting that important branch of their armies. Saddles had not come into use during all this early period of military history and all cavalry then existing must of necessity be classed as light or irregular.

During the Middle Ages, military power was quite generally dependent upon the good will of and exercised through the nobility or chiefs of clans. The use of heavy armor, battle axes, and powerful two-handed swords, demanded strong saddles and large horses. The feudal system was gradually developed and spread over Europe and the British Isles. The fighting was done by the knights and esquires, mounted, while the peasant retainers armed with pikes and crossbows, constituted groups of footmen, who frequently operated in campaigns of considerable duration, but were not armies in the modern sense of the term.

The invention of gunpowder was responsible for a revolution in military methods, and the changes were particularly noticeable in the mounted contingents. The long-continued efforts to make mounted infantry and dragoons efficient while the state of firearms was yet quite primitive, resulted only in discrediting the horsemen. The value of armor was much decreased through the introduction of gunpowder, but its use in some forms continues even in this utilitarian age and generation. The lance has been periodically lauded and discredited. At various times in the world's history it has won high praise through great performance on the field of battle. It has been restored, recently, to full favor in some of the most highly trained and effective armies of modern times, yet no serious test by armies has been made of it since the days of Napoleon. A few charges here and there during a century do not constitute a service test of any weapon. The influence of improvements in weapons is generally seen in modifications of tactics and drill regulations. From this cause may be traced the modification in the orders of battle, which, in various periods of history have required that cavalry should engage in formations ranging from one to six or more ranks in depth. The Americans abandoned the double-rank formation for cavalry as a result of the experience of the Civil War, when nearly 300,000 mounted men, exclusive of mounted infantry, were in the opposing armies. The history of cavalry and its gradual evolution from the hordes of barbarian horsemen of ancient times, down to the modern regiments of lancers or dragoons, covers a vast field which cannot be sketched in a brief essay. The development of the American type of cavalry during the past half century is an interesting and profitable study because of the position now occupied by the United States in the world's affairs.

Until the reorganization of the United States Army in 1901 the proportion of the various arms was always determined through the expediency of the moment rather than upon any well-considered general plan. During the Revolutionary struggle, the early Indian wars, the War of 1812, and, in fact, until the discouragement of con-

stant failure in 1833 to 1836 demanded a change of policy, the mounted service of the army was almost wholly performed by militia or volunteers. The absence of a properly organized contingent of cavalry during the Revolution enabled the young and energetic Tarleton to ride with his small force of dragoons almost at will through the southern Colonies. All the early Indian wars were treated as spasmodic outbreaks demanding temporary application of force, but requiring no provision for the future. The War of 1812 contained much discouragement, but its history records several marked incidents to prove the value of trained troops and the urgent need in a Republic of an organized body to keep alive a knowledge of military art and improvements applicable to warfare. The experience was ignored, however, and it was not until 1821 that a reorganization of the army was undertaken and then the cavalry was left out entirely. During the Black Hawk war a battalion of mounted rangers was called into service and was merged the following year (1833) into the new regiment of mounted troops, the First Dragoons, which constituted the first permanent cavalry regiment of the United States Army. The Second Dragoons was organized in 1836 especially for service in the Seminole war and the valuable services rendered, together with the increasing needs of protection for the Southwestern frontier prevented the disbandment of this fine regiment. These two regiments of dragoons constituted the entire mounted force of a permanent character in service prior to the Mexican war. During this war the regiment of Mounted Rifles was organized and, although it fought as infantry for a time, it was reorganized as a mounted regiment at the close of the war and has continued in service since that time. The acquisition of California and other territory, the discovery of gold, followed by unprecedented immigration through and across the Indian country, demanded a further increase of the army, and in 1855 Congress authorized two regiments, the First and Second Cavalry, which were organized and sent at once to duty upon the Western frontier. Encroachments upon Indian lands and the ever-increasing tide of emigration flowing constantly beyond the border settlements caused incessant conflict with Indian tribes scattered from British Columbia to the Mexican boundary, and from the Missouri River to the Pacific Ocean. With scant necessities and no luxuries in post or field these fine regiments so impressed themselves upon the Indian tribes with whom they came in conflict that the punitive lessons were of untold value when the Civil War caused a general withdrawal of the regular troops from the frontiers. During all the period from their organization until 1861 the regiments had retained their designations of Dragoons, Mounted Rifles, and Cavalry. The drill regulations in vogue during this period were adapted from those in use by the French army and while they now appear somewhat cumbersome, they served well their purpose. These regiments were very efficient mounted organizations and were the schools wherein were trained many of the most successful generals of the Civil War. Their gallantry was attested on many fields in the Florida war, the Mexican war, and upon the great plains of the West. They uncomplainingly endured untold hardships

CAVALRY

by flood and field, especially in the Utah campaign, and fixed a composite type of cavalry upon which all were reorganized in 1861, and which served as a model for the organization of the 272 regiments of cavalry mustered into service during the Civil War.

In 1861 Congress authorized the organization of the Third regiment of cavalry, but immediately after abolished the terms dragoons and mounted rifles, and designated all the regiments as cavalry, giving them numerical designations in the order of their original organization. It was not, however, until 1862 that the old regiments were given the same organization as the new regiment. Prior to this time the regiments were organized on the European model of five squadrons of two troops each. Both the regular and volunteer regiments were organized with 12 troops each and the tactical organization of squadrons of two troops each was continued. The dragoons had secured a high place upon the roll of honor through their gallantry and dash in the Mexican war, and all the regiments had emerged from the period of Indian conflicts with justifiable pride. All experience previous to the Civil War had been limited to meeting emergencies arising in dealing with cunning and relentless savages. A new field of action was now presented when the necessity arose for the organization of larger tactical bodies of cavalry than had ever before been required in this country. Millions were expended in putting into service volunteer cavalry regiments under the prevailing idea that patriotism made invincible soldiers. Much discouragement and an enormous waste of public funds resulted. It was only after a year or two of experience and a thorough weeding out that the Union cavalry became worthy of the reputation which quickly came in the wake of its great successes. The Confederate cavalry was composed entirely of those who could supply their own mounts. This drew to that arm a class of young men accustomed to horseback riding from infancy and usually possessed of a knowledge of firearms. This gave them a great advantage over their opponents, which they maintained during all the early period of the Civil War. Inability to supply themselves with remounts, together with the gradual improvement of the Union cavalry brought about a change, and during the last two years of the War the services of the cavalry under Sheridan, Wilson, and other gallant leaders, placed upon the pages of history a continuous record of victories. Operations which became known by the generally accepted title of raids, were conducted by both armies. Legitimate raids, carefully planned and executed with celerity and decision have become recognized as valuable adjuncts of the operations of armies. A large number of so-called raids during the Civil War, on both sides, were demanded by no military necessity, and resulted in excessive losses of horses without corresponding benefits to the general plan of operations.

Throughout the Civil War the question of supplying the cavalry with horses was a very serious one. The waste of animals due to ignorance was great, but the widely extended field of operations, the difficulty of supplying forage, the improper use of cavalry, and the continuous fatigue incident to raids placed strains upon the powers of endurance of the horses which few could withstand.

Deaths due to wounds received in battle constitute but an insignificant part of the losses of cavalry horses in war. It was with a view to both increased economy and efficiency that after a war experience of two years a cavalry bureau was established. An enormous number of horses broken down through excessive marching and fatigue were turned in at the several depots and recuperated sufficiently to be again issued. This was but a fraction of the whole number supplied, owing to the difficulty of returning worn-out horses from distant and isolated points. Some idea of war losses may be had from the statement that there were purchased during the fiscal year ending 30 June 1864, 188,718 horses. During the first eight months the cavalry of the Army of the Potomac was supplied with two complete remounts which required 40,000 horses. The total number of horses and mules required to keep up the supply was 500 a day, and the data collected showed that for every two men of the whole army one animal was required in the ranks or trains. The recent experience of the British army in South Africa indicates that the loss of animals in the Civil War was not exceptional and that whenever campaigns are undertaken in a sparsely settled country history will repeat itself.

The organization, equipment, and methods of employment of cavalry in the Civil War gradually became quite uniform and have since been clearly recognized as the American system. The cavalry was armed with breech-loading magazine carbines, while the infantry continued to the end of the war to use the muzzle-loading rifle. This accounted for the superiority of fire action whenever the cavalry fought dismounted. There was no inclination to avoid mounted fighting with sabre or pistol whenever cavalry was opposed by cavalry on suitable ground, but the most efficient fighting, and that which gave the best results was accomplished by dismounted fire action. The regiments were uniformly armed with breech-loading carbine, pistol, and sabre. The horse equipment consisted of a McClellan saddle-tree covered with rawhide, a saddle blanket, a pair of small saddle-bags, halter and bridle with single rein and curb bit. The arms and equipment have continued to find favor and remain the same in name, but modernized and improved to the highest known standard. There is no stagnation in such matters and experimentation is continually going on with a view to improvement. At the present time (1903) the improved saddle-tree is covered with stuffed russet leather and the saddle-bags are much larger than those formerly used, a change brought about by the necessities of frontier service subsequent to the Civil War. The new carbine will be second to none in the world in the essentials of penetration and trajectory.

The present organization of the cavalry regiments is the same as that adopted in 1862 except that a squadron now comprises four troops instead of two. This makes the number of squadrons in each regiment three, which corresponds with the number of majors and admits of treating the squadron both as an administrative and tactical unit. The number of regular regiments continued at six throughout the Civil War, but was increased to 10 in 1866, because of the requirements of protection for the frontier. As the Indian lands became circumscribed by the settlements, some of the regiments were with-

UNITED STATES CAVALRY EXERCISES.

drawn from the frontiers and larger garrisons were established with a view to better instruction. The school of practice which existed during the continuance of Indian hostilities could not well be improved upon as a means of development of self-reliance, woodcraft, and the ability to care for one's self generally in the field. The cessation of savage warfare made it necessary to devise schemes of instruction, having for their object the training of the younger generation of soldiers in campaign duties. Although the American cavalry has not been tested in mounted combat with the cavalry of any of the great military powers of modern Europe, it has proved its efficiency and worth upon many fields. During the Santiago campaign of 1898, in the island of Cuba, owing to insufficient transports, the regular cavalry division participated dismounted. The regiments performed every duty required of the infantry and sustained the reputation for gallantry and efficiency won upon many previous fields of the Civil and Indian wars. The same degree of success has followed the cavalry operations in China and the Philippines. Complete success was lacking in the operations against the Philippine insurgents until a cavalry brigade, provided with pack mules for transportation of rations, was put in the field. It then became possible to follow up the insurgent army, which rapidly fell to pieces and began the guerrilla warfare, which characterized the later days of the insurrection. The continuance of the insurgent warfare, together with the conditions existing in China, made it necessary to reorganize the United States army and by an increase of its personnel to make practicable the release from active service of about 35,000 volunteers who had been enlisted and sent across the seas at great expense.

In undertaking this reorganization, the experience of the past 50 years was carefully studied and many changes introduced, although as a matter both of expediency and compromise many desirable reforms were omitted. Notwithstanding the prevailing political prejudices against modification of the military system, there is no more conservative institution in all America than the regular army of the United States. In determining upon the organization of the cavalry, and of the field artillery also, it was recognized that the organized national guard of the country is composed almost wholly of infantry. The expense of mounted troops is very great and it is quite certain that at the outbreak of war of any magnitude, no reliance could be placed upon volunteer cavalry for mounted action within a less period than one year. Under the last reorganization of the army, a cavalry force of 15 regiments was provided. The American regiment is composed of three squadrons of four troops each, with a minimum number of 65 and a war strength of 100 men to each troop. The European and British cavalry still retain the small squadron of two troops and with four or five squadrons to each regiment. The American cavalry squadron with ranks completely filled to war strength, would be somewhat unwieldy, but the numbers have been fixed as the result of much experience, all of which tends to prove that troops in barracks never march to the field with full ranks, and that after a brief campaign the numbers become still further reduced through weeding out of

unfit men and horses. Every effort is made to perfect the organization and equipment, but some of the most pronounced lessons of the Civil War are still neglected. The recently authorized general staff corps is regarded as the means through which our past and future military experiences will be profitably studied and the results made available for practical application in the regular and volunteer armies, which, under the laws of the country, constitute, in time of war, the "Army of the United States."

GEN. W. H. CARTER,
Army War College, Washington, D. C.

Cav'an, Ireland, a county in the province of Ulster, having Fermanagh on the north, Leitrim on the west, and Longford and Westmeath on the south; area, 746 square miles. In the northwestern part is a range of hills called the Ballymageragh Mountains, but the remaining surface, which is undulating and irregular, is pervaded by bog and interspersed with many fine lakes. The chief rivers are the Erne, the Woodford, the Blackwater, and the Annalee, and the chief lakes Lough Ramor, Lough Sheelin, Lough Gowna, Lough Oughter, and Upper Lough Erne. Much of the soil of this county is cold, spongy, and inclined to be rushy. The chief cereal crop is oats, the chief green crop potatoes. Wheat is little cultivated; flax is raised to some extent, and the high lands are good for grazing. Linen-bleaching and the distilling of whiskey are the chief industries. The principal towns are Caven, Cootehill, and Belturbet. Pop. (1901) 97,368.

Cavan, Ireland, a town, capital and chief business centre of the above county, 57 miles northwest of Dublin. There are churches for the Episcopalians, Roman Catholics, Methodists, and Presbyterians, an endowed school founded by Charles I., municipal and county offices, jail, union workhouse, a court-house, an infirmary, a fever hospital, and a Roman Catholic college. Pop. 3,000.

Cavanilles, Antonio José, ăn-tō-ně'ō hō sǎ' kǎ-vā-ně'l'yēs, Spanish clergyman and botanist: b. Valencia 1745; d. Madrid 1804. In 1777 he went to Paris and remained there 12 years, occupied with the study of several sciences, but chiefly with botany. He published there, in 1784, 'Observations on the Article Spain in the New Encyclopedia,' written with as much patriotism as profound reasoning. In the following year he commenced his great botanical work, 'Monadelphix Classis Dissertationes decem' (Paris 1785-9; Madrid 1790, 4to, with engravings). After his return to Spain he wrote 'Icones et Descriptiones Plantarum, quæ aut sponte in Hispania crescunt aut in Hortis hospitantur' (1791-9, 6 vols. folio, with 601 engravings). It contains a number of new genera and species, natives of Spain, America, India, and New Holland. In pursuance of a commission from the king, Cavanilles traveled in Valencia, and collected the materials for his 'Observaciones sobre la Historia Natural, Geografía, Agricultura, Poblacion, etc., del Reyno de Valencia' (1795-7, 2 vols. folio, with copperplates from the drawings of the author). The work was published at the expense of the king, and intended as the first part of a similar work to embrace the whole of Spain. Thunberg has named a family of plants Cavanilla.

CAVATINA—CAVE ANIMALS

Cavatina, kāv-a-tē'na, in music, a short operatic air without a return or second part, sometimes relieved with recitative, but now extended to the aria generally, especially if the character of expression is tender, hopeful, or joyous. In this elegant and gracefully melodic class of composition the Italians naturally eclipse all other musicians; yet the *Il mio Tesoro* of Mozart will bear comparison with the finest cavatinas ever written.

Cave, Edward, English printer, founder of the 'Gentleman's Magazine': b. Newton, Warwickshire, 27 Feb. 1691; d. London 10 Jan. 1754. His first occupation was that of clerk to a collector of the excise in the country. He then went to London, and put himself apprentice to a printer. When his indentures expired he obtained a place in the post-office, and employed his leisure in writing for the newspapers. He published in January 1731 the first number of the 'Gentleman's Magazine,' which, under a considerably modified form, has continued till this day. Cave was deprived of his place in the post-office on account of his having resisted some abuses relative to the privilege of franking letters. During his last illness Dr. Johnson (who subsequently wrote his life) was often an attendant by his bedside.

Cave, Henry William, English artist and traveler: b. Brackley, Northamptonshire, 1854. He was educated at Queen's College, Oxford, and in 1877 founded the commercial establishment of Cave & Company at Colombo, retiring in 1887. He has published 'Colombo and the Kelani Valley' (1893); 'Kandy and Peradeniya' (1894); 'Nuwara Eliya and Adam's Peak' (1895); 'The Ruined Cities of Ceylon' (1897); 'Golden Tips,' a description of Ceylon' (1900).

Cave, or **Cavern**, an opening produced by nature in the solid crust of the earth. Caves are principally met with in limestone rocks, in gypsum, sometimes in sandstone, and in volcanic rocks (basalt, lava, tufa, etc.). The form of the caves depends partly upon the nature of the substance in which they exist; but it is frequently altered by external causes. Out of some caverns rivers take their course; others again admit rivers, or may be said to swallow them for a space. There are many and various causes for the formation of caves. Those in limestone and gypsum are unquestionably the results of the dissolving power of water; in fact the almost perfectly uniform direction, the gentle and equable declivity of most caves, appear to be the effect of the long continuance of water in them, the action of which has widened the existing crevices. In trachyte and lava, caves appear to have been produced by the effects of gas. The caves of gypsum often contain foul air; the caves of limestone, various figures of stalactites, produced by the deposit of the lime dissolved in the water. Many of these lime caves contain remnants of bones of animals, such as hyænas, elephants, and bears. See CAVE-DWELLERS.

Many caves are remarkable only on account of their great size, or sublime from the awful gloom which pervades them, and the echoes which roll like thunder through their vaulted passages. Some are of great depth, as that of Frederikshall, Norway, which is calculated to be 11,000 feet in depth. One of the grandest

natural caverns known is Fingal's Cave (q.v.) in Staffa, one of the Western Islands of Scotland. Its sides are formed of ranges of basaltic columns, which are almost as regular as hewn stone. The grotto of Antiparos, on the island of the same name, in the Grecian Archipelago, is celebrated for its magnificence. The roof is adorned with stalactites, many of them 20 feet long, and hung with festoons of various forms and brilliant appearance. In some parts immense columns descend to the floor; others present the appearance of trees and brooks turned to marble. The Peak Cavern in Derbyshire, England, is a celebrated curiosity of this kind. It is nearly half a mile in length; and, at its lowest part, 600 feet below the surface. Other famous stalactitic caves are the Luray Cavern (q.v.), Page County, Va.; one near Matanzas, Cuba; one near Adelsberg, Carniola; the Wyandotte Cave (q.v.), Crawford County, Ind.; and Madison's Cave, in Rockingham County, Va. The caves of Kirkdale, in England, and Gailenreuth, in Germany, are remarkable for the quantities of bones of the elephant, rhinoceros, and hyæna found in them. In the rock of Gibraltar there are a number of stalactitic caverns, of which the principal is St. Michael's Cave, 1,000 feet above the sea. Other celebrated caves in America are Weyer's Cave, in Augusta County, Va., extending 800 yards, but extremely irregular; the Colossal Cavern, Ky. (q.v.), discovered in 1895, and the Mammoth Cave (q.v.) in Edmondson County, Ky., which encloses an extent of about 150 miles of subterranean windings. One of its chambers, called the Temple, covers a space of nearly five acres, and is surmounted by a dome of solid rock 120 feet in height. The Cumberland Mountains, in Tennessee, contain some curious caverns, in one of which, at a depth of 400 feet, a stream was found with a current sufficiently powerful to turn a mill. Another cave in the same State is named Big Bone Cave, from the bones of the mastodon which have there been discovered. In the Raccoon Mountains, near the northwestern extremity of Georgia, is Nicko-jack Cave, 50 feet high and 100 feet wide, which has been explored to the distance of three miles. A stream of considerable size, which is interrupted by a fall, runs through it. Caves are sometimes found which exhale poisonous vapors. The most remarkable known is the Grotto del Cane, a small cave near Naples. In Iceland and Hawaii there are many caves formed by the lava from volcanoes. In the volcanic country near Rome there are many natural cavities of great extent and coolness, which are sometimes resorted to as a refuge from the heat. In South America is the cavern of Guacharo, which is said to extend for leagues. For information concerning human and animal remains in caves, see CAVE-DWELLERS.

Cave Animals, or **Cave Fauna**, an assemblage of animals of different classes which are blind and either totally or partially eyeless.

Distribution of Cave-Regions.—In the United States the caves containing permanent inhabitants are situated south of the former region of glaciers, that is, in Mammoth and adjoining caves in Kentucky; Wyandotte and smaller caves in Indiana; caves in Carter County, Ky., and Weyer's and the Luray caverns in Virginia. These regions have been honey-

CAVE ANIMALS

combed by the action of subterranean streams now dried up. With these systems of subterranean drainage are associated sink-holes, and deep, dark wells inhabited by blind fish, crayfish, and other crustaceans of the same species as those inhabiting the caves. Other caves more or less tenanted by blind forms are situated in Mexico, in open sink-holes in Cuba, as well as in caves and wells in New Zealand. Rich cave faunæ are found in southern France, and in limestone deposits near or at the base of the Pyrennes, though the great grotto of Adelsberg, near Trieste, is the classic abode of cavernicolous forms, including the blind triton, eyeless beetles, etc.

Mammoth Cave (q.v.) is the type of a great system of underground passages and chambers where these blind animals live. The total length of its avenues is about 150 miles. In the older and dry passages and chambers there is little life; the animals are mostly found in the newer and damp places, the aquatic forms living in the streams and pools. There is no vegetation except a few scattered molds and fungi. The food is scanty, and the animals are carnivorous, preying on one another. The temperature is very equable, the mean for the winter months being 53° F., and for the summer 54° F. The number of species thus far detected in Mammoth Cave is about 75, and in other American caves about 40 or 50 more, while several hundred kinds exist in European caverns.

Blind Fishes.—The most striking and interesting form in Mammoth Cave is the blind-fish (*Amblyopsis spelæus*). It is about four inches long, colorless, and blind, the eyes being vestigial. This fish seeks the dark and shuns the light, being much disturbed by a lighted match or bright sunlight, or even by a ray of light. In well-fed adult specimens there is no external indication of an eye; but in young ones, before reaching a length of two inches, the eyes can be distinctly seen, owing to their pigment, which is lost in the adult. The optic nerve can be traced in examples under an inch in length, but in large specimens the nerve to the brain cannot be followed. The lens is much reduced, and, in fact, the vestiges of the eyes are exceedingly variable. This will apply to the eyes of other blind fishes and blind insects, crustacea, etc. While the sense of sight is lost, that of touch in the blind-fish, as in most other cave animals, is exalted. *Amblyopsis* is provided with tactile papillæ, arranged in ridges on the front and sides of the head. Though the ears of this blind-fish are said by some authorities to be largely developed, others state that they manifest total indifference to light and sound. They are said to show extreme timidity and caution in their movements.

Blind Salamanders.—A still higher type of vertebrate, two species of salamanders have become adapted to cave life, losing their eyesight by disuse. The species of the genus *Spelerpes* frequent damp, dark situations and the entrances to caves. An allied form (*Typhlotriton spelæus*) is distinctly a cavernicolous as distinguished from a twilight species, and has never been found outside of caves. Its eyes show early stages of degeneration. It inhabits caves in southwestern Missouri, and occurs under rocks in and out of water. Still another salamander, whose eyes are the most degenerate known among amphibians, is the *Typhlomolge*

rathbuni. It lives in subterranean streams, tapped by an artesian and also a surface well, near San Marcos, Texas, and likewise occurs in one of the caves near that town. Its remarkably long and slender legs are too weak to support its body when out of water. The eyes of this salamander are in many respects much more degenerate than those of the *Proteus* of Austrian caves.

The lower animals tell the same story of degeneration, blindness and total or partial atrophy of the eye, together with loss of color, and, in a more striking way, the compensation for the loss of vision by a great increase in length of the antennæ and other appendages, or the growth of long, slender tactile bristles.

Blind Crayfish and Other Crustacea.—The blind crayfish (*Orconectes pellucidus*) is a common cave form. It differs from its out-of-door allies in being blind, slender-bodied and colorless. The eyes are present, but they are much reduced in size, and destitute of a cornea and of black pigment, while the colorless body is slender. It is not only blind, but deaf, and exceedingly timid and cautious in its movements. Other blind or eyeless crustaceans are various kinds of amphipods and isopods, both aquatic and terrestrial, of which species of *Cacidotea*, allied to the *Asellus*, a common crustacean of fresh waters, are the most abundant, and form the food-supply of the blind crayfish.

Blind Insects.—The eyeless beetles of caves (*Anophthalmi*) have no vestige of eye or of optic nerves and ganglia, while their bodies and appendages are slender. They grope their way about by means of very long tactile bristles. Other beetles, such as *Adelops*, which have retained vestiges of the outer eye; some spiders comprising an eyeless species, and others with eyes varying in size, some much reduced, spin little webs on the walls of the chambers. Among the harvestmen some (*Phalangodes*) have extraordinarily long legs; while the *Camponotus* (q.v.), a wingless insect of the Mammoth and other caves of the United States and Europe, differs from the outdoor form in its antennæ and abdominal appendages, being greatly exaggerated in length. There are also mites, myriapods, primitive wingless insects (*Podurans*), a few flies, worms, and infusorians.

Origin and History.—The fauna of caves is evidently composed of the descendants of individuals which have been carried by various means into the subterranean passages, have become adapted to life in perpetual darkness, becoming isolated, and thus, as long as they are subjected to their peculiar environment, breed true to their species, and show no tendency to relapse to their originally eyed condition. The absence of the stimulus of light causes the eyes, through disuse, to undergo reduction and atrophy. With this goes, in certain forms, the loss of the optic ganglia and optic nerves. I have found and stated the following effects of disuse in the invertebrate animals of Mammoth and other caves, and from these statements it will be realized how profoundly the organisms have been modified:

1. Total atrophy of optic lobes and optic nerves, with or without the persistence in part of the pigment or retina and the crystalline lens (certain Crustacea, harvestmen, *Adelops*, beetle, and the myriapod *Pseudotremia*).

CAVE-BEAR — CAVE-DWELLERS

2. Persistence of the optic lobes and optic nerves, but total atrophy of the rods and cones, retina (pigment), and facets (blind crayfish).

3. Total atrophy of the optic lobes, optic nerves, and all the optic elements, including rods and cones, retina (pigment) and facets (*Anophthalmus* beetle, and the myriapod *Scoterpes*).

An interesting fact, confirmatory of the theory of occasional rapid evolution, as opposed to invariably slow action involved in pure Darwinism, is that we never find any vestiges of the optic lobes or optic nerves; if they are wanting at all, they are totally abolished.

Compensations for Loss of Eyesight.—On the other hand, certain other parts of the body, as the result of use, become extraordinarily developed; such are the tactile papillæ of the blind-fish, the greatly lengthened feelers and legs, the long, delicate tactile hairs of various *Crustacea* and insects. It is plainly the case that the enhanced development of these organs is the result of frequent use of exercise. There is no need of invoking natural selection, these parts developing as the direct result of the change of habits, of the new needs of the animals to feel their way about, forced to adopt such habits by the abnormal conditions of their existence. Although the animals are members of very different groups, inheriting very different structures and habits, yet all genuine cave animals resemble each other in being pale, and ghost-like, in the exaltation of the tactile sense, and the corresponding increase in length and delicacy of the extremities.

Theories of the Origin of Cave Forms.—Darwin attributed the loss of eyes to disuse, stating that natural selection was not operative. Packard stated the view that the loss of eyes was attributable to the Lamarckian facts of change of environment, and consequent disuse, isolation, and use-inheritance. The latest author, Eigenmann, concludes that the Lamarckian view—that through disuse the organ is diminished during the life of the individual, in part at least on account of the diminution of the amount of blood going to a resting organ, and that this effect is transmitted to succeeding generations—not only would theoretically account for unlimited progressive degeneration, but is the only view so far examined that does not on the face of it present serious objections.

An underground laboratory for the study of cave animals has been established by M. Viré in the old catacombs and underground quarries extending under the Jardin des Plantes in Paris. Here are all the conditions of a cave, namely, perpetual darkness, an unvarying temperature, and running water for aquatic forms. M. Viré has introduced various blind and eyed species, and eventually we may expect to have much light thrown on the interesting problems suggested by such studies as these. Great activity has been shown in France in the exploration of the caves and subterranean streams of the Midi; and a Société de Spéléologie has been organized for several years.

papers. Consult also the writings of Tellkampff, Schiodte, Cope, Putnam, Garman, Henshaw, Joseph, Chilton, and others.

ALPHEUS S. PACKARD,
Brown University, Providence, R. I.

Cave-bear, an extinct species of European bear closely allied to the living grizzly, but attaining a larger size. Its remains are found in bone-beds in caverns, whence the name. The habits of the animal were probably not different from those of modern bears. The cave-bear of South America is a different animal (see *ARCTOTHERIUM*). Both species are found in the larger caverns of North and South America.

Cave-dwellers, prehistoric men dwelling in caves, and cave-dwelling animals of corresponding periods; also cave-dwelling men of more recent historic times. Long before the dawn of authentic history, primitive races of men dwelt in large numbers in natural caverns, which were often shaped, enlarged, fortified, or furnished by the occupants. The ages in which the prehistoric cave-dwellers lived are usually called the Palæolithic, or Ancient Stone Age, and the Neolithic, or Later Stone Age. Many caves have been explored in England, France, Belgium, Spain, America, and Australia; notably a famous cave known as Kent's Hole, in Devonshire, England, caves at Brixham and Périgord, and the Madeleine Cave on the Vézère River, France. In the Neolithic Age numerous human skeletons are found, but very few in the earlier age. It is believed that some of these human remains possibly antedate the glacial drift period of Europe. The remains found in the caves are ordinarily overlaid with deposits of varying thickness and different qualities. In Kent's Hole, near Torquay, there were found four distinct strata of deposits overlying the cavern floor: the surface layer a dark earth containing Neolithic and Roman remains, the second layer a thin stalagmite floor, the third a stratum of red earth containing flint implements and bones of animals, and the lowest deposit consisting of a hard breccia, in which human and animal remains of a ruder and earlier period were found.

Caves in which the bones of extinct animals are found owe their origin, for the most part, to the action of rain-water on limestone rocks, in which they most frequently occur. The deposit contained in these caverns usually consists of clay, sand, and gravel combined. In this deposit are imbedded remains of animals, and stones either angular or rounded. The bones scarcely ever occur in entire skeletons, but are scattered in such a way as to show that they must have been moved from their places subsequent to the death of the animals. They seldom, however, have suffered much from friction; and at times look so fresh that, but for the complete abstraction of the animal matter which they must have originally contained, they might be supposed to have been brought into the cavern a few weeks before. The most remarkable fact with regard to these bones is that the most of them belong to animals which do not now exist at all, or exist only in regions far remote from those where caverns occur. Some of those found in European caverns belong to animals now found only in the tropical or sub-tropical regions, and others are the re-

CAVE-TEMPLE — CAVEAT

mains of animals now living in more northerly areas, while others, although evidently molded on types similar to those of existing animals, differ from them in several essential features. To add to the difficulty of explanation, human bones have repeatedly been found mingled with those of the lower animals. The evidence of the cave remains proves the co-existence of man with animals not now living in the same areas; of these animals some are now extinct, as the cave-bear (q.v.) and cave-lion, the mammoth, and mastodon, the tichorhine rhinoceros, etc.; others have only migrated. Thus the reindeer is no longer found in southern Europe; the *Hyæna crocuta*, found in the Gibraltar caves, now lives in South Africa. The ibex, the chamois, and a species of ground-squirrel, once lived in the Dordogne, but are now found only on the heights of the Alps and Pyrenees. Thus it is evident that a considerable change of climate has taken place in Europe. Man's relation to these extinct animals, and his existence at the time these changes took place, are demonstrated by the discovery in the caves of human bones and worked flints beneath layers of hyæna droppings, as in Wokey's Hole, near Wells; mixed up indiscriminately, as in Kent's Hole, with bones of elephant, rhinoceros, hyæna, etc.; and by the fact that many bones of the extinct animals are split up, evidently for the sake of the marrow. In the Dordogne and Savigné caves fragments of horn have been found bearing carved—or, rather, deeply scratched—outline figures of ibex, reindeer, and mammoth. The bones of the reindeer are found in large numbers, some of them showing that the flesh had probably been cooked. It is believed that this animal was a chief article of food with the cave-dwellers. Implements of flint and stone are mingled with the remains. Among the non-extinct animals known to have dwelt in the caves with men, or to have been carried there for food, or to furnish their skins for clothing, are the mammoth, musk-ox, horse, dog, bison, rhinoceros, and hyæna. In 1820 Dr. Buckland explored a cave at Kirkdale, in Yorkshire, England, and proved that it had been inhabited by great numbers of hyænas that had dragged into it many other animals. Among the remains found in Europe nothing has been shown to indicate that the cave-dwellers domesticated any animals, or used them for anything but food and clothing. Needles of ivory are found, leading to the inference that they knew how to sew skins together for garments. No traces of agriculture, and no implements used in agriculture, have been discovered. Lance-heads, arrow-heads, hammers, saws made of flint, and harpoons, have been found. The great number of fish-bones found, showing marks of cookery, indicates that they engaged in fishing extensively, but the variety of bird remains indicates their inferior skill in catching or killing winged creatures. They probably had no spinning implements and did not know the art of pottery.

In the cave of Cro-Magnon in the south of France skeletons were found that are accepted by palæontologists as those of genuine cave-men. Taking them as the type, it is inferred that the Palæolithic cave-dwellers were a tall, powerfully built race, with long narrow skulls, broad faces, and powerful jaws. Investigations in the Belgian caves seem to indicate that the cave-men of that region were of much smaller

stature, but with symmetrical, well-shaped bodies. The traces of the most ancient cave-men found in Europe are believed to identify them ethnically with the Esquimaux. The bone needles, harpoons, arrow- and spear-heads, and scrapers, are much like those of the Esquimaux. The designs of their carvings also are much the same, as well as their habit of accumulating piles of bones around their dwellings, which they were accustomed to split for the marrow. The habitat of animals now common in the Arctic region, where the Esquimaux live, has shifted to the north, and their migration has been traced with the subsidence of climates, from Europe to the regions where the species that have survived now live. It is believed that the Esquimaux in the same way is the descendant of the Palæolithic cave-dweller, who has gradually receded to the north.

The caves belonging to the Neolithic Age yield remains classified into three ages: Neolithic (proper), Bronze, and Iron. They are widely distributed throughout Europe, and contain celts, flints, flakes, rude pottery, bones of the pig, dog, horse, sheep, and goat, with those of many wild animals still indigenous in Europe, and of some that are extinct, and many human skeletons. The latter show that the people populated the caves in great numbers. They were a race of short-statured people having common resemblances in various regions of Europe. They were in some regions cannibals, and slightly in advance of the Palæolithic races in the variety of their implements and occupations. Their gradual progress down to the dawn of history is shown by the substitution of bronze, and then of iron, in place of the stone of earlier ages for implements and weapons.

In America, caves with human remains have been investigated in Brazil, Ohio, Kentucky, Minnesota, Arizona, Colorado, Nevada, Utah, and California. There are remains that have been deposited within the period of authentic history. The conclusions drawn from cave remains, as to the antiquity of man, are subject to the doubts that beset all calculations as to the rate of deposit of geological strata and to the rapidity of changes in climates and zoological characteristics. See MOUND-BUILDERS.

Cave-temple, a cave used as a temple; but the name is especially applied to temples excavated in the solid rock, such as exist in considerable numbers in India.

Caveat, kâ'vê-ăt (Lat. "let him beware") in law, a notice served upon a public officer or court to refrain from doing a certain act without first giving notice to the caveator, as the person is termed who enters the caveat. Perhaps the best-known use of the caveat is its entry by an inventor in the Patent Office for the purpose of establishing his claim to priority of invention, by enjoining its officers from issuing letters patent for any invention interfering with or infringing the rights claimed by the caveator, without first giving him notice of the application for such letters patent. The terms of the caveat must set forth the claims of the inventor and the details of his invention with sufficient particularity to enable the officials of the Patent Office to determine whether a subsequent application for letters falls within the claims of the first inventor. If such is the case the caveator is entitled to notice of such inter-

CAVEAT EMPTOR — CAVENDISH

fering application, and the new applicant's claim to letters is suspended for three months, during which period the caveator must complete his specifications and file his own application for letters patent. If no interfering application is filed, the caveator's rights remain valid for one year, and may be renewed at the end of that term, for one year more, on payment of a second fee. Other uses of the caveat are to prohibit (without notice to the caveator) the admission of a will to probate, the enrollment of a decree in chancery, the grant of letters testamentary to an executor, the issuing of a commission *de lunatico inquirendo*, etc. On the filing of such a caveat and due notice being served thereunder, a hearing is had before a competent tribunal for the determination of the rights in the matter.

Caveat Emptor, a rule of law that warns the purchaser to take care and examine properly before he buys it. In sales of real estate the purchaser's right to relief depends on the covenants in the deed in the absence of fraud on the part of the vendor. In 1 Serg. & R. 42, the rule is stated as follows:

"The rule of *caveat emptor* strictly applies to the purchase of lands, and the consideration-money cannot be recovered back after a deed executed, unless in case of fraud, where some covenant inserted in the deed has been broken. The purchaser has it in his power to protect himself by proper covenants, and there is no reason why the law should provide to him a remedy, where he himself has been wholly inattentive and negligent in this particular."

In sales of personal property the purchaser buys at his own risk, in the absence of an express warranty by the seller, or when the law does not imply a warranty from the circumstances of the sale or the nature of the thing sold, and when the seller was not guilty of a fraudulent misrepresentation or concealment. The purchaser must examine the quality of the goods bought and rely upon his own judgment. Generally, if the article purchased is defective, and an examination, such as a reasonable and prudent man would make, would enable him to see the defect, it is not a fraud on the part of the seller not to call his attention to it.

At common law in the city of London, the law of market overt applied to all stores where articles in that particular line were sold. The purchaser got a good title, but as to the quality the purchaser must examine and judge for himself, unless the seller give him an express warranty.

Cavedone, Jacopo, yā'kō-pō kā-vē-dō'nā, Italian painter: b. Sassuolo, in the duchy of Modena, 1577; d. Bologna 1660. He was a pupil of Annibale Carracci. His best works are the 'St. Alo,' in the church of the Mendicanti at Bologna, the 'Adoration of the Magi,' the 'Four Doctors,' and the 'Last Supper.' Out of Italy he is frequently mistaken for Annibale Carracci.

Ca'ven, William, Canadian educator: b. Kirkcolum, Scotland, 26 Dec. 1830. He went to Canada with his father in 1847, studied theology at London, Ont., was ordained minister of the United Presbyterian Church, 1852, and was pastor of St. Mary's and Downie, 1852-65. In 1866 he became professor of exegetical theology and biblical criticism in Knox College, Toronto, and principal in 1873, having been chairman of the college board since 1870. He was a pro-

motor of the union of the Canadian Presbyterian churches, moderator of the Church in 1875, and president of the Ontario Teachers' Association, 1877.

Cavendish, kāv'en-dish or kăn'dish, Frederick Charles, LORD, second son of the 7th Duke of Devonshire, English statesman: b. Eastbourne 30 Nov. 1836; d. 6 May 1882. He sat in Parliament as Liberal member for the north division of the West Riding of Yorkshire from 1865 till the spring of 1882, when he succeeded Mr. Forster as chief secretary for Ireland. On the evening of 6 May, he and Mr. Burke, an unpopular subordinate, were stabbed to death in the Phoenix Park. Eight months later, 20 "Irish Invincibles" were tried for the murder, and, Carey and two others having turned queen's evidence, five of the rest were hanged, three sentenced to penal servitude for life, and the remaining nine to various terms of imprisonment. Carey himself disappeared; but in July news came from the Cape that he had been shot dead by an Irishman named O'Donnell on board an emigrant ship. O'Donnell was taken back to London and hanged.

Cavendish, George, English biographer: b. about 1500; d. about 1561. He became Wolsey's gentleman-usher at least as early as 1527. He remained in close attendance upon his great master till the latter's death, 28 Nov. 1530, after which he retired to his house at Glemsford, in Suffolk, where he lived quietly with his wife, a niece of Sir Thomas More, till the close of his own life. His affection for the great cardinal was most devoted, and his 'Life of Cardinal Wolsey' is one of the most interesting short biographies in the English language.

Cavendish, Henry, English chemist: b. Nice, Italy, 10 Oct. 1731; d. London 24 Feb. 1810. He was a grandson of the second Duke of Devonshire, and after his education at Peterhouse College, Cambridge, devoted himself exclusively to scientific research. He discovered the peculiar properties of hydrogen, and the qualities by which it is distinguished from atmospheric air. To him we owe the important discovery of the composition of water. Scheele had already observed that, when oxygen is mixed with double the quantity of hydrogen, this mixture burns with an explosion without any visible residuum. Cavendish repeated this experiment with the accuracy for which he was distinguished. He confined both the gases in dry earthen vessels, to prevent the escape of the product of their combustion, and found that this residuum was water, the weight of which was equal to the sum of the weights of the two gases. Lavoisier confirmed this conclusion in later times. Cavendish possessed a profound knowledge of the higher geometry, of which he made a very happy use in determining the mean density of the earth. He found it to be five and a third times greater than the density of water — a conclusion which differs but little from that obtained by Maskelyne in another way. Coulomb investigated the law of attraction between two electrified points directly by means of the torsion balance. Cavendish was, however, the author of the far more exact method of proving the law, which he expressed in the following syllogistic form. He demonstrates mathematically that, if the law of force be any other than the inverse square of the distance, electricity

could not rest in equilibrium *at the surface* of a conductor. But experiment has shown that electricity does rest in equilibrium on the surface of a conductor. Hence the law of force must be the inverse square of the distance. He himself made excellent experiments in order to support his minor premise. He did not, however, consider that his experiments justified him in holding the truth of it as thoroughly established, though he believed it to be true. Since his time the experimental researches of Faraday and others have completely demonstrated the truth of it, and therefore of the law above stated. Cavendish was a member of the Royal Society of London, and in 1803 was made one of the eight foreign members of the National Institute of France. His writings consist of treatises in the 'Philosophical Transactions,' from 1766 to 1792. They are distinguished by acuteness and accuracy.

Cavendish, Margaret, DUCHESS OF NEWCASTLE, English writer: b. Essex 1624 (?); d. 1674. She wrote 'Philosophical Fancies'; a collection of poems, 'The Pastime and Recreation of the Queen of Fairies'; 'Philosophical Letters' (1664).

Cavendish, or Candish, Sir Thomas, English navigator: b. Trimley Saint Martin, Suffolk, about 1555; d. at sea off Ascension Island, 1592. Having consumed his property by his early extravagances, he collected three small vessels for the purpose of making a predatory voyage to the Spanish colonies. He sailed from Plymouth in 1586, took and destroyed many vessels, ravaged the coasts of Chile, Peru, and New Spain, and returned by the Cape of Good Hope, having circumnavigated the globe in two years and 49 days, the shortest period in which it had then been effected. For this exploit he was knighted by the queen. In 1591 he set sail on a similar expedition, in which his principal success was the capture of the town of Santos, in Brazil.

Cavendish, William, Duke of Newcastle, English general: b. 1592; d. 25 Dec. 1676. On the approach of hostilities between the Crown and Parliament he embraced the royal cause, and was invested with a commission constituting him general of all his majesty's forces raised north of the Trent, with very ample powers. Through great exertions, and the expenditure of large sums from his private fortune, he levied a considerable army, with which, for some time, he maintained the king's cause in the north. In military matters he depended chiefly on his principal officers, it is said, but the numerous successes obtained by him render this unlikely. In 1643 he obtained a complete victory over Lord Fairfax on Adwalton Moor, and recovered all Yorkshire except Hull; but next year, on the arrival of the Scottish army and its junction with the parliamentary forces, threw himself into York. Having been relieved by Prince Rupert, he was present at the battle of Marston Moor next day, after which he left the kingdom. His term of exile was chiefly spent in Antwerp, where he was for a time so straitened in circumstances that he had on one occasion to pawn his wife's jewels. He returned, after an absence of 18 years, and was rewarded for his services and sufferings with the dignity of duke. His works include 'La Methode et Invention Nouvelle de dresser les Chevaux' (Antwerp 1657); 'A New Method and Extraordinary

Invention to Dress Horses, etc.' (1667); some comedies of no merit; and several worthless poems.

Cavendish, William, English statesman: b. 25 Jan. 1640; d. 18 Aug. 1707. He was first Duke of Devonshire, was the son of William, third Earl of Devonshire, and was instructed with great care in classical literature. On various occasions he distinguished himself by his spirit and valor, and in 1677 began that opposition to the arbitrary measures of the ministers of Charles II. which caused him to be regarded as one of the most determined friends of the liberties of his country. Intimately connected with Lord Russell, he joined him in his efforts for the security of free government and the Protestant religion. On the trial of Lord Russell he appeared as a witness in his favor, and offered to assist him in escaping, after he had been sentenced to death, by changing clothes with him in prison. In 1684, having succeeded to his father's title, and being regarded as one of the most formidable opponents of the arbitrary designs of King James II., attempts were made to intimidate him, but without success. He took an active part in promoting the revolution, and was one of the first who declared for the Prince of Orange. His services were rewarded with the dignity of Duke of Devonshire. He still, however, maintained an independent bearing in Parliament.

Cavendish. See JONES, HENRY.

Cav'endish, tobacco which has been softened and pressed into quadrangular cakes, so called after Thomas Cavendish, the Elizabethan circumnavigator.

Cavendish Experiment. See GRAVITATION.

Ca'verypauk, India, a town of Hindustan, in the North Arcot division of Madras Presidency, 57 miles west-southwest of Madras. It is meanly built, and the adjoining fort, at one time a place of some strength, is now in ruins. A victory was gained here by the British under Clive over the French and their allies in 1752. Near the town is an immense artificial pond, eight miles long by three miles broad, by means of which a large tract of country is irrigated. It is perhaps the finest work of the kind in South India. Pop 7,000.

Caviana, kä-vē-a'nā, Brazil, an island 35 miles long and 20 miles wide. It lies in the north mouth of the Amazon, under the equator; is level, fertile, and well stocked with cattle. The small town of Roberdello is on its southeastern side.

Caviare, kä-v-ī-ä'r', a table delicacy prepared from the roe of the sturgeon, *Acipenser sturio* or *A. huso*. It is made in great quantities in Russia, especially at Astrakhan, where great quantities of sturgeon are caught in the Volga, and of late years the industry has developed in some of the western States of America. The roe is separated from the skin which encloses it, washed in vinegar, and dried in the sun. A quantity of salt is then rubbed in by hand, and the roe is put into a cloth and pressed to remove the liquor, after which it is packed in small kegs for the market.

Cavite, kä-vē'tā, Philippines, a province in the southwestern part of the island of Luzon, bounded on the north and northwest by Manila Bay, on the north and northeast by the province

of Manila, and on the south by Batangas; area, 510 square miles, with the dependent islands, 610 square miles. In the south and southwest the province is mountainous; in the northwest there is a gradual elevation, forming a fertile plateau. The chief products are coffee, sugar, fruits, and rice (in the lowland regions). In the towns of the interior, hemp and cotton cloth, and sugar are manufactured; in the coast towns the chief industries are salt manufacture and fishing. There is export trade in all these products. There is communication with Manila by water and good roads throughout the province, connecting the coast with the interior. The occupation of Cavite by United States troops was the first event of importance in the Philippines after the naval battle in Manila Bay, 1 May 1898. The government of the province was established under the provincial government act of 6 Feb. 1901; and later several of the dependent islands were added to the territory in Luzon. Pop. 134,500.

Cavite, Philippines, a town and capital of the province of Cavite, on the eastern shore of Manila Bay. A tongue of land about one and a quarter miles long, projecting due east, separates waters of Cañacao Bay on the north, and Bacoor Bay, inner harbor of Cavite, on the south. On this projection are situated fortifications and arsenal. The town is walled, and all the buildings are of stone; it has a parochial church, two convents, and a hospital. It has also several manufacturing industries, and is well equipped for building and repairing vessels. The Spanish fleet had its position off Cavite when attacked by Admiral Dewey on 1 May 1898. The town is the naval headquarters of the United States in the Philippines. Pop. 3,000.

Cavo Relievo, Sculpture in; called also **Coelanaglyphic** and **Concavo-convex Sculpture**, a system of relief in which the figures do not rise above the general surface of the stone, ivory or other material on which the carving is done. It may be looked upon as sculpture in relief, of which the background has not been cleared away in the usual manner. Again, it may be considered as sculpture of which the bounding line has been marked by a groove, generally wedge-shaped, that is with a section like a V: the slope of one side being left as the boundary of the pattern or design, while the other slope disappears in the general rounding of the figures. This sculpture, in architectural art, is almost confined to the Egyptian buildings of times before the Roman domination; but in minor decorative arts the Orientals do beautiful work in this way.

Cavour, kã-voor', **Camillo Benso**, COUNT DE, Italian statesman: b. Turin 10 Aug. 1810; d. 6 June 1861. He was educated in the military academy at Turin, and after completing his studies he made a journey to England, where he made himself acquainted with the principles and working of the constitution. In 1842 he returned to Turin, where shortly afterward he published in the 'Bibliothèque Universelle' of Geneva his 'Considerations on the Present State and Future Prospects of Ireland,' which were subsequently translated into English. With Count Balbo and others he established in 1847 the journal of the 'Risorgimento.' It was not, however, till after the battle of Novara that he entered that political arena in which his name has since become so famous.

He became a member of the Sardinian Chamber of Deputies in 1849, and the following year succeeded Santa Rosa as minister of commerce and agriculture. In this office he set himself strenuously to promote the internal prosperity of the country by the establishment of railways and an improved system of postal communications. A new organization was given to the military and naval forces; and the monasteries were, with certain exceptions, suppressed. In November 1852 Cavour became premier, and not long afterward gave a signal proof of his statesmanship by the part which he took in cementing an alliance with Great Britain and France, and making common cause with these powers against the aggressions of Russia. The prestige thus gained to the arms of Sardinia was no less important than that acquired by her liberal and reforming policy in civil matters. The attitude, however, thus taken by Sardinia could not fail to prove extremely offensive to the neighboring power of Austria, to whose arbitrary and repressive measures the government of Victor Emmanuel displayed itself as a standing reproach, and whose supremacy in Italy was eminently jeopardized by the aspirations of Sardinia. A collision, therefore, was inevitable, resulting in the campaign of 1859. The intimate connection formed at that time with France, who lent her powerful assistance in the prosecution of the war, was mainly due to the agency of Cavour, who was accused by some on this occasion of having purchased the assistance of Louis Napoleon by unduly countenancing his ambitious projects. The marriage of Victor Emmanuel's daughter, the Princess Clotilde, with Prince Napoleon, was consummated in the early part of 1859, and the conclusion of the same year witnessed the cession of Nice and Savoy to France. In bringing about both of these results Cavour took a leading part. In 1860 Garibaldi's expedition to Sicily took place; but toward this and the subsequent movements of the Italian liberator, Count Cavour manifested an apparent coldness, which diminished somewhat his estimation in the minds of the more zealous Italian patriots. See Romilly, 'Reminiscences of the Life of Cavour' (1863); Dicey, 'Cavour: a Memoir'; Bianchi, 'La Politique de Cavour' (1885); 'Lives' by Massari (1873); Mazade (1877); Martinengo-Caesaresco (1897).

Cavy, kã'vi, a small rodent of the family *Caviidae*, related to the paca and aguti, and characterized by its stout build, short legs, small ears, pink eyes, and total absence of a tail. Caves are semi-nocturnal animals; feed upon roots and vegetable fare, and are widely distributed throughout the plains and unforested highlands of South America. The only domesticated and familiar species is the much modified guinea-pig (q.v.), which is about eight inches long, and owing to its harmlessness, is a great household pet among children. The largest species of cavy (*C. patchonica*), wrongly called "agouti," is scantily distributed throughout the plains of Argentina. It is rusty red in color, and about the size of a hare, standing on terrier-like legs. The "restless" cavy (*C. porcellus*), and Cutler's cavy (*C. cutleri*), are common in the La Plata valley, and are uniformly colored with grayish-brown or black. Other species are found in Brazil and Bolivia.

CAWDOR — CAXTON

Cavies live in burrows of their own digging, and breed twice a year, the number of young varying with the climate. The young are brought forth in a very advanced state of development. Their eyes are open and they are capable of running by the side of their mother in a few hours' time. In less than a fortnight they are quite able to care for themselves. Consult: Hudson, 'Naturalist in La Plata'; and Lydekker, 'Standard Natural History.'

Cawdor, kô'dër, Scotland, a village in Nairnshire, 5½ miles southwest of Nairn. Cawdor Castle, near by, the seat of the Earl of Cawdor, was founded in 1454, but is one of the three places which tradition has assigned as the scene of King Duncan's murder by Macbeth in 1040. A series of papers from the charter-room at Cawdor was edited (1859) by Cosmos Innes under the title of 'The Book of the Thanes of Cawdor.'

Cawdor, Thane of, in Shakespeare's 'Macbeth,' a character who does not appear upon the stage. On account of his alliance with the Northmen he is condemned to death by Duncan, who calls him "that most disloyal traitor." His title is given to Macbeth, in accordance with the prophecy of the witches. In describing his death it is thought that Shakespeare had reference to the execution of the Earl of Essex.

Cawein, kaw'ën, **Madison Julius**, American poet: b. Louisville, Ky., 23 March 1865. His verse is often exceedingly musical and displays great command of metres. Its defects are over ornamentation, and a too profuse employment of adjectives, but the note which he strikes is distinctive and pleasing. He is at his best in his purely Kentuckian poems. His works include: 'Blooms of the Berry' (1887); 'The Triumph of Music' (1888); 'Accolon of Gaul' (1889); 'Lyrics and Idyls' (1890); 'Days and Dreams' (1891); 'Moods and Memories' (1892); 'Intimations of the Beautiful' (1894); 'Poems of Nature and Love' (1893); 'Red Leaves and Roses' (1893); 'Undertones' (1895); 'The Garden of Dreams' (1896); 'Shapes and Shadows' (1898); 'Idyllic Monologues' (1898); 'Myth and Romance' (1899); 'One Day and Another' (1901); 'Weeds by the Wall' (1902).

Cawnpore, kôn-pôr, or **Cawnpur**, kôn-poor', India, capital city of the district of the same name, in the Northwest Provinces, on the right bank of the Ganges, which is here about a mile wide, 130 miles northwest from Allahabad. It is a modern town with nothing specially noteworthy about it as regards site or buildings. There are several churches, a theatre, various military and other offices, high school, club, etc. It manufactures leather and cotton goods, has a large trade, and is an important railway centre. In 1857 the native regiments stationed here mutinied and marched off, placing themselves under the command of the Rajah of Bithur, the notorious Nana Sahib. Gen. Wheeler, the commander of the European forces, defended his position for some days with great gallantry, but, pressed by famine and loss of men, was at length induced to surrender to the rebels on condition of his party being allowed to quit the place uninjured. This was agreed to; but after the Euro-

pean troops, with the women and children, had been embarked in boats on the Ganges, they were treacherously fired on by the rebel; many were killed, and the remainder conveyed back to the city, where the men were massacred and the women and children placed in confinement. The approach of Gen. Havelock to Cawnpore roused the brutal instincts of the Nana, and he ordered his prisoners to be slaughtered, and their bodies to be thrown into a well. The following day he was obliged, by the victorious progress of Havelock, to retreat to Bithur. A memorial has since been erected over the well in the form of an angel with palm branches, and fine public gardens, covering 50 acres, now surround the spot. Including the native city, cantonments, and civil station, it had in 1901 a population of about 197,000.

Caxamarca. See CAJAMARCA.

Caxias, kâ-shê-äs', the name of two places in Brazil: (1) A town in the state of Maranhão, on the navigable Itapicuru, 190 miles from its mouth, with an active trade in cotton. Pop. 10,000. (2) An Italian agricultural colony in the Brazilian state of Rio Grande do Sul, founded in 1875. Pop. 13,680.

Caxton, William, first English printer: b. Kent about 1422; d. London 1491. In 1438 he was bound apprentice to Robert Large, a mercer in London, and soon after his master's death (1441) he went to Bruges, where, in 1446, he went into business on his own account. About 1463 he was appointed "governor" at Bruges for the English merchants settled in the Low Countries, a post in which he continued for some years. About 1471 Caxton entered the service of Margaret, Duchess of Burgundy, sister of Edward IV. He had already begun a translation of the popular romance entitled 'Le Recueil des Histoires de Troye,' and this he finished at Cologne in 1471. In order to meet the demand for the book he learned the art of printing, probably at Cologne, and his 'Recuyell of the Histories of Troy,' the first English printed book, appeared about 1474, having issued, it is supposed, from the press of Colard Mansion at Bruges. His 'Game and Playe of the Chesse,' also a translation from the French, was probably a production of the same press in 1475, and is the second English book printed. He left Bruges in 1476, returned to England, and in 1477 had a press at Westminster Abbey, where he printed the 'Dictes and Sayings of the Philosophers,' the first typographical work executed in England. Caxton continued to exercise his art for about 14 years, during which time he produced nearly 80 works, many of them translated by himself from the French, and one of them — 'Reynard the Fox' — from the Dutch. He was patronized by Edward IV., Richard III., and Henry VII.; and he was on intimate terms with Earl Rivers, the Earl of Worcester, and others of the nobility, the two noblemen named having even translated works for his press. He was buried in the Church of St. Margaret's, Westminster. Besides the books already mentioned, Caxton printed Chaucer's 'Canterbury Tales'; 'Troilus and Creside'; 'Book of Fame,' and translation of Boethius; Gower's 'Confessio Amantis'; works by Lydgate; Malory's 'King Arthur'; 'The Golden Legend'; 'The Fables of Æsop,' etc. His books have

CAXTONS—CAYLEYAN

no title pages, but are frequently provided with prologues and colophons. His types are in the Gothic character, and copied so closely from the handwriting of his time that many of his books have been mistaken for manuscript. In some no punctuation is used; in others the full point and colon only; commas are represented by a long or short upright line. Copies of some of his books now bring extraordinary prices when sold. The standard 'Life of Caxton' is that by W. Blades (1861-3).

Caxtons, The, a novel by Edward Bulwer, Lord Lytton, published in 1850. 'The Caxtons' was not only instantly popular in England, but 35,000 copies were sold in America within three years after its publication in 1850. Never before had Bulwer written with so light a touch and so gentle a humor, and this novel has been called the most brilliant and attractive of his productions. His gentle satire of certain phases of political life was founded, doubtless, on actual experience.

Cayambe'-Urcu, *kā-yām-bā'-oor'koo*, or **Cayambe'**, a summit of the Colombian Andes, lying directly under the equator in Ecuador. It rises in the shape of a beautiful and regular cone to a height of 19,187 feet. Its top is crowned with perpetual snow, and its geographical position and great elevation render it one of the most remarkable mountains of the world.

Cayenne, *kā-yēn'* or *kī-ēn'*, French Guiana, a city and capital of the colony, situated in lat. 4° 56' N., lon. 52° 20' W. The first casual occupants were the Dutch, at the beginning of the 17th century. The French, under Charles Poncet, settling here, as well as at other points on the Guiana coast, 20 years later, were driven out by the natives, but undertook another expedition in 1643. Again unsuccessful, they made a third futile effort in 1652; then they deserted the town. The Dutch re-occupied it, but were obliged to surrender possession to a new French expedition. After the Treaty of Breda the Dutch once more took Cayenne, and were attacked there by the French in 1676. The French settlement was permanently established at the beginning of the 18th century. Present population, about 10,000, of whom more than half are convicts, including the negroes, Anamites, and Arabs, transported for crimes committed in the French, African and Asiatic colonies. White criminals have in recent years been sent elsewhere, as a rule, but Alfred Dreyfus, captain in the French army, after his conviction of treason in December 1894, was condemned to solitary confinement on the Ile du Diable, a remote outpost of the Cayenne penal settlement (27 miles away, off the northwest coast), and there remained until taken back to France for a new trial. The climate of the capital, which is built on an island east of the mouth of the Cayenne River, is rendered exceedingly unwholesome by the low and swampy character of a part of the neighboring coast. The harbor is shallow, yet the products of the country—gold, sugar, molasses, rum, coffee, hides, spices, cocoa, etc.—are shipped in considerable quantities each year. The recent discovery of diamonds (1900-3) in the interior of the Guianas suggests a possible development of trade, and a better use of American territory in the future. See **GUIANA**.

Cayenne Pepper, or **Capsicum**, a powder formed of the dried and ground fruits, and more especially the seeds, of various species of *Capsicum*, and especially of *C. frutescens*. It is employed as a condiment to improve the flavor of food, aid digestion, and prevent flatulence. In medicine it is used as a stimulant, and is a valuable gargle for a relaxed throat. See **CAPSICUM**.

Cayes, kā, Les. See **AUX CAYES**.

Cayley, kā'lī, Arthur, English mathematician: b. Richmond, Surrey, 16 Aug. 1821; d. London 26 Jan. 1895. He received his early education at Blackheath and King's College, London, passing subsequently to Trinity College, Cambridge. Called to the bar in 1849, he practised for some years as a conveyancer, but in 1863 was appointed first Sadlerian professor of pure mathematics at Cambridge. Trinity College in 1875 accorded him the rare honor of electing him a Foundation Fellow. He received many distinctions from universities and learned societies both at home and abroad, and in 1883 he presided over the meeting of the British Association at Southport. He seldom identified himself with movements outside his own immediate work, but took a prominent part in the agitation for the higher education of women, which resulted in the foundation of Newnham College. As a mathematician he was characterized by the wide scope and originality of his work. His chief memoirs deal with differential equations, elliptic functions, and determinants. His 'Elementary Treatise on Elliptic Functions' appeared in 1876, and 'Single and Double Theta-functions' in 1881; and in 1889, a collected edition of his papers began to be issued, extending over a number of volumes. In 1882 he lectured in Johns Hopkins University, Baltimore.

Cayley, Sir George, English scientist: b. Brompton, Yorkshire, 1773; d. 15 Dec. 1857. His genius first displayed itself in the analysis of the mechanical properties of air under chemical and physical action. His papers on the subject gave rise to many experiments on the navigation of balloons at home and abroad. His experiments on the steam engine led to his invention of the air engine. His discoveries in optics were followed by the invention of an instrument for testing the purity of water by the abstraction of light. He was also the inventor of an ingenious arrangement for obtaining and applying electric power to machinery. He was one of the original promoters of the polytechnic institution at London. Toward the end of the 19th century he applied to his extensive estates in Yorkshire a new system of arterial drainage. He was also the father of the cottage allotment system. As a politician, he took a prominent part in the election of liberal members of Parliament, and the return of Brougham was chiefly due to his sympathy with the reform bill. Upon the passing of that bill he was himself chosen as member for Scarborough, but on account of his advanced age, soon retired.

Cayleyan, *kā'lē-an*, in mathematics, the name for a family of curves investigated by Prof. Cayley, of Cambridge, and by him called *pip-pians*. The Cayleyan is of the sixth order, and is exhibited as the envelope of right lines, considered in couples, which are polar conics of the general curve of the third order. In Cayley's

CAYLUS — CAYVAN

notation, if the cubic is $U = (*) (x, y, z)^3 = 0$ then $P U = 0$ is the Cayleyan. See Cayley, 'Collected Mathematical Papers,' Vol. I., p. 183, and Vol. II., p. 381.

Caylus, Anne Claude Philippe de Tubières, *ân klöd fê-lêp dè tü-bê-âr kâ-lus*, COUNT OF, French archæologist: b. Paris 31 Oct. 1692; d. there 5 Sept. 1765. He was a son of the Marquise de Caylus (q.v.), and after having served in the army during the war of the Spanish succession, he left the service in 1715, accompanied Bonac on his embassy to Constantinople the following year, and visited Greece, Troy, Ephesus, Byzantium, and Adrianople. In 1717 he returned to Paris, and began the arrangement of his extensive collections. He commenced a great work on Egyptian, Grecian, Etruscan, Roman, and Gallic antiquities, with numerous plates. He was a member of the Academy of Painting and of the Academy of Inscriptions, and divided his labors between them. He made a chemical examination of the ancient method of encaustic painting, investigated the mode of painting on marble, the art of hardening copper, the mode by which the Egyptians raised great weights, the mummies, painting on wax, and many other subjects. Integrity, simplicity, and disinterestedness were united in his character, with occasional traits of dogmatism. He has left numerous works, tales as well as antiquarian researches. Among the latter is his 'Recueil d'Antiquités Égyptiennes' (1752-67, 7 vols.). Caylus was also an industrious and skilful engraver, and produced a collection of more than 200 engravings, after drawings in the royal cabinet, and a great number of heads, after the first masters.

Caylus, Marthe Marguerite de Villette, *mar-tê mar ger êt dè vèl-êt*, MARQUISE DE, French writer of memoirs: b. Poitou 1673; d. Paris (?) 15 April 1729. Long an ornament of the brilliant court of Louis XIV., she passed her declining years in dictating 'My Recollections,' in which a valuable insight into the life of Louis XIV. is afforded, through the medium of a singularly happy style.

Cayman, kâ-mân, or Caiman, kâ-ê-mân, any of five species of alligators inhabiting the fresh waters of Central and South America. The caymans are distinguished from other alligators in having an armor of overlapping bony scutes protecting the belly, as well as an armor of bony plates on the back. The black cayman (*Caiman nîcr*) of tropical South America east of the Andes is the largest species, reaching a length of 13 feet. In some of the rivers of South America caymans are found in vast numbers and are said to be extremely voracious.

Caymans, The, or Cayman Islands, three islands situated in the Caribbean Sea, about 140 miles northwest of Jamaica, of which they are dependencies. Grand Cayman, the largest of the three, is 17 miles long, and from 4 to 7 broad. It is well wooded. The natives are chiefly employed in agricultural operations or in trading with Jamaica and other places. They cultivate sugarcane and vegetables, and raise cattle, pigs, poultry, etc. Turtle and cocoa-nuts are exported. The climate is very healthful. There are several Presbyterian places of worship. A large proportion of the inhabitants are whites. Pop. about 2,500. *Cayman Brac* has about 500 inhab-

itants, mostly white, Little Cayman, 40 or 50, all white.

Cayuga (ka-yoo'gâ) Lake, a lake in the State of New York, on the boundary of Cayuga and Seneca counties, and extending south into Tompkins County, 38 miles long and from 1 to 3½ miles wide. It is much frequented by pleasure parties. The town of Ithaca stands at the southern extremity of the lake.

Cayû'gas ("swamp-dwellers," possibly in reference to their cranberry swamps) a tribe of North American Indians, forming the smallest of the original Five Nations of the Iroquois, and according to Onondaga tradition, the last to join the confederacy; whence it was called "The Youngest Brother." The tribe was not inferior in energy and original genius, however; several of the chiefs were men of superior ability, as Karistagea, or Steeltrap; and Tahgahjute, or "Logan," the son of one of its sachems. The latter will be ever remembered, not only for the pathetic speech attributed to him, but for his high personal qualities. Nor were the Cayugas inferior in fighting prowess: in one of their Virginia campaigns they seem to have destroyed the tribe of Tuteloes, and incorporated with their own tribe the remnant who were not slain. They were friendly to the whites, however, and bore a good reputation. They were located along the Cayuga Lake in central New York, and in the valley of its outlet, the Seneca River. At the outbreak of the Revolution, they joined the Mohawks and Senecas in alliance with the British against the Americans, and shared in the devastation of the property of the patriots during Sullivan's campaign; the most of them settled in Canada with the other Iroquois, 200 remaining in New York, apparently around Niagara. In 1789 they made their first formal cession of territory to the whites, confirming it by a treaty at Fort Stanwix in 1790; in 1795, by a treaty at Cayuga Bridge, they ceded their great reserve in the lake basin and the river valley, retaining only one of four miles square. For these releases they received large money annuities, which they used largely for liquor. In 1806 all the remainder left the reservation and emigrated westward or northward: some joining their brethren in Canada, some going to Sandusky, Ohio, others settling among the Senecas near Buffalo. There are at present about 1,300 in all, the bulk of them at the Six Nations on Grand River, Ontario, some with the Oneidas in Wisconsin, about 170 with the Senecas in New York State, and others with the Senecas in Indian Territory.

Cayuse, kâ-yoos', Cailloux, or Willetpoop, a tribe of North American Indians who formerly inhabited the region between the Des Chutes River and the Blue Mountains, Oregon, and also parts of Washington, south of the Yakima River. There are now only about 415 persons, presumably of Cayuse blood, on the Umatilla reservation.

Cay'van, Georgia, American actress: b. Bath, Maine, 1858. She went on the stage early in life and won note as Dolly Dutton in 'Hazel Kirke.' She was afterward with A. M. Palmer and Daniel Frohman. She became leading lady of the Lyceum Theatre Stock Company in 1897, retiring from the stage soon afterward.

Cayzer, Charles William (CHARLES WHITWORTH WYNNE), English shipowner and poet: b. Bombay 19 July 1869. He was educated at Rugby and Christ Church, Oxford, and has published 'Ad Astra' (1900), a very extensively advertised volume; 'Songs and Lyrics' (1900); 'King David' (1902).

Cazal, Manuel Ayres de, mā'noo-ël ī'rēz dā kā-zāl', Portuguese historian: b. 1754; d. about 1821. He was for a long period prior at Crato, Goyaz, Brazil, devoting himself to historical and geographical research, publishing in 1817, 'Corographia Brasilica, on relação historica-geographica do reino do Brazil,' a much valued work.

Cazalès, Jean Antoine Marie de, zhōñ āñ-twāñ mā-rē dē ka-zā-lās, French politician: b. Grenade, Haute-Garonne, France, 1 Feb. 1758; d. Engalin, Gers, France, 24 Nov. 1805. The son of a counselor of the Toulouse parliament, he served for some time in Jarnac's regiment of dragoons. Being chosen in 1789 a deputy of the noblesse to the States-General, he became one of the most able and eloquent opponents of the Revolution, but was treated with ingratitude by the royalists, although he had labored and suffered much in their cause, and barely escaped being put to death. Having traveled abroad during the reign of terror, he returned to France in 1801. Napoleon conferred on him, although he had refused to enter his service, the cross of the Legion of Honor. His 'Discours et opinions' and his 'Défense de Louis XVI.' were published in 1821.

Cazalla de la Sierra, kā-thāl'yā dā la sē-ēr'ra, Spain, a town in the province of Seville, and 36 miles northeast of the city of Seville, on a declivity of the Sierra Morena. Its streets are clean, paved, and well arranged; and it has two squares, in the principal of which are the ancient church and town-hall. The mountains in the vicinity are rich in metals. Pop. about 9,000.

Cazauran, kā'zō-rān, Augustus R., Franco-American author and playwright: b. Bordeaux, France, 31 Oct. 1820; d. New York 27 Jan. 1889. He was educated at the University of Dublin. In 1848 he became implicated in an Irish rebellion, fled to the United States and obtained employment as a reporter. During the Crimean war he acted as war correspondent to a London daily. Afterward he was connected with the Cincinnati *Enquirer* and became chief editor of the Memphis *Argus*. When Lincoln was shot he was at the theatre as dramatic critic, and wrote the first account of the assassination. In 1869 he went to New York, did dramatic work, and gathered about him a remarkable company of artists. He adapted 'Miss Multon,' 'The Danicheffs,' 'Man of Success,' 'The Mother's Secret,' 'Lillian's Lost Love,' 'The Banker's Daughter,' 'The Celebrated Case,' 'Lost Children,' 'French Flats,' 'Mother and Son,' 'Felicja,' 'The Creole,' 'Daniel Rochat,' 'A Parisian Romance,' and 'The Ranzar.'

Cazembe, kā-zēm'bē, or Cazembe's Dominion, Africa, a region formerly constituting a large and well-ordered negro state lying south and southwest of Lake Tanganyika, and taking its name from the title of the sovereign. The country forms a kind of basin, bounded on the east by a plateau which rises to the height of from 3,000 to 4,000 feet; on the west, also, it

is bounded by a series of heights. On the south it has the lofty watershed which separates its streams from those of the Zambesi River system. Its principal stream is the Chambezi, which flows westward into Lake Bangweolo, then northward, under the name of the Luapula, into Lake Moero. The ruler, or muata, used to be feared as a great magician; he had over 600 wives, and maintained a well-armed body of troops, numbering at one time, it is said, 20,000. His dominions were divided into districts, each of which had a governor of its own. These governors and other men of rank formed a body of privileged nobility; all the rest of the inhabitants, farmers, artisans, etc., were looked upon as slaves of the ruler. The population consisted of a ruling race, the Campololos, who had invaded and conquered the country, and the Mesiras, the original inhabitants. It was only Campololos that received official posts, and the Campololo language was the one spoken at court. The people were industrious agriculturists, growing crops of mandioc, maize, sorghum, etc. They manufactured coarse cloths, cords, nets, lines, etc., from cotton and the fibres of certain plants; made weapons and implements of iron; also earthenware, wooden vessels, etc. Cazembe was visited by Lacerda in 1799, and by other Portuguese explorers in 1831. Dr. Livingstone, in 1867, stayed 40 days at the capital, which he found to consist of a number of huts dotted over a large area, and having probably not more than a thousand inhabitants. The Cazembe at this time was a usurper, whose cruelties had done much to depopulate the country, and it was doubtful if he could bring a thousand warriors into the field. The country, which had been ravaged by the slave trade, now belongs partly to the British sphere of influence, partly to the Congo State.

Cazin, Jean Charles, zhōñ sharl kā-zāñ, French artist: b. Samer, Pas-de-Calais, about 1840. He studied under Le Coq de Boishaudran, obtained a first-class medal at the Salon in 1882 and was made an officer of the Legion of Honor 1889. He is best known as a landscape painter, although frequently introducing figures into his paintings. His coloring and sentiment are much admired.

Cazorla, kā-thōr'lā, Spain, a town in the province of Jaen and 41 miles east of the city of Jaen. It rises in the form of an amphitheatre on the slope of the Sierra de Cazorla, and is well built, though much less important and populous than in the time of the Moors, during whose wars it held an important position. The Sierra de Cazorla is a wooded ridge round which winds the upper course of the Guadalquivir. Pop. about 6,000.

Cazot, Théodore Joseph Jacques, tā-ō-dōr zhō-zēf zhāk kā-zō, French politician: b. Alais 11 Feb. 1821. In 1848 he was active as a Republican in his home department; in 1870 he was appointed general secretary in the ministry of the interior; in 1871 elected to the National Assembly; and in 1875 was made life senator. From 1879-82 he was minister of justice and was interested in bringing about a reform in the appointment of judges, but retired without passing the law he desired. In 1883 he was president of the court of cassation, resigning in 1884 on account of being implicated in fraudulent dealings.

Cazotte, Jacques, zhāk kā zōt, French poet: b. Dijon 1720; d. 25 Sept. 1792. His masterpieces are: 'Oliver' (1762), a poem of chivalry after the manner of Ariosto; and 'The Devil in Love' (1772), a tale of wonder, still a popular favorite. He had extraordinary skill in versifying, as shown by his adding a seventh canto to Voltaire's 'Civil War of Geneva' with such perfect imitation of Voltaire's style and manner as to deceive all Paris.

Cazwini, kāz-wē'nē, Zacharia Ben Mohammed, Arabian naturalist: b. Cazwin, Persia, 1212; d. 7 Aug. 1283. He was descended from a family of lawyers, who derived their origin from Anas Ben Malek, a companion of Mohammed, and had settled in Cazwin, a city in Persia. From that place this author received the surname under which he has become celebrated. Of the circumstances of his life we know little more than that he was cadi of Wazith and Hillah, and died in the year of the Hegira 682 (1283 A.D.). His most important work is on natural history—'The Wonders of Nature and the Peculiarities of Creation'—of which Ideler, professor in the University of Berlin, published the chapter on the 'Constellations of the Arabians,' and of which there are fragments in Bochart's 'Hierozoikon,' in Ouseley's 'Oriental Collections,' and in Wahl's, Jahn's, and De Sacy's 'Arabic Chrestomathies.' It was the object of Cazwini, like Pliny, to describe the wonders of all nature. His work contains a comprehensive view of all that had been written before him, but in so grand and original a manner that it is of higher value than most of the original works which treat of the same subjects. There is an abridged translation of it in the Persian.

Cean-Bermudez, Juan Agustín, hoo-ān' ā-goos'tin thā-an' bēr-moo'dāth, Spanish archaeologist: b. Gijón, Asturias, 17 Sept. 1749, d. Madrid 3 Dec. 1829. He devoted himself early to the study of the fine arts, into which he was initiated by Raphael Mengs. After holding a public office at Madrid, he retired to Seville, where he founded an academy of fine arts, and occupied himself with the study of their history. He was elected a member of the royal academies of history and fine arts at Madrid, and published several valuable works connected with his favorite pursuits. His most important book, entitled 'Sumario de las antigüedades romanas que hayen España,' appeared posthumously in 1832.

Ceano'thus, a genus of shrubs and small trees of the natural order *Rhamnaceæ*. There are about 35 species, natives of the Pacific coast region of North America. They are characterized by serrate or entire simple leaves; small, perfect, white, purplish, or blue flowers in showy clusters, which are often panicked; and three-celled drupaceous fruits, which, on drying, separate into three stones. Many of the species and their hybrids are popular ornamental shrubs, especially in mild regions, their free-blooming habit rendering them specially useful as lawn specimens. Three species, *C. americanus*, *C. ovatus*, and *C. fendleri*, and some of their hybrids, are hardy in the north, but usually the hybrids must either be protected from frost or stored over winter in a plant-pit or frost-proof cellar. They succeed in almost any soil, but do best in light, well-drained loams,

especially when exposed to the sun. Propagation is easily effected by seeds, cuttings, or layers. *C. americanus*, known as New Jersey tea and red-root, is common from Canada to the Gulf States. Its leaves are said to be used as a substitute for tea, a use to which they are reported to have been put during the American Revolutionary war.

In medicine ceanothus has not been used to any great extent. Its roots contain from 6 to 10 per cent of tannin, and have been used in domestic medicine as astringents. Owing to the close resemblance of the roots, ceanothus has been used as an adulterant for rhatany.

Ceará, sã-ã-rã', Brazil, a state bounded on the north and east by the Atlantic Ocean and Rio Grande do Norte, on the south by Parahyba and Pernambuco, and on the west by Piahy. Its area is 40,250 square miles, and its population 881,686. The principal port and capital of the state is Fortaleza (q.v.), which is regarded as one of the most beautiful cities of Brazil. A railroad connects Fortaleza with Baturité. The principal exports of Ceará (statistics of 1899) are: rubber, cattle, cotton, hides, mules, preserved fruits, and hammocks. Coffee, sugar, wine of the cashew nut, oranges, and wax are also produced. The estimated value of all the exports is about \$5,000,000 annually, in which amount the United States shares to the extent of nearly one third. Ceará is divided into 27 comarcas, or counties. The most fertile and populous district is the upper Jaguaribe.

Ceará-mirim, a city in Brazil. Pop. 18,000.

Ceballos, José, hō-sã' thā-bal'yōs, Mexican soldier: b. Durango 15 March 1830. In 1869 he had command of a regiment in the province of Yucatan; while here a portion of his soldiers revolted, but he suppressed the insurrection in three days; he also executed without authority several private citizens who were implicated in the revolt. In 1870 he was made brigadier-general and given command in the western states, where he had charge of the campaign against the bandit chief, Losada. When Lerdo de Tejada became president of Mexico, Ceballos was put in command of the force sent to depose Camerana, the governor of Jalisco. After a severe struggle between the state and government forces, Ceballos was successful and became governor, a position which he held till 1876. At that time Tejada was deposed by Díaz; Ceballos joined with Iglesias, but was forced to leave Mexico for a time. He went first to California, then to Guatemala, where he was appointed director of a military school. Though at first plotting a revolution against Díaz he suddenly turned to his support, returned to Mexico, was restored to his rank, and made governor of the federal district. He has been a bitter enemy of the press, and in 1885-6 had a number of students and journalists arrested.

Ce'bes, of Thebes, Greek philosopher, a disciple and friend of Socrates, and the reputed author of the 'Pinax,' or 'votive tablet,' a philosophical dialogue representing allegorically the temptations of this life and teaching that true learning can alone make for happiness. In spite of its pure Attic, and its truly Socratic tendency, modern criticism now assigns the work to the 2d century A.D. It was extremely popular in

the Middle Ages, a sort of 'Pilgrim's Progress,' indeed; was translated into all the languages of Europe, as well as Arabic, which latter version, made possibly in the 9th century, is our sole record of the close of the dialogue. Modern editions are those of Drosihn (1871); Kraus, (1882); Parsons (1887).

Cebidæ, sěb'i-dē, a family of American monkeys, including the howler, saki, sapajou, spider-monkey (qq.v.), etc. See also **MONKEY**.

Cebu, thā-boo' or sě-boo', Philippines, an island lying between Negros and Bohol, north of Mindanao. Its length northeast and southwest is 139 miles; width, 24 miles; area, 1,668 square miles. It has a mountain system consisting of a chain running the length of the island, nearer the east than the west coast. The mountains are not over 2,200 feet high, but their ascent is steep and it is difficult to cross them. There are six passes, the best being the southernmost, from Sibonga to Dumanjug, over which United States army officers constructed a temporary wagon road in the summer of 1900. The chief products are rice, chocolate, sugar, and coffee. There are manufactures of hemp and piña cloth, sugar-sacks, cocoanut wine, sugar, salt, and cheese. In 1827 coal was discovered in Cebu, the first found in the Philippines. It is of good grade, adapted to general use. The trade of the island is extensive. Besides the mountain passes there are two main highways, one on the east coast, and one on the west coast, while the port of Cebu has communication with Manila and the islands of the Visayan group. Cebu was first occupied by United States troops in February 1899. Operations against the insurgents resulted in driving them from their position, and capturing a large quantity of material of war. This island, with a few dependent islands, forms the province of Cebu, in which civil government was created under the provincial government act of 1901. At that time several of the cities had organized their municipal governments according to the code of the Philippine commission. Though the province was restored to military government for a time in 1901, civil government was permanently resumed in January 1902. Pop. (province) 518,000.

Cebu, Philippines, capital of Cebu province, situated on the east coast of the island of Cebu. The streets are wide and regularly laid out. There is a cathedral in one of the suburbs, and it has also several other churches and an Episcopal palace. Cebu is an important port with an extensive trade. It is the oldest Spanish settlement in the Philippines. In the "Rizal," a building in front of the Santo Nino Church, is the cross which it is said was planted near the town by Magellan when he took possession of the island. An old fort built by the Spaniards stands within the limits of the town. Pop. 35,243.

Cecchi, Giammaria, jām-mā-rē'ā chěk'kē, Italian dramatist: b. Florence 14 April 1518; d. there 28 Oct. 1587. He was the rival of Bibbiena, Machiavelli, and Ariosto in portraiture of character and in liveliness of dialogue. Of his plays, 95 in number, but few have been printed. These are mainly imitations of Plautus and Terence; the best of them are: 'The Hammer'; 'The Slave'; and, the most famous

of all, 'The Owl.' He wrote also religious dramas; among them 'The Exaltation of the Holy Cross' (1580).

Cecco d'Ascoli, chěk'kō dās'kō-lē, properly Francesco Stabili, Italian poet: b. Ascoli about 1257; d. Florence 16 Sept. 1327. He was a devoted student of astrology and of demonology. For the expression and defense of certain erroneous opinions he was burned at the stake. His heretical or impious doctrines are contained in a poem, unfinished but of encyclopædic compass, 'Bitternesses,' of which he lived to complete four books. The subject of the first book was astronomy with meteorology; of the second, stellar influence with physiognomy; of the third, minerals; of the fourth, sundry problems, moral and physical.

Cech, chěk, **Sva'topluk**, Czech writer: b. Ostredek 21 Feb. 1846. He was editor in succession of several journals, and at the same time practised law. After winning some celebrity as a writer of stories and short poems, he made a bolder flight in 1872 with 'Dreams,' in which he shows great epic power. Besides this he has written several other poems, as 'The Adamites'; 'The Storm'; 'Songs of Morning.' He is the most popular of Czech poets. As a novelist he excels in lively wit and rich humor. Among his works of prose fiction may be named: 'Stories, Arabesques, and Humoresques'; and the amusing 'Candidate for Immortality.' He has written also 'Memories from the Orient' (1885), as well as later volumes.

Cecidomyia, sēs-i-dō-mī'ya, a genus of two-winged flies, of the family *Cecidomyiidae*, the gall-gnats (q.v.).

Cecil, sēs'il or sīs'il, **Evelyn**, English writer: b. 1865. He was educated at Eton and New College, Oxford, studied law and became a barrister of the Inner Temple. He was a private secretary to the Marquis of Salisbury, 1895-1902, and sat in the House of Commons as member for East Herts, 1898-1900. He was the last Englishman who conferred with Presidents Kruger and Stein prior to the beginning of the Transvaal war in 1899. He has published 'Primogeniture: a Short History of its Development in Various Countries and Its Practical Effects' (1895); 'On the Eve of the War' (1900).

Cecil, **Robert**, Earl of Salisbury, English statesman, second son of William Cecil, Lord Burleigh (q.v.): b. about 1563; d. Marlborough, Wiltshire, 24 May 1612. Having received the honor of knighthood he went to France as assistant to the English ambassador. On the death of Sir Francis Walsingham he succeeded him as principal secretary, and continued to be a confidential minister of Queen Elizabeth to the end of her reign. Having secretly supported the interests of James I. previous to his accession to the crown he was continued in office under the new sovereign and raised to the peerage. In 1603 he was created a baron, in 1604 Viscount Cranbourn, and in 1605 Earl of Salisbury. In 1608 he was made lord high treasurer, an office which he held till his death.

Cecil, **William**, **LORD BURLEIGH**. See **BURLEIGH**.

Cecil Dreeme, a novel by Theodore Winthrop, published in 1862. By its brilliancy of style, crisp dialogue, sharp characterization, and ingenuity of structure, it won an immediate popularity.

Cecil'ia, Saint, Christian virgin and martyr; her day in the Roman calendar is 22 November. Her story as recounted in the 'Breviarium Romanum,' represents her as a Roman lady of noble birth, a Christian from childhood, and from her early years vowed to virginity. Yet her parents gave her in marriage to a young noble, Valerianus, whom Cecilia persuaded not only to respect her vow, but also to become a Christian; and he, converted, induced also his brother, Tiburtius, and their intimate friend, Maximus, to enter Christ's fold; shortly after these three suffered martyrdom together. Cecilia now, in anticipation of the same fate or the same crown, distributed her possessions among the poor, and this becoming known to the prefect of Rome he ordered her to be taken to his own mansion and there burned to death in the bath (*in balneo*). But the virgin, exposed to the flames for a day and a night, was found unhurt; and after the axe of the headsmen had also failed to sever her head from her body, at last she won the double wreath of virginity and martyrdom; this was in the reign of Alexander Severus and in the pontificate of Urban I., about the year 230. Urban erected a church in her house which was called by her name. The Church of St. Cecilia is still one of the most notable churches of Rome, having been again and again repaired or reconstructed. In this account of Saint Cecilia nothing is said of the musical accomplishments of the virgin, but legend makes much of them; hence, Saint Cecilia is the patron saint of music and musicians, and musical societies are very commonly called by her name: Dryden's fine ode, 'Alexander's Feast: a Song for Saint Cecilia's Day,' is an imperishable monument of the Cecilian legend in English literature.

Cecilia, a novel by Frances Burney, published in 1782. It is a typical English novel of a century ago. The plot is simple, the story long drawn out, the style stilted, and the characters alone constitute the interest of the book, and justify Dr. Johnson's praise of Miss Burney as "a little character-monger."

Cecomorphæ, sê-kô-môr'fê, one of Huxley's groups of schizognathous birds, now generally ranked as a sub-order or order, or split up in various ways among several orders. The palate has a narrow cleft on each side of the vomer, running the entire length between this bone and the palatines; the nostrils are usually narrow slits, but are sometimes tubular; the feet are always webbed, with three toes directed forward and the hallux small or wanting, and never connected to the other toes by a web. The *Cecomorphæ* are all aquatic birds, and may be subdivided into the *Pygopodes* or divers, and the *Longipennæ* or long-winged swimmers. The former includes the following important families: *Alcidæ*, the auks, puffins, and guillemots (qq.v.); *Podicipedidæ* (q.v.), the grebes; *Heliornithidæ*, the sun-birds (q.v.); and *Colymbidæ*, the divers (q.v.). The *Longipennæ* group includes two families, the *Procellariidæ* or petrels, albatrosses, and shearwaters (qq.v.); and the *Laridæ*, or gulls, terns, and skimmers (qq.v.).

Cecro'pia, a genus of plants of the order *Artocarpacæ*, of which the best known species is the trumpet-tree (*C. peltata*) of the West Indies and tropical South America. It attains a height of about 50 feet, and has a hollow stem and branches, from which musical instruments are made. Its leaves are very large, circular, and peltate, and serve as food for sloths; and its flowers are small and grouped in short spikes, several of which are enclosed at first in a large bract. The wood is light and soft, and is employed by the natives in various ways, particularly for the purpose of obtaining fire by friction. Ropes are made from the inner bark, and the outer bark has astringent properties. Caoutchouc is obtained from the juice, and the buds are employed as a pot-herb. Ants utilize the hollow stems as dwellings.

Cecropia Moth, a colossal species (*Samia cecropia*) of the family *Saturniidae*. The moth expands five or six inches and is brick-red in color, the wings tinged with grizzly, each wing with a large crescent-shaped spot near the centre, which is red and white, or white-edged with red and black; on the apex of each fore wing is a large, black, eye-like spot. The caterpillar is a large green worm three to four inches in length, protected by large tubercles colored green, blue, yellow, or red. It is not uncommon on the elder, willow, apple, currant, pear, thorn, poplar, etc. At the end of summer it spins a large cocoon, open at one end,—not oval, as in those of *Telega polyphemus* and the luna moth,—and attaches it to a branch of a tree. An allied species in northern Maine and Canada is *S. columbia*, while in the Rocky Mountain region, Colorado and Wyoming it is represented by *S. gloveri*, and on the Pacific coast by *S. californica*. The silk of this species cannot be used because its fibres are not continuous.

Cecrops, sê'krôps, according to Greek tradition, the founder of Athens, and the first king of Attica. He was said to have been an autochthon (sprung from the soil), and was sometimes represented as half man, half dragon. He taught the savage inhabitants religion and morals, made them acquainted with the advantages of social life, and laid the foundation of the future city of Athens, which after him was originally called Cecropia. He is also said to have introduced the art of ship-building. He died after a reign of 50 years. By the later Greeks he was represented as having led a colony to Attica from Sais in Egypt about 1400 or 1500 B.C., but the best modern critics do not look upon this event, nor on the life of Cecrops at all as historical. There is no doubt that Egypt did have a certain influence on the development of civilization in Greece, but how great this influence was, or in what manner exercised, history does not furnish sufficient data to enable us to decide. It is probable that the true Cecrops was a hero of the Pelasgian race.

Cedar, various cone-bearing evergreen trees and their wood; also several non-coniferous trees. The most widely known are probably the cedar of Lebanon (*Cedrus libani*), the deodar, or goa-tree, of India (*C. deodara*), and the African or Mount Atlas cedar (*C. atlantica*). These three species are regarded by some botanists as mere varieties of the first-named species. They are large ornamental evergreen trees with wide spreading branches which give

CEDAR — CEDAR CREEK

them a form distinct from most other cone-bearing trees. They are sometimes planted in southern California and the Gulf States, and the last-mentioned species even as far north as Philadelphia, where it can stand the winter in sheltered situations. They are readily propagated by seeds, and thrive well in well-drained loamy soil. From ancient times their odorous, light-red wood has been used for fine furniture and interior house-finish. The white gum of the cedar of Lebanon, which oozes from the trunk and branches, was formerly employed in embalming, but the forests of this tree have become so much reduced that neither the resin nor the oil made from it are in commerce. The other species are most abundant, the deodar in India and the Atlas cedar in northern Africa. Their timber is widely used for fine cabinet work.

The red cedar (*Juniperus virginiana*) is a well-known very variable tree found from Canada to Florida, and westward to the eastern slope of the Rocky Mountains. It attains a height of about 100 feet; has a conical more or less spreading head with upright limbs; evergreen, spiny, pointed leaves, and brownish or bluish globular fruits covered with bloom. The wood is largely used for fence-posts. The white cedar (*Thuja occidentalis*) is also a well-known American tree found in wet ground from Maine to Florida, and westward to the Mississippi River. It attains a height of 70 to 80 feet; has erect spreading branches; thin and slender pendulous twigs; fragrant, glaucous, green leaves; and tiny bluish-purple cones covered with bloom. The trees are highly ornamental, and, being hardy, are general favorites in the north. The wood is especially useful in moist places. The name white cedar is often applied to the *Arbor vita*. The yellow cedar (*Cupressus nootkatensis*), a common tree on the Pacific coast from California to Alaska, is valued, in cabinet work and interior house-finishing, for its light-yellow wood, which takes a high polish. Like its relative mentioned above, it is often planted for ornament. In its home it often exceeds 100 feet in height. The best known non-coniferous trees that are sometimes called cedar are probably *Cedrela odorata* (see CEDAR, BARBADOES) and *Cedrela toona*, the Australian cedar. See TOONA; JUNIPER.

Cedar, Barbadoes, a tall tree (*Cedrela odorata*) of the natural order *Meliaceæ*. It is a native of the West Indies, where its wood is highly valued for making certain kinds of furniture, cigar-boxes, canoes, and shingles. It is also exported for the manufacture of lead pencils. It often attains a height exceeding 75 feet and a great girth. It bears pinnate leaves 10 to 20 inches long; pendulous terminal panicles of inconspicuous whitish flowers, followed by dehiscent fruits about half an inch in diameter, containing numerous flat-winged seeds. The bark, leaves, and fruits smell like assafœtida, but the wood is pleasantly fragrant. The tree is often planted for its ornamental qualities, especially along avenues. It thrives in southern California and in the Gulf States. Several of its relatives, especially *C. sinensis*, which is hardy as far north as Philadelphia, are also similarly used. See TOONA.

Cedar-apples, fungus outgrowths upon juniper and red cedar trees. They are caused by

the parasitic fungus *Gymnosporangium macrospus*. At first they appear like warts upon the smaller branches and twigs, becoming chocolate color or brown as autumn advances, and remaining attached and unchanged until spring, when they enlarge into horn-shaped, jelly-like masses that resemble sponge. At this time they produce their abundant spores which, as the masses become dry, are blown away by the wind and, alighting on apple-trees, produce rust on the foliage and other green parts. They will not germinate upon cedar or juniper, but require an alternate host, the apple, to complete their life cycle. For methods of control see APPLE (*Diseases*); FUNGICIDE.

Cedar-bird, the common American wax-wing (*Ampelis cedrorum*), a bird found throughout North America, breeding from the latitude of Kentucky northward. In most localities it is only partially migratory. It is a beautiful bird of delicate unobtrusive colors, generally ashy-brown with a purple tint on the head, the front of which, like the throat, is black. The tail-feathers are tipped with yellow, and the wings are crossed by a white bar, below which are the peculiar red sealing-wax-like appendages. The head is gracefully crested. The cedar-birds spend most of the time in flocks, which wander according to the supply of food and are noteworthy for the uniformity with which all members alight or rise together. The food consists chiefly of berries when these are to be had, on which account they have received the name of cherry-birds in some sections. Nesting takes place late, when the summer is well advanced, and the rather bulky structure is usually placed in an apple or other orchard tree. The eggs are four to six in number, pale blue, and thickly speckled.

Cedar Creek, a stream in Shenandoah County, Virginia, flowing into the North Fork of the Shenandoah River.

Cedar Creek, Battle of. After the battle of Fisher's Hill, 22 Sept. 1864, Gen. Sheridan followed Early as far as Harrisonburg, his cavalry going as far as Port Republic, Staunton, and Waynesboro. In view of the difficulty of supplying his army so far from its base, and of other operations by which two corps of infantry and a cavalry division of his army were to be sent to the Army of the Potomac, he holding only the lower valley of the Shenandoah, Sheridan, after ordering the destruction of all mills, barns, grain, forage, and provisions of all kinds, began to withdraw down the valley on 5 October, and on the 8th recrossed Tom's Brook. His rear had been so persistently followed and harassed by the Confederate cavalry divisions of Rosser and Lomax that he ordered Torbert, his cavalry commander, to whip the Confederate cavalry or get whipped. On the morning of the 9th Torbert fell upon Rosser and Lomax, and in a two-hours' contest routed them, pursuing many miles and capturing over 300 prisoners, 11 guns, and 40 wagons. Sheridan then resumed his march, and on the 10th halted on the north bank of Cedar Creek. Wright's Sixth Corps continued its march to Front Royal, on the way to Washington, where it remained two days, and then marched toward Ashby's Gap, but was recalled to Cedar Creek, where it arrived on the 14th. Early had been reinforced by Kershaw's division and about 600 cavalry,

CEDAR CREEK

increasing his force to about 18,000 men, and under Lee's order to detain the Union troops in the valley he had followed Sheridan, arriving at Fisher's Hill, six miles from Cedar Creek, on the 13th. On the night of the 15th Sheridan left for Washington to consult with Stanton and Halleck, leaving Gen. H. G. Wright in command of the army. Sheridan's cavalry accompanied him to Front Royal, from which point he intended to push it through Chester Gap to the Virginia Central R.R. at Charlottesville and raid the country east of the Blue Ridge, but upon erroneous information that Longstreet was moving to join Early, the raid was abandoned and Torbert moved the cavalry back to Cedar Creek. On the night of the 18th Emory's Nineteenth corps was on the west side of the valley turnpike, on elevated ground overlooking Cedar Creek. Wright's Sixth corps in reserve to the right and rear of the Nineteenth, separated from it by Meadow Brook. Merritt's cavalry division was on the right of the infantry, and Custer's division $1\frac{1}{2}$ miles beyond Merritt's, watching the crossings of Cedar Creek and the roads on the right. Crooks' Eighth corps was on the east side of the pike, one of its two divisions (Thoburn's) on a rounded, entrenched hill, one fourth of a mile in advance of the other, near the junction of the creek and river, and both somewhat in advance of the Nineteenth corps on the right. Two cavalry brigades of Powell's division were far to the left, near Front Royal, and one at Buckton Station, two miles beyond Crooks' left. The Union army numbered about 31,000 men. Reconnoissances were sent out daily from the flanks to see what Early was doing, and that of the Eighteenth reported that the indications were that he had retreated from Fisher's Hill. He had not retreated, but had matured a plan of attack. A reconnoissance by Gen. Gordon had disclosed the fact that the left of the Union line was lightly picketed, with but a small cavalry force on the North Fork of the Shenandoah, and that it was practicable to move infantry secretly by night across the creek, which was easily fordable, and through the woods to within less than half a mile of Crooks' left and rear. This plan Early adopted, assigning for the movement the divisions of Gordon, Ramseur, and Pegram, and Payne's cavalry brigade, all under command of Gordon. Early, with the divisions of Kershaw and Wharton and all his artillery, was to co-operate in the effort to crush the Union left and centre. Two brigades of cavalry were to demonstrate on the Union right, and Lomax's cavalry, moving by Front Royal, was to strike the valley pike in the Union rear. The movement began after dark of the 18th. Gordon led his column across the North Fork of the Shenandoah, down its right bank, and again crossing below the mouth of Cedar Creek, reached his assigned position before daylight. Early led Kershaw across Cedar Creek, midway between its mouth and the pike, and at the first flush of dawn, covered by darkness and fog, captured or drove in the picket line and rushed over the intrenchments held by Thoburn's division, at a point where they were not manned, surprised the camp, soon swept everything out of it, and captured seven guns, which were turned upon the fugitives. Kershaw then advanced on R. B. Hayes' division and Kitching's brigade, and at the same time Gordon

charged out of the woods directly upon Hayes' left and rear, the combined attacks breaking his division and Kitching's brigade, and uncovering the left of the Nineteenth corps, which was now assailed by Kershaw and Gordon, while at the same time Wharton's division, moving swiftly down the pike, followed by 40 pieces of artillery, attacked in front, and the greater part of the Nineteenth corps, abandoning 11 guns, was swept from the field. Wright, who had foreseen at the beginning of the attack that his position was untenable, and a change of front necessary, now ordered the Sixth corps, under Gen. Ricketts, who was moving with two divisions to support the left, to fall back to some tenable position, and the Nineteenth corps was ordered to rally on the right of the Sixth. The Confederates followed up their advantage, taking many prisoners, but were checked by the Sixth corps, Wharton being badly repulsed. Early still pressed matters; it was now 9 o'clock, and Wright, losing six guns of his own corps, withdrew to a more favorable position one and a half miles north and west of Middletown, where he was joined by the cavalry brigade from Buckton and by Torbert, with the two cavalry divisions that had been ordered from the right to left of the infantry line; while the division commanders of the Sixth and Nineteenth corps were told the enemy would be attacked about 12, noon, as soon as an ample resupply of ammunition could be issued. Meanwhile Sheridan, who had arrived at Winchester on the afternoon of the 18th, was hastening to the front, meeting on the way a stream of fugitives, whom he ordered to turn back, as he intended to reoccupy the old camp that night. He arrived on the field a little after eleven o'clock, during a lull in the fight, after Wright had reunited the divisions of the Sixth corps, which had been fighting by themselves during the morning, and after the Nineteenth corps had been rallied and placed in line, also parts of the Eighth corps, the only part of the army seriously engaged being a division of the Sixth corps and the cavalry, tenaciously holding the valley pike, the key-point of the battle. Wright's disposition of the infantry was approved, and the only change made in the line was to send Custer's cavalry back to the right of the infantry. About one o'clock Early pushed forward his entire line, but was quickly repulsed, and then busied himself in collecting his stragglers, who were plundering the captured camps, getting his prisoners and captured guns and wagons back to Fisher's Hill, and throwing up a defensive line beyond the reach of the Union artillery. At four o'clock Sheridan saw a movement of Early's, which he thought indicated an attack, and ordered a general advance, the Nineteenth corps on the right, the Sixth on the left, with the Eighth following in reserve, Custer's cavalry on the right, and Merritt's on the left of the infantry. The movement developed into a left half-wheel, and after a very severe and obstinate fight, during which parts of the Union line were repulsed, again to go forward, was successful; the Confederate line was broken near its left, other parts of the line gave way, and soon the entire army fled in panic and disorder from the field and across Cedar Creek, Sheridan's infantry following as far as the creek, the cavalry continuing the pursuit three miles beyond and until after dark, capturing guns, wagons, ambulances,

CEDAR FALLS—CEDAR MOUNTAIN

and prisoners. Early, with but few of his men, rested at night in his intrenchments at Fisher's Hill, and at 3 o'clock next morning retreated to New Market, followed by Sheridan's cavalry as far as Woodstock. The 24 guns captured by Early were retaken, and he left in Sheridan's hands 23 of his own. The Union loss was 644 killed, 3,430 wounded, and 1,591 missing; of the latter 1,429 were sent as prisoners to Richmond. The Confederate loss was 320 killed, 1,540 wounded, and 1,050 missing. Early's offensive movement suspended for a time the transfer of any part of Sheridan's army to the Army of the Potomac; his defeat ended efforts on the part of the Confederates to invade the North by way of the Shenandoah valley. Consult: 'Official Records,' Vol. XLIII.; Pond, 'Shenandoah Valley in 1864'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.; Sheridan, 'Personal Memoirs'; Keifer, 'Slavery and Four Years of War,' Vol. II.

E. A. CARMAN.

Cedar Falls, Iowa, a city in Black Hawk County, situated on Cedar River and on the Burlington, C. R. & N., the Illinois Central, and the Chicago & G. W. R.R.'s, 85 miles northeast of Des Moines. It is actively engaged in manufacturing, having a foundry, a pump factory, and mills turning out flour, oatmeal, paper, etc. A State normal school is located here. Pop. (1900) 5,319.

Cedar Keys, Fla., a seaport in Levy County, on the Gulf of Mexico, 118 miles southeast of Tallahassee. It takes its name from the keys surrounding the harbor. There is a lighthouse on one of the keys. The town has a large trade in pine, cedar (largely used for pencils), sponges, and fish. Pop. (1900) 739.

Cedar Lake, a lake of Canada, in the Saskatchewan district, a sort of expansion of the river Saskatchewan, receiving the waters of this large stream to pour them over the Grand Rapids into Lake Winnipeg. Between Grand Rapids and Cedar Lake is another expansion, known as Cross Lake. Cedar Lake is nearly 30 miles long, and where widest 25 broad; area about 312 square miles. Its depth of water is sufficient for the largest craft, except on the northwest, where the quantity of alluvium brought down by the Saskatchewan is rapidly filling it up. Both the mainland and the islands are well wooded with balsam spruce, birch, poplar, tamarack, Banksian pine, and cedar, the last growing on the shores of the lake, particularly the northwest, and giving it its name.

Cedar Mountain, Cedar Run, or Slaughter's Mountain, Battle of. On 8 Aug. 1862, Crawford's brigade of Bank's corps marched from Culpeper Court-house, eight miles to Cedar Run, to support Bayard's cavalry brigade, which was being driven back by Stonewall Jackson, who, with the three divisions of C. S. Winder, Ewell, and A. P. Hill, in all nearly 24,000 men, was advancing from Gordonsville to seize Culpeper. On the 9th Bank's entire corps, at Little Washington, was ordered to follow Crawford, and Sigel was ordered to march his corps from Sperryville to the same point. Banks joined Crawford at Cedar Run about noon and took position on elevated ground just beyond it, covering the road to Culpeper, Crawford's brigade and six companies of the 3d Wisconsin,

of Gordon's, on the right of the road, partially concealed in woods. Gordon's brigade was held in reserve on the hither side of the stream. Across the road on Crawford's left was Geary's brigade; Prince's brigade was on Geary's left, and Greene's small brigade to the left of Prince and somewhat refused. Seven batteries of artillery were distributed on the plateau slightly in advance of the infantry. Banks had about 8,000 men. Jackson crossed the Rapidan on the 8th, and about noon of the 9th drove back Bayard's cavalry, and following, came under fire of the Union artillery and prepared for battle. Early's brigade was ordered to advance, keeping to the right and close to the Culpeper road, while Ewell led his two other brigades farther to the right along the slope of Cedar Mountain. Early advanced until he came under severe artillery fire, when he halted under cover of a small hill, and C. S. Winder's division and three batteries came up on his left, Campbell's brigade on the extreme left, then Taliaferro's, with Winder's brigade in reserve. While placing his batteries on and near the road Winder was mortally wounded by a piece of shell. It was now five o'clock, and Banks gave the order to advance and attack. The three brigades of Crawford, Geary, and Prince threw out skirmishers, drove in those of the Confederates, and the main line advancing became severely engaged. Early's right held its own against Prince, but on the Union right Crawford, advancing with great impetuosity, attacked and routed Campbell's brigade; then swung to the left, fell upon and (with the assistance of Geary) routed Taliaferro and shook Early's left. It was going hard with Early when Hill's division came up and, forming on his right and left, restored the fight, checked Crawford's further success, drove him and Geary back, and held Prince in check. Then the 10th Maine, of Crawford's brigade, which had been held in reserve, went forward on the extreme right, and in less than 10 minutes was compelled to retreat with a loss of nearly one half its men. At the same time a battalion of Pennsylvania cavalry charged down the road and was instantly driven back in disorder. Gordon's brigade came on the field as the 10th Maine was going out. In its advance it moved a little to the right of where the 10th Maine had been, and was met by the brigades of Branch, Archer, and Winder, with such a withering front and flank fire that it was badly cut up and parts of it driven, again to rally and go forward, but, under cover of the woods, Pender's brigade gained its right and rear, poured in a volley and drove it from the field. The artillery had now been withdrawn and the Confederates advanced. Prince's brigade fell back, leaving Prince and many of the men prisoners, and Greene, on the extreme left, who had not been seriously engaged, but had held Ewell's two brigades in check, was withdrawn. Night had now fallen, but Jackson, desiring to enter Culpeper before morning, gave immediate pursuit, and when 1½ miles from the field was checked by Banks' rallied troops and Rickett's division, which had come up from near Culpeper, followed later by Sigel. Gen. Pope also had arrived and assumed command. The Union loss was 1,759 killed and wounded and 594 missing. The Confederate loss was 1,338 killed and wounded and 31 missing. Pope and Jackson confronted each other on the 10th

CEDAR MOUNTAINS — CEHEGIN

and 11th, but on the night of the 11th Jackson retreated, abandoning many of his wounded, recrossed the Rapidan, and marched to the vicinity of Gordonsville. Consult: 'Official Records,' Vol. XII.; Ropes, 'The Army Under Pope'; Gordon, 'Army of Virginia'; Allan, 'Army of Northern Virginia in 1862'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. II.

E. A. CARMAN.

Cedar Mountains, a mountain range in Cape Colony, extending nearly along the meridian of 19° E., for about 25 miles southward, beginning with lat. 32° S., and rising at some places to the height of 5,000 feet. Fine cedar-trees of gigantic size formerly covered these mountains, and still do so to a considerable extent. These mountains contain many Bosjesman caves.

Cedar Oil, an aromatic oil obtained from the American red cedar (*Juniperus virginiana*). It is used for scenting soaps.

Cedar Rapids, Iowa, city in Linn County, on the Cedar River, and on the Burlington, C. R. & N., the Chicago & N. W., the Chicago, M. & St. P., and the Illinois Central R.R.'s, 79 miles southwest of Dubuque. The city is regularly laid out and well built, and is the trade centre of the surrounding country. It contains large pork-packing establishments, and the river supplies power for numerous manufactories, including machine-shops and foundries, woolen-mills, breweries, carriage factories, extensive works for making agricultural implements, etc. It has waterworks, a high school, daily and weekly newspapers, public and Masonic libraries, and national banks. It is the seat of Coe College. The city is connected with the opposite bank of the river by a handsome bridge. Pop. (1900) 26,656.

Cedar, or Red Cedar, River, a river rising in the southern part of Minnesota and flowing southeast through the eastern part of Iowa to Muscatine County, where it turns southwest and empties into the Iowa River, after a course of about 350 miles.

Ce'dartown, Ga., a city and county-seat of Polk County, on the Central of Georgia and the East & W. R.R.'s, 108 miles northwest of Columbus. It is located in a fruit-growing and iron-mining region, and has foundries, machine-shops, etc. A trade in lumber is also carried on. Pop. (1900) 2,823.

Cedilla, se-dil'la, a mark used under the letter c in French and Portuguese when the c stands before a, o, or u, to indicate that it is to be pronounced like the English s, not like k, as is usual before these letters. A c with the cedilla under it is written ç.

Cedrela, sêd-rê-là, a genus of large timber trees, natives of the tropics of both hemispheres, giving name to the order *Cedrelaceæ*, which is now usually included in *Meliaceæ*. The species have evergreen, equally pinnate leaves, and small bell-shaped white flowers. *C. odorata* of Honduras and the West Indies yields bastard cedar. *C. australis* is a valuable Australian timber tree. *C. toona*, a native of Bengal, furnishes timber much like mahogany. The bark is very astringent, and has been found valuable in fevers, dysentery, etc. The flowers are used for producing a red dye. The bark of *C. febrifuga* is used against the intermittent fevers of Java.

Cedrelaceæ, sêd-rê-lâ-sê-ê, the mahogany family, a natural order of dicotyledonous plants, nearly allied to, if really separate from, the *Meliaceæ*. They are trees with alternate pinnate leaves and a woody capsular fruit. Different species yield mahogany, satin-wood, yellow-wood, etc. The typical genus is *Cedrela* (q.v.).

Cedric, a steamship of the White Star Line, a type of modern steamship construction. She was built by Messrs. Harland & Wolff, at Belfast, Ireland, and is constructed of steel. Her length is 700 feet; greatest breadth, 75 feet; and depth, 49 feet 4 inches. Her gross tonnage is 21,000, and her displacement tonnage 38,200. Her launching weight was 14,257 tons, and her dead-weight carrying-capacity 18,400 tons. She has nine decks and is built on the cellular double-bottom principle, with many water-tight compartments designed to render her practically unsinkable.

The Cedric is propelled by twin screws, driven by two sets of quadruple engines, to operate which eight double-end boilers are employed, each capable of working up to a pressure of 210 pounds to the square inch. The oval funnels which carry off the smoke and waste gases from her furnaces are 14 feet 3 inches by 11 feet in diameter, and the height from their top to the keel is 131 feet. While the vessel is not built for speed, she is yet capable of developing 17 knots an hour, a rate which enables her to cover the passage between New York and Liverpool in from seven to eight days.

Passenger accommodations are provided for 350 in the first saloon, 250 in the second saloon, and 2,000 in the steerage. With 335 in the crew, her total population, with all berths filled, will amount to 2,935. The saloon dining-room is situated on the upper deck and covers the extreme width of the vessel. The state-rooms include suites of bed-, sitting- and bath-rooms, and in the steerage there are to be found, besides the usual open berths, cabins with two, four, or six berths. The third-class passengers have the use of dining-, sitting- and smoking-rooms, and all parts of the ship are ventilated by electric- and steam-driven fans. Some idea of the ship's massive construction may be gained from the fact that some of her plates weigh as much as three tons, while her great stern frame contains over 50 tons of metal.

Cefalù, chā-fa-loo' (ancient CEPHALÆDIS), Italy, a seaport and episcopal city of northern Sicily, 39 miles east-southeast of Palermo. It is surrounded by an old wall and has a very picturesque site at the foot of a precipitous rock. The trade is not large, but an active fishery is carried on. Sardines are caught in abundance.

Chegin, thā-ā-hēn', Spain, a town in the province of Murcia and 39 miles west-northwest of the city of Murcia, four miles east of Caravaca, on a declivity facing the south. It has numerous spacious streets, and two squares, lined with substantial houses and neat public buildings, comprising a parish church, three chapels, town- and court-houses, a prison, hospital, theatre, cemetery, and several schools. The manufactures include paper, cloth, soap, pottery, brandy, wine, and oil. There is also trade in grain, wool, hemp, silk, wax, cotton,

CEILING — CELEBES

etc. In the neighborhood various quarries of jasper and variegated marble are wrought. Pop. 12,000.

Ceiling, the upper surface of a room. The word seems to have been suggested by the use of arched coverings for churches, and even for rooms, which prevailed in the Middle Ages, and was not unknown to the Romans. Arched ceilings among the Romans were known by the name *cameræ* or *camera*, the Greek origin of which seems to furnish an argument in favor of the view that the arch was known to the latter people. The camera was formed by semi-circular beams of wood, at small distances from each other, over which was placed a coating of lath and plaster. In later times the *cameræ* were frequently lined with plates of glass, when they were termed *vitreæ*. But the ceilings most common among the Romans were flat, the beams, as in modern times, having been at first visible, and afterward covered with planks and plaster. Sometimes hollow spaces or panels were left between the planks, which were frequently covered with gold and ivory, or paintings. The arched ceilings of the Romans were commonly of brick or concrete covered with stucco, and were of three kinds: barrel vaults, groined vaults, and domes. The favorite ceiling in the East was the dome, that in the West during the Middle Ages, was the groined and ribbed vault. Modern ceilings are generally flat and are of plaster or wood. When the ceiling is divided into deep panels it is said to be coffered. See VAULTING.

Celakowsky, chā-la-kōv'skē, Fran'tisek Lad'islaw, Bohemian poet and philologist: b. Strakonitz 7 March 1799; d. Prague 5 Aug. 1852. He was destined for the pulpit, but from patriotic impulses declined to adopt that profession, and engaged in 1821 as instructor in a nobleman's family. In 1828 he became associate editor of the 'Quarterly Review for the Catholic Clergy,' published by the consistorium at Prague, and in 1834 editor of the 'Bohemian Gazette,' and of the 'Bee,' a literary journal. He also commenced a series of lectures on the Cechic language and literature, at the university of Prague. He lost both his situation as editor and that at the university, in consequence of a remark against the Emperor Nicholas. The Bohemian society for the propagation of science elected him a member in 1840. In 1842 he accepted a professorship of the Slavic language and literature, recently established by the king of Prussia for the benefit of his Polish subjects, at the university of Breslau. After the events of 1848, the Austrian government, which now sought for support from the Cechic nationality, offered him a professorship at the university of Prague. Of his numerous works, the following are most remarkable: 'Poems' (1822); 'Slavic National Songs' (1822-7); 'Lithuanian National Songs' (1827); a metrical translation of Walter Scott's 'Lady of the Lake' (1828); a translation of Augustine's 'De Civitate Dei' (1829-32); 'Echo of Russian National Songs' (1829); 'Echo of Cechic National Songs' (1840). One of his latest works was the 'Popular Philosophy of the Slavic Nations in their Proverbs' (Prague 1851). After 1835 Celakowsky was engaged in a comparative study of all the Slavic dialects, the fruit of which is given in part in his additions to Jungmann's

Cechic dictionary. As a poet he is distinguished by the grace and *naïveté* of his popular songs.

Celandine, sēl'an-dīn (*Chelidonium*), a genus of herbs of the natural order *Papaveraceæ*. The few species are natives of Europe, where they are widely distributed, and whence they have spread to other parts of the world. It is common in some of the older parts of the United States, having escaped from gardens. Common celandine (*C. majus*), which is most frequently seen, is an ill-smelling biennial or perennial plant with brittle hairy stems, pinnate leaves, small yellow flowers in small umbels, and slender two-valved pods. The plant has long been popular in old-fashioned gardens. It is easily grown from seed and produces abundant flowers all through summer. All parts contain an acrid yellow juice, for which the plant has been sometimes used in medicine, though it is now used practically only by the Eclectics. It is a drastic purgative, but its action is very irregular and difficult to control, and hence it has not been introduced into regular medicine because of its many inequalities.

Celano, Tommaso da, tōm-mā'sō dā chā-lā'nō, one of the reputed authors of the Latin hymn 'Dies Iræ': b. Celano, in the Abruzzi, toward the end of the 12th or about the beginning of the 13th century; d. Italy after 1250. He was one of the most devoted adherents of St. Francis of Assisi, and after the establishment of an order of Minorite friars on the Rhine was appointed keeper (*custos*) of the Rhine districts. In 1230 he returned to Italy. He wrote a life of St. Francis, and several hymns. His claim to the authorship of the 'Dies Iræ' seems now fairly well established, but is still disputed in favor of Matthäus Aquasparta (d. 1303), Cardinal Frangipani (d. 1294), and even St. Bernard, Gregory the Great, and others. His name is first mentioned in connection with the poem toward the close of the 14th century.

Celastraceæ, sēl-ās-trā'sē-ē, an order of polypetalous dicotyledons, consisting of shrubs and small trees, natives of southern Europe, Asia, America, Australia, etc., most of them of no great importance. They have generally acrid properties. The chief genera are *Celastrus*, *Euonymus*, and *Elæodendron*.

Celaya, sâ lā'yā, Mexico, a town in the state of Guanajuato, on the Rio Laja, about 150 miles northwest of the city of Mexico. It has several fine plazas, handsome churches, among which is that of Our Lady of Carmen, a magnificent structure, and manufactures of cotton and woolen cloths, saddlery, and other articles. The burning of its bull-ring, on Easter Sunday, 1888, caused considerable loss of life. Pop. 22,000.

Celebes, sēl'ē-bēs or sēl'ē-bēz, Dutch East Indies, one of the larger islands of the Indian Archipelago, between Borneo on the west and the Moluccas on the east, extending from lat. 1° 45' N., to 5° 52' S., and from lon. 118° 45' to 125° 17' E., remarkable for the singularity of its shape. It consists mainly of four large peninsulas stretching to the east and south, and separated by three deep gulfs. The total area of the island is a little over 71,000 square miles.

Celebes is high and mountainous chiefly in the centre and the north, where there are several

CELERES — CELERY

active volcanoes. The absence of extensive deltas, and the intervention of broad grassy plains between the forests, distinguish it from the other larger islands of the Indian Archipelago. All that is most majestic and lovely in these is thought to be concentrated in this island. It abounds in the most picturesque and varied scenery, and the most beautiful and magnificent tropical vegetation. Though cut by the equator, and wholly within the torrid zone, Celebes is considered remarkably healthful, the natives often enjoying a vigorous old age, and Europeans living longer than anywhere else in the East. Its extreme heats are tempered by the sea-breezes, by monthly rains, and by the north winds that prevail for part of the year. The east monsoon lasts from May to November, and the west during the remaining months. The soil generally consists of a bed of vegetable mold from 10 to 20 feet thick, on decomposing basalt. Gold is found in all the valleys of the north peninsula, which is often convulsed by earthquakes, and abounds in sulphur. Copper of good quality occurs at various points, and in Macassar tin also, as pure as that of Banka. Diamonds are sometimes found almost at the surface of the ground, and precious stones are carried down in the sand of the torrents. The island is entirely destitute of the large carnivorous animals and pachyderms. None of the cat kind are seen in its forests; nor has it the elephant, the rhinoceros, or the tapir. Deer and wild hogs abound, together with the babirusa and herds of antelopes. Pouched animals, unknown in the Sunda Islands, here first occur, and there is a black tailless baboon or ape. Among domesticated animals are found small but vigorous horses, buffaloes, goats, sheep, and pigs. Trepan and turtle are caught in abundance. Among the trees are the oak, teak, cedar, upas, bamboo, etc.; among plants requiring more careful cultivation, the coffee-tree, indigo, cacao, sugarcane, manioc root, and tobacco.

The maritime districts of Celebes are inhabited by Malays; the Peninsula of Macassar by Bugis and Macassars. Mandhars dwell in the west of the island, and the mountainous regions in the interior are inhabited by Alfures. In the harbors also there are many Chinese and Orang Badjus or Orang Laut, a mixed race partly of Malay and partly of Battak origin, who live in their boats, and roam over the whole archipelago, gaining their livelihood by fishing. The natives are subject to several petty rulers, more or less dependent on the Dutch. The capital is the town of Macassar, in the southwest of the island, in the bazaar of which are sold all the products of the neighboring islands as well as of Celebes itself, among which are bamboo canes, sandal-wood, cajeput oil, nutmegs, rice, coffee, pearls, birds'-nests, trepan, birds of paradise, etc. The trade in trepan is very important, Macassar being the chief staple place for this article of commerce. The chief harbor of the north is that of Kema, on the east coast of Minahassa. The coffee of Menado is excellent, and is even preferred to the best Javanese coffee. A recent return states the number of coffee-trees in Minahassa at nearly 6,000,000 and the export of coffee at about 5,000,000 pounds. The harvest of coconuts is also considerable. A European controller superintends the cultivation of the coffee-tree in his own district, advises the village chieftains,

acts as the protector of the natives, and negotiates between them and the Dutch government.

The languages and literature of Celebes differ essentially from those of the countries to the west. The letters of its alphabet are in form as unlike the Javanese as the latter are unlike the Arabic or Roman. The three great languages of the island, not reckoning the dialects of the savage tribes, are those of the Bugis, the Macassars, and of Mandhar. The modern Bugis is the most cultivated and copious; the Macassar is simpler, and its literature more scanty; both are distinguished for a soft and vocalic pronunciation. The Bugis have a considerable body of literature. The more civilized inhabitants profess Mohammedanism; but previous to the introduction of that faith, the Hindus had brought their religion to the island.

The island of Celebes was first visited by the Portuguese in 1512. In 1607 the Dutch entered into commercial relations with Macassar, and gradually acquired and extended control until, early in the 19th century, they made their supremacy complete. The population is estimated at nearly 2,000,000.

Cel'eres, a body of horsemen traditionally said to have been introduced by Romulus, and to have numbered 300, consisting of citizens rich enough to furnish a horse. They are also described as subdivided into three centuries, under the name of Ramnes, Titenses, and Luceres. The number of the centuries of the Celeres is said to have been raised to six by Tarquinius Priscus, this being the origin of the equites or knights, who in after times formed a separate class of citizens.

Celeriac, sê-lër'î-âk. See CELERY.

Cel'ery, a biennial or annual herb (*Apium graveolens*), of the natural order *Umbellifera*. It is a native of Europe, Asia, and Africa, in the older civilized parts of which it was cultivated prior to the Christian era. In nature the plants are commonly found in moist ground, where they attain a height of from 6 to 15 inches. They have numerous leaf-stalks odd-pinnate leaves, and branching leafy flower-stalks two to three feet tall and bearing many small umbels of small white flowers which give place to seeds (fruits) so small that 60,000 or more are needed to weigh an ounce. Cultivated celery does not differ in general characteristics from the wild plant, but by cultivation its leaf stalks (the part desired for the table) have been made more solid, less stringy, and more agreeably flavored. In many instances, too, they have been lengthened or increased in number, and made to form more compact plants. Celery is usually blanched and eaten raw with salt, but often it is used as a cooked vegetable, and its leaves, roots, or ground seeds are frequently used for flavoring. Celeriac or turnip-rooted celery is largely grown in Europe, but little in America. It does not require blanching, but is otherwise cultivated like celery.

Celery is usually started in unheated beds, and the young plants set out in the field when a few inches tall, after being transplanted once or sometimes twice. The soil best suited to the plant is a rich, friable, peaty loam well supplied with moisture, but well drained. As the plant is a gross feeder abundant manure must be given. Celery will, however, do well in any

CELESTE — CELESTINE IV.

moist, rich garden soil. In one method of growing, the plants are set about six inches apart in rows spaced from three to four feet, and the ground is kept loose and free from weeds by frequent cultivation, the plants being gradually covered with earth, or "earthed up," as they approach edible size, or they may be blanched by shading the stems with boards, straw, etc. In another method they are set closer together in the rows, which are rarely more than 12 inches apart. The size of the variety is a governing factor in the matter of distances; some varieties grow only 12 or 15 inches tall, others more than two and a half feet. In this "new celery culture" no earthing-up is necessary, as the plants blanch themselves. Summer celery is blanched quickly by the former method; autumn and winter celery more slowly. Indeed, the process is frequently continued in the winter storing quarters, which usually consist of specially constructed houses or cellars, the floors of which are covered with a few inches of earth, in which the roots obtain some food and water.

Celery is frequently attacked by parasitic diseases, but most of its insect enemies are controlled by parasites and rarely become troublesome enough to demand special attention. The chief fungous parasites are sun-scald or rust (*Cercospora apii*), which appears upon the leaves as yellow or gray blotches which enlarge and gradually destroy the whole leaf. It is more frequent on plants grown in dry soils. Leaf-blight (*Septoria pectoselina apii*) appears on the leaves and stems as watery spots which become dotted with black spores. These parasites may be controlled by spraying with a standard fungicide (q.v.). Several other parasites are occasionally troublesome, but they can usually be similarly controlled.

In the United States the celery industry developed enormously during the closing quarter of the 19th century. From being restricted to the individual gardens and fields of market gardeners who grew it as one of their ordinary crops, it has in many localities become a specialized business, with machinery adapted to its particular needs. And from demanding only part of the time of the market gardener it now occupies the attention of hundreds of men in certain districts. In Michigan, California, and New York there are thousands of acres devoted to this crop, and from some of these districts hundreds of carloads of celery (even trainloads from California) are sent to Chicago, St. Louis, Kansas City, New York, Boston, Philadelphia, and other large distributing centres. Instead of having celery as a delicacy for a few weeks during autumn and winter, American tables are supplied throughout the year with this vegetable, which has risen to the rank of a necessity, a development due mainly to improvements in the management of the crop, but partly to improved transportation and storage methods.

In medicine celery enjoys a certain popular reputation by reason of the apiol which it contains. This has an action similar to that of many of the volatile oils, but in addition it dilates the blood vessels, particularly of the pelvic viscera and is, therefore, useful in disorders of menstruation, in chronic constipation, and disordered intestinal states in general. It is also diaphoretic and diuretic.

Consult Greiner, 'Celery for Profit'; Van Bohone, 'Kalamazoo Celery'; Hollister, 'Liv-

ingston's Celery Book'; Duggar and Bailey, 'Notes Upon Celery'; 'Cornell University Agricultural Experiment Station Bulletin' 132; Bailey, 'Cyclopedia of American Horticulture.'

Celeste, se-lěst, **Madame**, French actress: b. Paris 6 Aug. 1814; d. there 12 Feb. 1882. A pupil at the Conservatoire, she early showed remarkable talent. She made her début in 1827 at New York, and during her residence in the United States married a Mr. Elliott. At Liverpool, in 1830, she played Fenella in 'Masaniello'; in 1831-3, she became extremely popular in London. Her second visit to the United States (1834-7) is said to have brought her \$200,000. After her return she took part successively in the management of the Theatre Royal, Liverpool, and the Adelphi and Lyceum in London. Her imperfect English long confined her to non-speaking parts. She retired from the stage in 1874.

Celestial Empire, **The**, a popular name for the Chinese Empire, taken from the Chinese appellation for the country, "Tien Chao" (Heavenly Dynasty). Hence the name "Celestials," applied to natives of China.

Celestial Sphere, the skyey background on which all celestial objects appear projected. It is supposed to be of indefinite radius, with the observer at the centre. It is crossed by systems of imaginary circles which serve to fix positions upon its surface by means of spherical co-ordinates. See CO-ORDINATES.

Cel'estine I., Saint, a Pope memorable in the annals of the Church as having convoked the general council of Ephesus, 431; as having given to Palladius and Patricius mission to the Irish and the Caledonians, and as having checked the progress of Pelagianism and Novatianism. Of his birth or his age there is no record, but he died in 431 and his day in the Roman calendar (that is, the day of his death) is 7 April: he occupied the see of Peter about eight years and a half. Celestine was represented in the Ephesine council by his legates, and at his instance the council condemned the heresy of Nestorius; and of his letters to bishops of various churches both in the East and the West, communicating to them the council's decrees, four are extant, namely: those to the African bishops and to the bishops of Illyria, of Thessalonica, and of Narbonne.

Celestine II., Pope (Guido di Castello): b. Tiferno, Tuscany; d. Rome 8 Jan. 1198. He had studied under Abelard, and succeeded Innocent II. in 1143. It was this pontiff who granted absolution to Louis VII. of France, and removed the interdict which for three years was laid upon that country.

Celestine III., Pope (Giacinlo Orsini): b. about 1106; d. Rome 8 Jan. 1198. He succeeded Clement III. in 1191, when, it is believed, about 90 years of age, and reigned till 1198. He crowned the emperor Henry VI. of Germany in 1191, but afterward excommunicated both Henry and Leopold, duke of Austria, on account of the captivity of Richard Cœur de Lion.

Celestine IV., Pope (Goffredo Castiglione): b. Milan; d. 22 Sept. 1241. When a monk at Hautecombe in Savoy, he wrote a history of Scotland. He was elected Pope in 1241, but reigned only 17 days, having died, it is said,

CELESTINE V.—CELIBACY

of poison before the ceremony of consecration was performed.

Celestine V., Saint, a Pope celebrated as the one occupant of the papal see who, his title undisputed and no demand made for his retirement, voluntarily and of his own motion abdicated the pontificate. He was a Neapolitan, born in 1215, and while a lad entered the order of Benedictines. From the first he practised the greatest austerities, and at the age of 24 years, for the sake of freedom in the pursuit of religious perfection, he quitted the monastery and adopted the solitary or eremitical life in a cave of Mount Morone, whence his surname, Peter di Morone. After five years spent in this solitude he, with two companion hermits, migrated to a similar cave in the Monte di Majella in Bruttium. Here disciples flocked to him in scores, and to these he gave a rule of life and thus laid the foundation of a new monastic order which later received papal approval; after the death of the founder the order assumed the title of Celestines. While Peter di Morone was, as superior-general, governing 36 communities of the new order comprising 600 monks, he was elected Pope 7 July 1294. He protested vigorously against this unexpected promotion, but at last was prevailed upon to assume the burden of the papacy. As Pope he promulgated two decrees, one re-enforcing the rule which requires that the cardinal electors of a Pope shall be strictly secluded in the conclave; and the other that a Pope may lawfully and validly lay down his office. At the end of five months and eight days he acted on this definition and abdicated, out of a desire, as he publicly declared, "for humility, for a purer life, for a stainless conscience, and in view of his lack of physical strength, his ignorance, the perverseness of the people, and his longing for the tranquillity of his former life." All eminently strong and good and honorable reasons, and worthy of the sincerely religious soul that was moved by them. His successor in the papacy, Boniface VIII., doubtless fearing lest the honest hermit should repent of his abdication and resume the papal title, made him a prisoner and confined him in a strong castle where he died, after languishing 10 months, 19 May 1296. Some commentators of Dante ('Inferno,' iii., 60) think that Celestine is the damned soul,

Who to base fear
Yielding, abjured his high estate,

(Cary's trans.), or as the verse is rendered by Longfellow—

The shade of him
Who made through cowardice the great refusal.

But as has been well remarked, "Dante knew better than to consign a man to eternal pain for having declined the path of ambition." Celestine V.'s day in the Roman calendar is 19 May, but he is there styled not simply Saint Celestine, but Saint Peter Celestine (Petrus Celestinus). His canonization took place 11 years after his death. See CELESTINES.

Cel'estine, in mineralogy. See CELESTITE.

Cel'estines, a monastic order of the Roman Catholic Church, a branch of the great Benedictine order. It was founded by Pietro di Morone, afterward Pope Celestine V. (q.v.). To Pietro di Morone, who was leading an eremitical life in a wilderness, so many men re-

sorted for spiritual guidance that he was induced to form them into a religious community under a rule drawn up by himself. The institute was approved by Pope Urban IV. in 1264, 10 years after it had been founded, but not as an independent order, for it was made a branch of the Benedictines, under a rule based on the rule of that order. The mother house of the institute was on Monte Majella in the Abruzzi, and 30 years after it was affiliated to the Benedictine order its primacy was acknowledged by 36 establishments having 600 members. The founder now relinquished the office of superior-general and resumed his former eremitical life. After Pietro was made Pope Celestine the order, till then known as Hermits of Saint Damianus and popularly as Moronites, took the name of Celestines. The order spread throughout Italy and beyond the Alps to France, Germany, and Flanders: so strong was its French branch early in the 15th century that it obtained for itself from the popes bulls that made it in a measure independent of the superior-general. But in the 17th century the order was already in process of rapid decay, and in the 18th many of its establishments were dissolved by papal decree, and many more by the secular powers. The order is now extinct.

Cel'estite, a native form of strontium sulphate, SrSO_4 , crystallizing in the orthorhombic system, and also occurring in fibrous and radiated forms. The crystals resemble those of barite, and are usually tabular or prismatic. They have a hardness of from 3 to 3.5, and a specific gravity of 3.96. Celestite is commonly white with a vitreous lustre, but it also occurs with a pronounced bluish tinge, from which circumstance it received its name. When found in quantity it is a useful source of strontium. Fine crystals of it occur in the limestone about Lake Erie. Other important localities are in Sicily, Hungary, England, Canada, West Virginia, and California. Varieties containing large amounts of calcium or of barium are called calciocelstite and barytocelstite respectively; and the mineral itself is often called celestine.

Cel'ibacy, the state of being unmarried; especially the voluntary single life undertaken by religious devotees and by some clerical orders, as those of the Roman Catholic Church. Paul (1 Cor. vii.) recommends virginity, without condemning matrimony. The Roman Catholic Church respects matrimonial chastity, but esteems virginity a higher virtue.

From the time of the apostles it became a custom in the Church for bishops, priests, and deacons to renounce matrimony at their consecration, and to devote themselves entirely to the duties of their office. One point only was disputed, whether clergymen were to be merely prohibited from marrying, or whether even those who were married before their consecration should be required to separate themselves from their wives. At the Council of Nice several bishops proposed that the bishops, priests, and deacons who had received the holy consecration, should be directed by an express ordinance to give up their wives. But Paphnutius, bishop of Upper Thebais, contended that cohabitation with a wife was a state of chastity. It was sufficient, he said, according to the ancient traditions of the Church, that men in sacred orders should not be permitted to marry; but he who

had been married before his consecration ought not to be separated from his lawful wife. As it became the general opinion that a clergyman could not marry, it soon became the general practice to refuse consecration to married men. By this means uniformity was effected. As for the bishops, it soon became a matter beyond dispute. When monachism had become firmly established, and the monks were regarded with veneration on account of their vow of perpetual chastity, public opinion exacted from the secular clergy the same observance of celibacy. Epiphanius assures us that by the ecclesiastical laws celibacy was commanded, and that wherever this command was neglected it was a corruption of the Church. The Council of Elvira commanded all bishops, presbyters, deacons, and subdeacons to abstain from their wives, under penalty of exclusion from the clergy. In the Western Church celibacy was rigorously required. Pope Siricius, at the end of the 4th century, forbade the clergy to marry, or to cohabit with their wives if already married. At the same time the monks received consecration, which increased the conformity between them and the secular clergy still further, and indirectly obliged the latter to observe celibacy. The Emperor Justinian declared all children of clergymen illegitimate, and incapable of any hereditary succession or inheritance. The Council of Tours, in 567, issued a decree against married monks and nuns, declaring that they should be publicly excommunicated, and their marriage formally dissolved. Seculars, deacons, and subdeacons, who were found to dwell with their wives, were interdicted the exercise of spiritual functions for the course of a year. In Spain, where many priests refused to conform to the requirements of the Church, the bishops were ordered to enforce celibacy upon their abbots, deacons, etc., once a year in their sermons.

As in other points of discipline, in this also the Greek Church dissented from the Roman. The (Trullan) Council of Constantinople, in 691, in its 13th canon, declares: "We hereby forbid anyone to refuse the consecration of a priest or deacon on account of his being married, and cohabiting with his wife after he has requested consecration. We will by no means be unjust to marriage, nor separate what God has united." This regulation is still in force. Celibacy is indeed required of the bishops and monks, but priests and deacons, if married before ordination, are allowed to continue in this state. They cannot marry after ordination.

The Roman Catholic Church, then, has retained celibacy as an old apostolical tradition, to which she has added the rule not to consecrate married men unless the wife enter a religious order. As no one has a right to demand to be consecrated a priest, the Roman Church has, by this addition, violated no one's right. Her position, therefore, is expressed by saying that, profoundly convinced that an unmarried clergy is best suited to her work, she admits to her ministry only those who voluntarily engage to lead a celibate life, and as long as she finds a sufficient number of such candidates she refuses to hamper her work by the employment of others. While, however, the Church persevered in commanding celibacy, she had to struggle with the opposition of those who among the clergy represented corruption.

A reformer appeared in Gregory VII., who, in order to reform the discipline of the Church, was obliged to encounter simony and licentiousness in some of the clergy. The former he checked by opposing the emperor's right of investiture, and he enforced the laws of celibacy by new regulations. In the Council of 1074, at Rome, he ordered that all married clergymen and all laymen who should confess to them, hear mass of them, or be present at any divine service performed by them, should be excommunicated. This met with much opposition, but in spite of that Gregory succeeded, as he was supported by the most ancient and most undoubted canons. After Gregory's death the Church continued in the same course. Still the question of celibacy has continued down to recent times to be the subject of fresh agitations and contests. All through the first half of the 19th century there were periodical attacks upon this rule of the Church, in which almost every Catholic country of Europe was represented. These movements have occurred alike within the communion of the Church and among secular and political bodies. They have usually been inspired by concern for the welfare of the Church and for the character and perpetuity of its priesthood, but no result has thereby been gained in any alteration of the ecclesiastical discipline.

The rule of celibacy has been more strictly observed in the Roman Catholic Church since the Reformation than it was before. The far greater number of the Catholic clergy have continued to respect it. Among the reasons sometimes urged against requiring celibacy in the clergy is the scarcity of men willing to devote themselves to a profession which calls for such strict self-denial. This, however, is said to be not true in point of fact, since statistics show a marked increase in the number of candidates for the priesthood at the present time.

Cell, the primary element of the bodies of plants and animals. A cell is a microscopic portion or bit of protoplasm (q.v.) either with or without a wall, and with usually, probably always, a nucleus. Cells are originally more or less spherical sacs, and the protoplasmic contents is the cell, that is, its dynamic portion. The cell is the morphological unit of the organic world. The size of cells varies, but they are mostly microscopic, the sperm cell (spermatozoon) being even less than 0.003 mm. in diameter. The egg-cell—for all unfertilized eggs are simple cells—may, as in that of the fowl, goose, or ostrich, be several inches in diameter. The largest unicellular organisms are the giant plasmodia of the *Mycetozoa*. While the free cells are spherical, when they are united into tissues they may by mutual pressure form polygonal or prismatic bodies, or may send out spindle or star-shaped branching processes, or a nerve-cell may send out a long, fine nerve-fibre.

History of the Cell Theory.—The term "cell" was first used in the 17th century by Hooker, Malpighi, and Grew in writing of vegetable anatomy. They had in mind small chambers surrounded by firm walls and filled either with air or fluid. The English botanist Brown discovered the nucleus. Schleiden then framed his cell theory, laying emphasis on the nucleus. While his view was somewhat erroneous,

CELL — CELLARDYKE

Schwann applied Schleiden's views to the animal world, and the cell theory was spoken of as the Schleiden-Schwann theory. From their point of view the cell-membrane was regarded as most important for the function of the cell; but, after that, the conceptions as to the true nature of the cell completely changed. It was seen that the protoplasm was the essential part of the cell. It was observed that it owed its origin to a previous cell, a living mother-cell. Hence Virchow's aphorism, *Omnis cellula ex cellula*. Then followed the discovery of protoplasm (q.v.) by Dujardin, Mohl, Schultze, and others, so that now the cell is regarded as a lump or bit of protoplasm.

Nucleus.—This is the central specialized portion of the cell, and the part in which reproduction begins. The nucleus may vary in shape in each kind of cell. While usually spherical it may be oval, club-shaped, bent into a U, or be branched. It also varies much in size, sometimes forming almost the whole of the cell, but sometimes so small as to be found with difficulty, and only by employment of a special technique. The substance of which the nucleus is composed is distinguished from protoplasm, besides other characters, by its greater coagulability in certain acids (acetic and chromic).

Structure of the Nucleus, Chromatin and Chromosomes.—A portion of the nucleus reacts to certain staining-fluids (carmine, hæmatoxylin, and safranin); this is therefore called "chromatin" (by some "nuclein"). The other substance, which does not stain, or only under special conditions, is called achromatin or linin. The chromatin forms a honeycomb structure (by other authors regarded as a network or reticulum) filled with a nuclear fluid, bounded externally by a nuclear membrane.

The chromatin enters into close relations with a less stainable substance, the plastin or paranuclein, also sharply distinct from achromatin. In the nuclei of *Protozoa*, plastin and chromatin are usually intimately united, the latter being embedded in the plastin. Both of these substances are usually so closely and regularly distributed as fine granules on the reticulum that the entire nucleus appears to be uniformly chromatic. The mixture sometimes collects into one or more special bodies called the chromatic nucleoli. The nucleolus is usually a rounded body (Hertwig).

In the *Metazoa*, or many-celled animals, the plastin (apparently not the whole, but a surplus) is separate from the chromatin. Thus there occur, in the nuclei of many eggs, nuclei which contain, the one chromatin, the other exclusively plastin.

Significance of the Cell Nucleus.—It is now well known that the seat of the reproduction process is in the nucleus. It has lately become apparent that the nucleus determines the character of the cell, and, again, that it is also "the bearer of heredity" (see HEREDITY). Within the nucleus the chromatin is now supposed to control the functions of the protoplasm, and therefore is the bearer of heredity, while the achromatin is the seat of contractility, and as such plays a part in cell-multiplication (Hertwig).

The Centrosome.—In addition to the nucleus there frequently occurs a special body in the protoplasm, called the "centrosome." It is supposed to be a derivative of the nucleus, either

a part of the achromatin which has left the nucleus; or a second nucleus which by degeneration has lost the chromatin and retained only the active nuclear substance, the achromatin. The centrosome functions as a specific organ of cell-division which controls both the division of the nucleus and that of the cell itself. See KARYOKINESIS; MITOSIS; PROTOPLASM; REPRODUCTION.

Consult: Hertwig, 'The Cell'; 'A Manual of Zoology'; Wilson, 'The Cell in Development and Inheritance.'

Cell, a small chamber; the dwelling of a hermit; a lesser or subordinate religious house dependent upon a greater, by which it was erected, and under whose government it remained. The apartments or private dormitories of monks and nuns are also called cells.

Cell, in mechanics. See PEACELLIER CELL.

Cell Electrical. See BATTERY.

Cella, the windowless hall or central apartment of a Greek or Græco-Roman temple. This was often divided into two chambers of unequal size; the naos, in which was the statue of the divinity for whose worship the temple was built, and the thesauros or treasury. The cella was formerly supposed to have been roofless, or partially roofless, but later scholars believe it to have been lighted only through the doors or by artificial light. In the larger temples the roof was internally supported by the rows of columns in the cella, frequently in two superposed ranges.

Cellamare, Antonio Guidice, ân-tô'nê-ô gē-dē'chā thāl-ya-ma'rā, PRINCE OF, Spanish ambassador: b. Naples 1657; d. Seville 16 May 1733. He was educated at the court of Charles II. of Spain, and took a prominent part on the Spanish side in the war of Succession. In 1707 he was taken prisoner by the Imperialists, and detained five years in Milan. On obtaining his liberty he returned to Spain, and in 1715 was appointed ambassador extraordinary at the French court. Here, having entered into Alberoni's scheme, he became head of a conspiracy for supplanting the regent, Philip of Orleans, and appointing Philip V. regent of Spain and France. The plot was discovered, and Cellamare was marched off under a guard to the Spanish frontiers. He was afterward made captain-general of Old Castile, and held the office at his death. A romance of Vatout, entitled the 'Conspiracy of Cellamare,' gives an account of the conspiracy with tolerable accuracy.

Cell'lar-snail, a species of land-snail (q.v.) (*Zonites cellaris*). It has been introduced from Europe, and has become common in cellars, hot-beds, and gardens of the seaport towns along the Atlantic coast. The shell is small, much flattened, thin, and has a large umbilicus.

Cell'lardyke, Scotland, a village on the southeast coast of the county of Fife, between Anstruther-Easter and Kilrenny. It is an eastern extension of the former, but is united as a royal borough to the latter. The inhabitants are chiefly engaged in or connected with the fishing industry; the village contains three fishing-gear factories and also oil-skin works. Pop. 1,662.

CELLE — CELLULOSE

Celle, tsĕl'lē, or **Zelle**, a town in Prussia. See ZĒLE.

Cellier, Alfred, English composer: b. Hackney, England, 1 Dec. 1844; d. London 28 Dec. 1891. He was the son of a French father and an English mother and from 1855 to 1860 was a chorister of the Chapel Royal, Saint James. In 1862 he became organist of All Saints' Church, Blackheath; at 20 he directed the Ulster Hall concerts at Belfast, and in 1868 was organist of Saint Alban's, London. He conducted at the Prince's Theatre, Manchester, 1871-5; and at the Opera Comique, London, 1877-9. Besides much music for orchestra and piano he composed among other operas: 'The Tower of London' (1875); 'Nell Gwynne' (1876); 'The Masque of Pandora' to the words of Longfellow's poem (produced in Boston 1887); 'The Sultan of Mocha'; 'Dorothy' (1886); 'The Mountebanks' (1892). The last named work was produced a week after its author's death.

Cellini, Benvenuto, bān-vā-noo'tō chĕl-lē'nē, Italian sculptor, engraver and goldsmith: b. Florence 1500; d. there 25 Feb. 1571. Of a bold, honest, and open character, but vain and quarrelsome, and impatient of encroachment and dependence, he was often entangled in quarrels which frequently cost his antagonists their lives. He himself incurred great dangers, was put into prison, and was saved only by his boldness and the powerful protectors whom his talents as an artist procured him. His autobiography is a production of the utmost energy, directness, and racy animation. The vanity and self-satisfaction displayed throughout the work are excessive and highly amusing. It not only contains a very full information respecting his life and professional pursuits, his amours and hatreds, his passions and delights, his love of art, his extravagances, his self-applause and self-assertion, and describes, all ranks of persons with whom he was connected during his strange career, but furnishes a very lively and doubtless a tolerably accurate picture of the state of society during the 16th century. This work has been translated in a masterly manner by Goethe into German. There are also English translations, Nugent (1771), revised by Thomas Roscoe (1822); and Symonds (1887). Among his other writings the most important are 'Due Trattati uno intorno alle Otto Principali Arti dell' Oreficeria l'altro in Materia dell' Arte della Scoltura' (best edition 1731). His 'Opere' were published at Florence in 1843. See Symonds, 'The Renaissance in Italy' (1885); Leader Scott, 'Sculpture, Renaissance and Modern' (1886).

Cellites, or **Alexian Brothers**, a religious order, so called from their patron saint Alexius, and from *cella*, tomb, from the fact that their life often leads to an early grave. The brotherhood arose in Meclilin about 1300, to check the ravages of the "black death," and soon spread through Germany, Brabant, and Flanders. At first the Cellites were merely a pious society, intended to harbor the poor and indigent free of charge, to serve the sick, and bury the dead. In 1469 they were organized as a religious order, and, favored by the popes, they established houses in many parts of Europe. In the United

States, they have a hospital in each of the following cities: Chicago (founded in 1861); St. Louis (1869); Oshkosh, Wis. (1880); and Elizabeth, N. J. (1893).

Cel'luloid, an artificial substance extensively used as a substitute for ivory, bone, hard rubber, coral, etc., having a close resemblance to these substances in hardness, elasticity, and finish. It is composed of cellulose or vegetable fibrine reduced by acids to gun-cotton. To this, camphor is added, with the required coloring matter, and the mixture, after being condensed in cylinders, is then molded by heat and pressure into various useful and ornamental articles.

Cel'lulose, a chemical substance closely allied to starch, which occurs in all plants, and is the essential constituent of the walls of the cells. It is especially prominent in young plants, and with age it becomes more or less completely converted into lignin and other analogous products. Cotton fibres are composed almost entirely of cellulose, and such other substances as they do contain are readily removed by treatment with alkalis, alcohol, ether, etc. Cellulose has the chemical formula $n(C_6H_{10}O_5)$, and is therefore a carbohydrate. In some respects, it is widely different from starch, but in others it resembles starch very closely. It may be said, in general, that the chemistry of all the substances that are intimately related to the starches, gums, and sugars is still very imperfectly known. Cellulose is specially remarkable for its insolubility and its chemical stability. It may be decomposed and caused to enter into combination with other bodies, but the only solvent known, which will dissolve it without destroying its chemical identity, is an ammoniacal solution of cupric oxide. From its solution in this menstruum, cellulose may be again precipitated in apparently unchanged chemical form, though in a physically amorphous condition. Unglazed paper (which is nearly pure cellulose) is converted, by the action of strong sulphuric acid, into a parchment-like substance that is known as vegetable parchment, or parchment paper. By the action of a mixture of strong nitric and sulphuric acids, cellulose is converted into a sort of nitrate, which is commercially known as gun-cotton (q.v.). Collodion is a solution of gun-cotton in a mixture of ether and alcohol. By the prolonged action of sulphuric acid cellulose is partially converted into glucose, and various other reactions are also known with sulphuric acid according to the conditions under which the experiment is made. When strongly heated out of contact with the air cellulose is destroyed, with the formation of acetic acid, methyl alcohol, and many other products. These transformations occur in the distillation of wood in the manufacture of wood alcohol. (See ALCOHOL.) It is probable that true cellulose occurs only in plants; but a substance that is closely analogous to it, and which is believed by some authorities to be identical with it, is found in the tissues of ascidia and other molluscan animals.

Cellulose as prepared from corn pith is now used to a considerable extent in ships of war, to prevent the entrance of water through shot-holes. For this purpose it is disposed within the steel hull along the water line, in the form of a belt some three feet in thickness. For several years a packing of cocoa fibre was used in this

way, but corn pith is now preferred, and is used on the Kearsarge, Alabama, Kentucky, and Illinois. The great superiority of the corn pith lies in the fact that as soon as the water reaches it the pith swells and automatically closes the shot-hole.

Celma, a Thessalian woman, who, with her husband, Celmus, was changed into adamant for denying the immortality of Jupiter.

Celman, Miguel Juarez. See JUAREZ, CELMAN.

Celsius, sĕl'sī ūs, the name of a Swedish family, several members of which attained celebrity in science and literature: 1. **MAGNUS CELSIUS**: b. in the old province of Helsingland, 1621; d. 1679. He became professor of mathematics in the University of Upsal and published two works on the antiquities of his native province and was the discoverer of the Helsing runes. Besides mathematics and archæology, he cultivated poetry with some success, and was so skilled in practical mechanics that he himself made all the scientific instruments he required in his astronomical observations, etc. 2. His son, **NILS CELSIUS**: b. 1658; d. 1724; also filled the mathematical chair in Upsal University. 3. **OLAF CELSIUS**, another son of Magnus: b. 1670; d. 1756. He early became famous as an earnest student of the Oriental languages and of botany. He was successively appointed to the chairs of Greek, Oriental languages, and theology, and filled the office of provost of the cathedral at Upsal. He devoted a good deal of attention to the study of runology, and was among the first to recognize the genius of Linnæus, whom he liberally patronized. In 1745-7 he published his voluminous work 'Hierobotanicon,' a description of all the plants mentioned in the Bible. 4. **ANDERS CELSIUS**, son of Nils Celsius, and the most distinguished of the family; b. 27 Nov. 1701; d. 1744. After being appointed professor of astronomy at the University of Upsal, he traveled in Germany, England, France, and Italy; and in 1736 took part in the famous expedition that was undertaken by Maupertuis, Clairaut, Camus, and others, for the purpose of measuring a degree of the meridian in Lapland. For his services in this expedition he received a pension from the French king. He is best known at the present day as the constructor of the Centigrade thermometer. 5. **OLAF CELSIUS** the younger, son of the Orientalist and naturalist, and cousin of the preceding: b. 1716; d. 1794. He became Bishop of Lund, and devoted himself to history and poetry. His principal historical works are: 'Ecclesiastical History of the Kingdom of Sweden'; 'History of Gustavus I.'; 'History of Erik XIV.'

Cel'sius Scale, the Centigrade thermometric scale. The name is from that of the inventor, Anders Celsius, who about 1741 attempted the precise graduation of thermometers. He took the melting-point of ice as 0°; and the boiling-point of water, under standard atmospheric pressure, as 100°. See THERMOMETER.

Cel'sus, pagan philosopher, an antagonist of the Christian religion in the second century. He is believed to have been the same Celsius, friend of Lucian, to whom is inscribed Lucian's satirical sketch of the life of the noted impostor and pseudo-thaumaturgus Alexander of Abono-

tichus, entitled 'Pseudomantis.' No work of Celsius has come down to us in its integrity or in its original form, but his 'True Discourse' is in substance preserved for us in the eight books of Origen's computation of the arguments brought by Celsius against the truth of the religion of Christ: Origen quotes textually long passages from the 'True Discourse' in his work 'Against Celsius.' From these passages it is seen that Celsius had accurate knowledge of the religious creed and practices, both of the Jews and Christians, and he skilfully puts in the mouth of a Jew his criticism of the life of Jesus as told in the gospels. Celsius himself appears to have been an epicurean and a scoffer at the supernatural, while his Jew is a firm believer in miracle, but for all that he cannot accept the gospel stories. He rejects the doctrine of the Incarnation of God, and reports a scandalous story of an amour which he offers as a substitute for the evangelists' narrative: and the fact Origen quotes the passage containing this shockingly blasphemous suggestion (as it must have been regarded by him) is evidence that the Christian polemist is dealing fairly with his antagonist. According to Celsius Jesus once visited Egypt and there learned the art of the jugglers; in his own country he easily won reputation as a wonder-worker, even a god. By his jugglery he might have made the multitude present at his immersion by John in Jordan believe that they heard a voice from heaven. If he was God, he would have made a better choice of apostles: why did he choose Judas? The story of the resurrection is self-contradictory. His death by crucifixion is undisputed and was a fact of public notoriety; if he rose from the dead, why did he not make that fact equally notorious and public? With such objections Celsius attacks the Christian faith in the first half of his work; in the second half he speaks in the person of a Grecian philosopher. Whatever is true and good in the Christian system exists already in the schools of philosophy: therefore let the Christians abandon their narrow sectarianism and separatism, and combine with all good and wise men in upholding the principles of good government. Celsius then advances philosophical arguments against the credibility of the Christian mysteries, in particular the Incarnation. God cannot assume a mortal body either in reality or in appearance only: not really, for that would be contrary to his nature; not in appearance, for that would be a fraud. But the idea of an incarnation of God is absurd: what could be gained by an incarnation? Certainly no advantage for God; but neither for men: do men know God better for seeing him in bodily form? Did God a little while ago waken from sleep and resolve to save a few men from sin, leaving the mass of mankind to go down to hell?

Celsus, Aurelius, or Aulus Cornelius, Latin writer on medicine who lived, probably, under the reigns of Augustus and Tiberius. He has been called the Roman Hippocrates, because he imitated the Greek physician, and introduced the Hippocratic system into Rome. He also wrote on rhetoric, the art of war, and agriculture. He is, however, best known as a medical writer. His style is elegant, and though concise, is very perspicuous. His work on medicine is an inexhaustible source from which other authors have

CELTES — CELTIC LANGUAGES

drawn materials. Eighty editions of his eight books 'De Medicina' have appeared; the first at Florence (1478). There is an English translation by Grieve (1756), and an edition, Latin and English, by Lee (1831). The edition by Védrenes (Paris 1876) contains a French translation.

Celtes, tsel'tes, **Konrad**, German humanist: b. 1459; d. 1508. His most celebrated work is a volume of 'Odes' (1513). He did much to promote the study of the classics, and wrote his own poems in Latin.

Celtiberi, a people of ancient Spain, supposed to have arisen from a union of the aborigines, the Iberians, and their Celtic invaders. Various limits have been assigned to their country, which included probably all the north of Spain as far south as the sources of the Guadalquivir. Hannibal subdued the Celtiberi, and they afterward passed under the Roman yoke. They revolted in 181 B.C., and were subdued by Tiberius Gracchus 170 B.C. Two struggles for independence followed, called respectively the first Celtiberian Numantine, and the second Celtiberian or Sertorian wars, in the latter of which they were finally vanquished, and after 72 B.C. do not again appear in history.

Celtic Church, the designation specially appropriated to the Christian Church founded in North Britain among the Celtic population by Ninian, Columba (Columcille) and other Celtic apostles. Of these the most notable is Columba. He was a native of Ireland and a scion of the royal line of Niall and a kinsman of Conal, king of Ailbe or Albin, later called Scotia. Columba and all his companion missionaries to the Scots and Picts were monks, and the churches he and they founded, whether on the mainland or in the Western Isles, were essentially monastic in their form of government. In the Holy Isle, Iona, called also after the name of the Gaelic apostle, Hy-Columcille, which was the metropolis of Celtic or Gaelic Christianity, Columba was arch-abbot of all the monastic communities and in effect, though not in order or title, bishop, primate and patriarch of that whole province of the Church Catholic. The system of Church government was not diocesan, and though there were bishops in Scotia they appear to have simply exercised their spiritual and sacramental powers in conferring orders and performing other rites. The government of the Celtic Church appears to have been administered only by the arch-abbot and his subject abbots. The Church spread, not by the erection of parishes, but by the planting of monastic houses, and a monastic community usually consisted of members of a clan, thus of kinsmen one of another. Columba himself had among 11 successors in the primacy 9 who were his kinsmen. These Gaelic monks lived under a rule drawn up for them by men of their own race, but in imitation of the early rules of the eastern cenobites. The chief precepts of the Celtic monastic rule were poverty, chastity, obedience, and hospitality. The day of Easter was observed according to the Eastern cycle, and in this the Celtic Church of Scotland was at variance with the Latin Church. They had also some peculiarities in the mode of administering baptism. Columcille came among the Scots in 563, being then aged about 40; he lived till the close of the century. From the end of the 6th to the end of the 8th century Hy-Columcille or

Iona was one of the most famous sanctuaries of western Christendom; the Norse pirates laid Iona waste with fire and sword in 795; again in 802; and the ravages were repeated often afterward. Toward the end of the 11th century Margaret, queen of King Malcolm Canmore, introduced into the Celtic Church of Scotland the usages of the Church of Canterbury in the observance of Lent and of Easter, in the celebration of the mass and other points of ritual; also she procured to be forbidden marriages between persons related by affinity. In these reforms she was aided by Lanfranc, Archbishop of Canterbury. The only monument of the ancient Celtic Church still extant in Scotland is (the insignificant ruins in some of the Hebrides not reckoned) the chapel raised in memory of the good Queen Margaret on the castle rock in Edinburgh. See IONA.

Celtic Languages, The. These constitute one of the seven or eight main groups comprised in the great family of Aryan or Indo-European languages: thus the Celtic is a sister language of Sanskrit, Old Persian, Armenian, Slavonic, Lithuanian, etc., as well of the Latin, Greek, Teutonic, and of the dominant modern languages of Europe. Within historic times Celtic speech prevailed throughout western Europe. As late as Caesar's time it was the language of northern Italy, then known to the Romans as Gallia Cisalpina or the land of the Gael south of the Alps; and at that time Celts, Gaels or Gauls occupied the whole of the region lying west of the Rhine and part of Switzerland, besides the British Isles. But in time Celtic speech was wholly detruded from its seats throughout western continental Europe except the western extremity of France, and in the British Isles at the time of the Norman conquest it had disappeared from the whole southern half of Britain except Wales and Cornwall, and survived only in northern Britain, Ireland, Man and other isles of the Britannic group.

The language of these Celtic peoples, as well in antiquity as at the present time, presented dialectic differences sufficient to warrant a division of their common speech into two groups, the Gaelic, now represented by the Celtic speech of Ireland, Scotland, and Man; and the Cymric or Kymric, represented by the Celtic speech of Wales and Brittany. Of these two groups the Cymric has best withstood the intrusion of alien speech, whether Romanic or Teutonic; and to this day a Cymric dialect of Celtic is the language of the people of Brittany and Wales; while of the provinces of the Gaelic tongue, Scotland, with a population of about 4,500,000, has not in the mainland or in the isles more than 300,000 persons who speak or understand Gaelic; and in Ireland in 1900, when the population was 4,500,000, the speakers of Gaelic were but 700,000, a decline of 50,000 from their number 10 years before. This decline is due to the large emigration in the last few years from the western province, the last foothold of Gaelic in Ireland. But the people of Ireland and the children of Ireland abroad are now making a concerted effort to resuscitate the ancient speech of their race and to make it again the home-speech of the people, concurrently with English. High hopes are entertained of the success of this movement, which purposes a revival, not only of the Gaelic speech but of Celtic art, and music,

CELTIC LANGUAGES

and literature. It is a struggle for the supremacy of Gaelic ideals in the spiritual life of the people. In 1902, in a convention of the Gaelic League in Dublin, 475 branches of the League were represented. The membership of the branches amounted to 50,000. Gaelic is now taught in 1,600 schools in Ireland, and there were that year several Gaelic periodicals, and nearly every newspaper in Ireland had a column or a page printed in Gaelic. There were 600 Gaelic literary and musical compositions entered in a prize competition held at Dublin during the convention, to which resorted thousands of visitors from all parts of Ireland and from abroad. Such competitions have long been held by the Cymry of Wales.

The Celtic speech of the Britons, now represented only by the Cymric of the Welsh, was formerly the language of the inhabitants of Cornwall and of Strathclyde also, and it is closely akin to the Armoric, or language of Brittany. In the last quarter of the 18th century died the last person for whom the Celtic speech of Cornwall—the Cornish—was a living language. Very scanty remains exist of the poetry of the Celtic inhabitants of Cornwall. What treasure of poetical compositions or of mythic history may have been held in the memory of their bards or of the people is lost, with the exception of five or six poems in the vein of the mysteries of mediæval times, namely: The 'Poem of the Passion,' a versified account of the life of Jesus Christ in the "holy week"—it is probably of the 7th century; 'Ordinalia,' a dramatic trilogy, the first member of which recounts man's history from the creation to the deluge, and then presents the story of Moses, of David, and of the temple of Solomon. The poet or dramatist has no regard for chronology, and makes the temple the theatre of the martyrdom of the Christian virgin Maximilla by the bishop in charge. The second member of the trilogy represents the life of Christ from the temptation by the devil to the crucifixion. The third is a free version of the story of the resurrection and ascension of the Lord, with a supplementary act representing the death of Pilate as told in mediæval legends. Dramatic unity is obtained by interweaving a myth regarding the wood of the cross, a favorite extravaganza of mediæval fancy. Another play is 'The Life of Saint Meriasek' written in 1504, a jumble of historical and traditional personages and occurrences crowded together with no regard whatever to chronology or probability or even possibility. But in the tangle are found some passages of considerable literary merit. Besides these dramatic pieces there survive a few songs, proverbs, epigrams, and the like, and the tale of 'John of Chy-an-Hur,' a favorite folk-tale.

Welsh, or Cymric (Kymric), the language of the Cymry or Kymry, is both a living language and has a literature of considerable volume and of no mean literary value. A few of the peculiarities of Cymry speech which distinguish it from the kindred speech of the Gæl, as regards the phonology, are that in Welsh *p* (labial) answers to *c* (*c* hard, equal to *k*) in Gaelic; *c.g.*, Welsh *prén*, tree, *petguar*, four, *plant*, progeny, answer to Gaelic *crann*, *cethir*, *cland*, respectively; or, Welsh *nep*, map, *paup* to Gaelic *nech*, person, *mac*, son, *cach*, each, respectively. Even proper names from Gaelic sometimes undergo this change on coming into Cymry speech: *e.g.*, the

celebrated Irish saint, Kiaran (Ciaran, the *c* being always equal to *k*) is in Cymric Piaran; but conversely the word *Pasch* (Pascha, pass-over) is in Gaelic *casg*, and Latin *purpura*, allied to Gr. *pur* or *pur* and to Eng. *fire*, is in Gaelic *corcur*. Answering to Gaelic *iasg*, which is Gr. *ichthys* and Eng. *fish*, Welsh has *pysg*, as Latin has *piscis* (*c=k*). In Cymry the sibilant *s*, preserved in Gaelic, Latin, etc., is often displaced by *h*, as is the case in Greek also, *c.g.*, Eng. *salt*, Lat. *sal*, Gæl., *salann*, but Welsh *halen*, Gr. *hals*. Other differences of this sort between Welsh and the sister language Gaelic might be instanced, but these suffice.

Many Welsh MSS. from early times are extant—poems and prose romances chiefly, and they relate to the period of the Roman occupation, of the wars with the Sassenach, and the wars with the kindred Gæl, or they are collections of proverbs or are religious poems. Probably the most ancient of these compositions do not date from an earlier period than the 13th century, though doubtless they are based on and inspired by bardic and other pieces retained through generations in folk-lore. Among the Cymry, as among the Irish Gæl, the bardic order was recognized as a sort of priesthood and was held in the highest respect, the bard enjoying many special privileges. Thus, in the Laws of Howel Dda (Howel the Good), composed in metre according to primitive usage in all lands, the provisions made for the bard are thus expressed:

In case of fighting the Bard shall play the
'Monarchy of Britain' before the battle.
His land shall be free, he shall have a horse
from the King.
He shall have a harp from the King and a gold
ring from the Queen. The harp he shall
never part with.

Most of the ancient poetry is attributed to the bards Taliessin, Aneurin, Llwywarch, Hen, and Myrddin (or Merlin).

For many hundred years the Cymry in Britain were engaged in a deadly struggle with invading races—the Romans, the Gæl, both Scots and Irish, the Sassenach, the Normans, and the English, being pressed back to the West till finally they were conquered and "pacated" in the time of Henry VII. All this time the Cymry bards and chiefs and people kept alive the lamp of learning and cherished the highly imaginative poetry of their seers; and it is a curious fact that among the remains of their early literature still extant are no fewer than 30 treatises on Cymry grammar and prosody, the most notable of these dating from about 880. It was revised in 1200. The authorship of most of the ancient books as well as the dates are problematical, but the dates assigned by the general consent of Welsh scholars to the principal poets are: Aneurin, 510-60; Taliessin, 520-70; Myrddin or Merlin, 530-600. Some of the poems attributed to these three and others are undoubtedly spurious, and so proved to be on chronological grounds. Thus, though the three poets named lived *ex hypothesi* not later than the beginning of the 7th century, in the works attributed to them are found allusions to theological conceptions and use of theological terms which were unknown till four or five centuries later. The Bible was translated into Welsh in the 16th century by Bishop Morgan, and that was doubtless a powerful agent in preserving in its purity

among the common people their ancient mother tongue.

The Gaelic speech of Ireland and Scotland has a very peculiar phonology, specially in the "aspiration" and "eclipsing" of consonants. This aspiration, as defined by O'Donovan, is "the changing of the radical sounds of the consonants, from being stops of the breath to a sibilance, or from a stronger to a weaker sibilance." But however correct that definition may be, it gives not to one who has no acquaintance with Gaelic any conception of the effect of what is here called aspiration. A few examples will better show what this peculiarity of Gaelic speech is. In Irish Gaelic, and in Scots Gaelic also, though perhaps some differences exist between the two dialects in this respect, the consonants that are subject to this phonetic change are *b*, *c* (*always* = *k* except when "aspirated"), *d*, *f*, *g* (*always* hard with the same exception), *m*, *p*, *s*, and *t*. The aspiration is denoted, whether in MS. or in print, by a point over the letter, *e.g.*, *ċ*, or by a *h* after, *e.g.*, *mh*. The effect of aspiration is to change the *b* and also the *m* (*bh*, *mh*) to *v* or *w*, or to a sound between *v* and *m*; example, *ard*, high and *bearna*, gap, give not *ard-bearna* (*ardbarna*), but *ardbhearn* (*Ardvarna*). Similarly *Baile-an-mullaich*, the *m* being changed to *mh*, with the sound of *w* becomes in pronunciation *Ballinwoolly*: the word is the name of a town and is made up of *baile*, town, *an*, of the, and *mullaigh*, possessive case of *mullach*, summit. The aspirated *d* and *g* are in sound about equivalent to *y* in *year*; example: *Annayalla* fairly well represents the pronunciation of *Eanaigh-gheala*. When aspirated, *f* is not sounded at all; example: *Cnoc-an-fhlaioigh*, pronounced *Knocanrec*. *P* aspirated is equal to *f*: *baile-an-phoill*, pronunciation, *Ballinfoy*. The *s* and *t* aspirated are equal to *h*; example: *drum-shamhuin* is *Drumhawan*, and *Drumhirk* fairly represents the pronunciation of *drumthuir*. To illustrate the process of eclipsis, "suppression of the sounds of certain radical consonants by prefixing others of the same organ"—a process to which are subject the consonants *b*, *c*, *d*, *f*, *g*, *p*, *s*, *t*, each of which has a special eclipsing letter of its own, one illustration, the eclipsing of *b* by *m*, must suffice: the place-name *mullanamoya* (or as it is written, *Mullaghnamoyagh*) represents *Mullach-na-mboitheach*: here the representation of the sound of the word in English is almost as cumbersome as in the Gaelic.

Nearly all the remains of ancient Gaelic literature, and they are comparatively very voluminous and intrinsically valuable, are of Irish origin, the documents written in the Scots and the Manse dialect being of little or no importance. There exists no evidence that in the Middle Ages there were anywhere, in Scotland, schools or academies or any body of scholars, bards or legists such as existed in Ireland as early as the 6th century; and no document in Gaelic or in Latin, and of Scotch origin has come down to us of earlier date than the 'Book of Deer,' which appears to have been penned in the 9th century, and which contains only "a few notes or memorials" in Gaelic, while the body of the book is in Latin containing the gospels in Jerome's version. The Gaelic poetry of Scotland, as preserved in the memory of the people of the highlands and collected in recent times are the only literary monuments extant of ancient

Scotch bardism. The following verses are found in one of those collections. They show the "aspiration" of consonants as in the Gaelic of Ireland.

Tamhull mòr, mac sheann Tamhuil,
(Great Taval, son of old Taval)
Cha ruigeadh a'mhuir mhòr a ruine,
(The great sea wouldn't reach his middle)
Cha thàruidh e mach, 's cha thàradh e steach,
(He couldn't get out and he couldn't get in.)
'Us 'n uair a bhitheadh e 's a bheul fodha,
(And when he lay down on his face)
Bhitheadh a dhruim a' sgrìobadh an athar.
(His back would be scratching the sky).

There are extant fragments of Gaelic writing penned in the 8th and 9th centuries, namely Gaelic glosses appended to Latin MSS. Among these the canons of an Irish synod held in 684 and some passages from a sermon in Gaelic. In libraries in many continental European countries are many Gaelic texts of early times; but in the library of Trinity College, Dublin, and in that of the Royal Irish Academy, in the Bodleian at Oxford, and in the British Museum, are treasured monuments of a very copious Irish Gaelic literature, by good fortune rescued from the destruction which has overtaken the great mass of Ireland's literary product during the "dark ages" of European history. According to their contents these MSS. are classed as histories, annals, biographies, pedigrees, mythological stories, fairy tales, hero stories, religious and devotional writings, lives of saints, lyric poetry, satire, many of the hero tales and myths being in poetical form. Treatises on law (*Brehon law*) are numerous and there are also medical treatises and some works on natural science. As among the Cymry, so among the Irish Gæl, the bards and the possessors or professors of the liberal arts and of the *arcana* of science human and divine, were a privileged class. As early as the 6th century the liberal professions were well organized, and the schools of Ireland were already sending out graduates of *Ecna*, *Filidecht*, and *Fenechas*, wisdom (or philosophy), poetry and divination—the schools of the *Filidecht* were "schools of the prophets"—and law.

Ireland became in the darkest of the Dark Ages, the 9th, 10th, and 11th centuries the sanctuary of learning, and to her schools students flocked in thousands from Gaelic and Saxon Britain and from the continent, while Irish missionaries carried abroad to the banks of the Rhine, the Elbe, and the Danube, and to the Swiss in their mountains, with the cross, the lamp of learning. The profession of a *Fili* being a highly privileged one, and the *Fili* being numbered by thousands, the poetical and imaginative literature of Ireland was exceedingly voluminous, and though most of it has perished, a very considerable portion remains. Of special value are the numerous glossaries, which have been the means, in the hands of modern scholars, of reconstructing the vocabulary of the language. It is estimated that were the words of all the glossaries collected they would add 30,000 to the words contained in the printed dictionaries of the language. In one of these glossaries, dating from before the year 903, is seen an essay in comparative linguistic, Gaelic words being traced in their relations to the Greek, Latin and Hebrew, the British and the Norse. Very numerous are the remains of Gaelic historical or annalistic writings, and of biography, especially lives of saints: there are the annals

CELTIC LITERATURE — CELTS

compiled before 1088 by an Abbot of Clonmacnoise; the so-called 'Annals of Ulster,' collected toward the end of the 15th century; the 'Annals of the Four Masters,' a compilation made indeed as late as the first half of the 17th century, but which embodies a great number of annals dating from much earlier periods, and which are now lost. The hero-tales relate mostly to the earliest period of which the memory was retained in the traditions of the Gaelic race — the times of the invasion of Cymric Britain and of Caledonia by the Gael of Eire or Erin, or to the wars at home with the tribes known as Nemed's people (Nemesians), Fomorians, Firbolgs, Tuatha, DéDanann, all of them rivals of the Milesian Gael. To the legendary story of these wars belong the mythic heroes Finn MacCumhail (son of Cumhall); Finn's son Oisín (the Ossian of Scots Gaelic, as he is also of Irish Gaelic myth); Niall of the Nine Hostages, a figure that stands upon or within the threshold of veridical history; he met his end in an invasion of Cymric Britain in 405. Of other extant poetical compositions founded on the legendary or the real history of the times between the 5th and 11th centuries are: A metrical life of St. Patrick by Fiacc, a bishop; an elegy on the death of the renowned St. Columcille or Columkill, apostle of the western Scots (d. 597); the antiquity of this elegy, the extant copy of which was made about 1100, is proved by the fact that its language was in the 11th century so obsolete that it had then to be glossed and accompanied by grammatical notes. Of this class of legendary or historical poems there is a long list. Prose romances of history came into vogue in the 11th century: in these are glorified the deeds of the Gaelic heroes of the long struggle with the Danes or Norsemen who for 200 years had been making settlements on all the coasts of Ireland; in them was chiefly celebrated the battle of Clontarf, 23 April 1014, in which a great and decisive victory was won by King Brian Boróihne (pronounced boróih) — Brian of the cow tribute. There are in collections of Gaelic MSS. treatises on the medical art — an art which appears to have been hereditary, in certain families, who assumed as surname a word denoting the art or its professors, for example, O'Liagh (pronounced oléah), equivalent to leechson or descendant of the leech; O'Hiceadha, O'Hickey, descendant of the healer. Treatises on the Brehon law or Gaelic system of jurisprudence are numerous, the MSS. dating from the 14th and 15th centuries.

Celtic Peoples. See CELTS.

Celtis, a genus of trees of the natural order *Urticaceæ*, closely related to the elm. *C. australis* is the nettle-tree. See NETTLE-TREE.

Celts, or **Kelts**, the earliest Aryan settlers in Europe according to the common theory. They appear to have been driven westward by succeeding waves of Teutons, Slavonians, and others, but there are no means of fixing the periods at which any of these movements took place. Herodotus mentions them as mixing with the Iberians of Spain. (See CELTIBERI.) At the beginning of the historic period they were the predominant race in Britain, Ireland, France, Belgium, Switzerland, north Italy, Spain, and elsewhere. The Romans generally called them

Galli, but also *Celtæ*. They appear to have reached the zenith of their power in the 2d and 3d centuries B.C. Some tribes of them, overrunning Greece, crossed over in 278 B.C. to Asia Minor, and subsequently the name of Galatia was given to the country where they settled, from their name in Greek — *Galatai* (*Keltai* being also used). They finally went down before the resistless power of Rome, and either became absorbed with the conquering races or were cooped up in the remotest parts of their former domains. At an early date the Celts divided into two great branches, speaking different though allied languages. One of these branches is the Gadhelic, Goidelic, or Gaelic, represented by the Highlanders of Scotland, the Celtic Irish, and the Manx of the Isle of Man; the other is the Brythonic or Cymric, represented by the Welsh, the Cornish, and the inhabitants of Brittany. The Cornish dialect is now extinct. The sun seems to have been the principal object of worship among the Celts, and groves of oak and the remarkable circles of stone, commonly called "Druidical Circles," their temples of worship. Celtic art is known to us chiefly in the many ornamented articles in bronze and other metals which have been preserved, and in several splendidly illuminated manuscripts of the gospels. The earlier specimens are characterized, among other things, by a predominance of elliptic curves and diverging spirals, and their style seems to have been of purely British origin and use. The introduction of Christianity led to a great advance in the ornamentation of metal and other articles, but the chief relics of Christian Celtic art are the magnificent manuscripts above referred to. Their dates range from the 7th to the 9th century, and the finest of them are the 'Book of Kells' (Trinity College, Dublin) and the 'Lindisfarne Gospels' (British Museum). See also ETHNOLOGY; GAEL; GAUL; IRELAND; PHILOLOGY; SCOTLAND; WALES.

Bibliography — Logan, 'The Scottish Gael' (1855); Pritchard, 'Eastern Origin of the Celtic Nations' (1857); Thébaud, 'The Irish Race' (1873); Beddoe, 'Races of Britain' (1885); Roemer, 'Origins of the English People' (1887); Brinton, 'Races and Peoples' (1890); Ripley, 'Races of Europe' (1890); Rhys and Jones, 'The Welsh People' (1900); Deniker, 'The Races of Man' (1900).

Celts, *sélts*, ancient weapons or implements of stone or bronze, found over nearly the whole surface of the earth. The derivation of the word is uncertain, though a very likely origin is to be found in the Welsh *cellt*, meaning "flint." There seems to be no reason whatever to connect the word with the name of the Celtic people. Stone celts are popularly believed in many countries to be thunder-bolts. Hence in different parts of Great Britain they are known as "thunder-axes," "thunder-bolts," etc.; and they are still, or have been known by similar names in France, Germany, Italy, Denmark, Greece, Japan, Burma, and numerous other places. Even the learned did not refuse their countenance to this vulgar error. Connected with this curious belief as to the origin of these stones, there were various superstitions almost equally widespread, such as those regarding their efficacy against lightning and their medicinal virtues. Somewhat similar beliefs were connected with the equally common

CEMBRA NUT — CEMENT

flint arrow-heads. Stone celts are found in the form of hatchets, adzes, or chisels. Some are only about an inch in length, while others approach two feet. The most common length is from six to eight inches, and the breadth is usually about one half or one third of the length. The materials of which they are made are flint, chert, clay-slate, porphyry, various kinds of greenstone and of metamorphic rocks, and, in short, any very hard and durable stone. Some are found merely chipped into shape; others have the edge ground and polished, although the other parts are merely chipped; and there are others which have the whole surface ground and polished. These stone celts belong to the Stone Age of archaeologists, the ruder class being regarded as taking their origin in the earlier or Palaeolithic Period, the more perfect in the later or Neolithic Period; while the bronze celts belong to the much more recent Bronze Age. Celts that are merely chipped appear to be more common in flint than in any other material. Two good reasons are given for this: first, that most other stones are more easy to grind than flint, and second, that it is more easy to give the proper form to flint than to almost any other stone merely by chipping.

There were two chief methods by which stone celts were attached to their handles. One was to insert the celt tightly in a hole made in the handle. The other was to insert the handle in a hole in the celt. Celts which have such holes to admit the handle are called perforated celts, and many axe- and hammer-heads have been found of this form. Sometimes, instead of a hole being cut right through the handle for the admission of the stone, there was merely a socket made in the wood, in which the celt was firmly fastened by means of some kind of binding. Instead of wooden handles, stags' horns seem often to have been used, and such are sometimes found with sockets at the end, evidently intended for the reception of small celts.

At various places remains have been discovered which indicate pretty clearly that at these spots the manufacture of celts was anciently carried on. Evidences of the existence of such manufactories are to be seen in the neighborhood of the Pfahlbauten of Moosseedorf in Switzerland; at the confluence of the Leochel and the Don in Aberdeenshire; at Cissbury, near Worthing; at Grime's Graves, near Brandon; at Spiennes, near Mons, in Belgium, and many other places. At the last-mentioned place the manufacture was carried on on a very large scale, and the shafts and galleries which were excavated in order to procure the flint necessary for the manufacture are still to be seen. Sometimes, however, the manufacture was carried on at places where the flint or other material out of which the celts were made was not to be had; such, for example, as the one mentioned in Aberdeenshire, and this proves flint to have been among the earliest articles of commerce. The blocks of flint were evidently imported as raw material to those manufactories, and then exported again in the form of manufactured celts. The remains found at these ancient manufactories leave little doubt that the process of manufacture must have been much the same as that by which gun-flints are still manufactured.

Bronze celts belong to a later period than stone ones, and are not so numerous. Some

stone celts, however, have been found along with bronze celts in such a manner as to show that stone celts were still used when the method of working bronze had been discovered, a circumstance that need not be wondered at. Bronze celts are not found so large as the largest stone celts, the largest bronze celt being under 12 inches, but the average size of a bronze celt is about the same as that of a stone.

Stone celts are also found in various parts of the United States, flint and obsidian being largely used in the manufacture of cutting instruments. (See MOUND-BUILDERS.) On the subject of stone celts, consult Evans, 'Ancient Stone Implements of Great Britain.'

Cembra Pine, a fine conifer (*Pinus cembra*) of central Europe and Siberia, having edible seeds and yielding a turpentine called Carpathian balsam. "Swiss stone pine" and "Siberian pine" are variant names. The fruit is known as "cembra nuts."

Cement. A cement is any compound which, under certain conditions, is plastic and under others develops tenacity and can be used for holding together various materials; hence glue, lime, asphaltum, mucilage, and solder are cements. By far the most important class of cements structurally and commercially are the **hydraulic cements**, mixtures of lime, silica, and alumina that have the property when mixed with water to a paste of cohering or setting and finally becoming stone hard, even under water. The hydraulic cements may be divided into four classes based on differences in the materials used. The setting is probably due to the same general chemical reactions in all hydraulic cements, the lime uniting with the alumina and silica to form hydrous calcium silicates and aluminates. The quickness with which these reactions take place vary, the composition of the original materials and the differences in the methods of manufacture being the controlling factors. **Quick-setting cements** may become hard in a few hours, while some slow-setting cements require many months to reach their maximum tenacity.

The four classes of hydraulic building material above mentioned are (1) *Hydraulic lime* made from a limestone containing a small proportion of clay (8 to 10 per cent) by burning at a low temperature and slaking the burned rock with water. (2) *Hydraulic or natural-rock cement* made from a limestone containing a relatively high proportion of clay, by burning at a low heat and grinding the product to powder. (3) *Portland cement* made from an artificial mixture of carbonate of lime (either chalk, ground limestone, or marl), with a certain proportion of clay, burning at a white heat and grinding the clinker to powder. (4) *Pozzuolana or slag cement* made by mixing finely-ground scoria (volcanic ash) or some kinds of blast-furnace slag with a small proportion of slaked lime. Of these the second and particularly the third are of chief importance in this country though the manufacture of slag cement is a promising industry.

The manufacture of hydraulic lime though carried on to a considerable extent in France, has never been established in this country probably owing to the abundance of excellent cement-rock in New York, Pennsylvania, and other

CEMENT

states. Hydraulic lime is light and bulky compared with the other cements. It requires from one to several days to set and hardens slowly, but some grades resist the continued action of sea water even better than Portland cement.

Natural-rock cement.—This material also known as common cement, hydraulic cement, Rosendale cement, and quick-setting cement, is manufactured in great quantities in some parts of the United States. It is made on a considerable scale in France, but the German and English output has been insignificant for some years. In the United States the material used is limestone or marl often containing over 23 per cent of clay and the limestone is generally dolomitic, that is, contains carbonate of magnesium. In Europe magnesian limestones are seldom used. The cement rock is quarried, broken, and burnt in continuous kilns, much as limestone in the manufacture of ordinary lime. The burnt rock is a mass of partly vitrified clinker not affected by water. It is ground in mills of several types. Formerly all plants used millstones, and the light yellowish or brownish powder fine enough to pass a 50-mesh screen, is sent to market in barrels containing about 300 pounds, or in sacks. When mixed with water this cement sets in a few minutes and hardens gradually. It is cheap and when mixed with one part of sand by weight is used for mortar or concrete and for cistern and reservoir linings. It has not the great tensile strength of Portland cement, hardens slower and more imperfectly.

The composition of Rosendale cement rock and natural hydraulic cement is as follows:

Carbonate of lime	45.91
Carbonate of magnesia	26.14
Silica and insoluble	15.37
Sesquioxide of iron	11.48
Alumina	1.20
Water and undetermined	1.20
Totals	100.00
Silica	22.75
Alumina and iron sesquioxide	16.70
Lime	37.60
Magnesia	37.60
Alkalies	16.68
Carbonic acid	5.00
Sulphate of lime	1.30
Water	1.30
Totals	100.00

The chief center of the industry in this country is the Rosendale district of Ulster County, New York, where the rock quarried is a limestone of the lower Helderberg series. It is also made in Pennsylvania, the Louisville region of Kentucky and Indiana, at several points in Illinois and around Milwaukee, Wis. The outputs in 1902 were: New York, 2,234,137 barrels; Indiana and Kentucky, 2,150,000; Pennsylvania, 942,384; Wisconsin, 481,020 barrels.

Portland cement.—This material was first made in England in 1824. The name is taken from the resemblance of the mortar to the oolitic limestone of Portland island in the English channel. The industry was later taken up in Germany. In both countries the industry grew enormously and the output now amounts to over 20,000 barrels yearly in Germany, and to nearly 9,000,000 barrels in England. Portland cement was first made in the United States at Coplay, Pa., in 1878, and since then works have been established in at least fourteen other

states. The growth of the industry is perhaps the most marvellous thing in the whole history of the industrial development of this country. No farther back than 1894 the total annual product was small. Since then the output has increased enormously, over 100 per cent in a single year, and the annual product exceeds England's.

The composition of some Portland cement materials and Portland cements is shown by the following tables:

	Coplay, Pa. natural rock and lime- stone		Montezuma, N. Y., clay and marl		Santa Cruz, Cal., clay and coral rock		Philippine, N. Y., natural rock only
	Cement rock	Lime- stone	Clay	Marl	Clay	Coral- lime	Cement rock

In 1891 but 13.2 per cent of the product used in this country was of domestic manufacture, in 1900, notwithstanding the great increase in consumption, due to the growth of the building industry from 1895 to 1900, the domestic manufacturer furnished 80 per cent of the material used. To-day the best grades of American Portland cement are as good as those produced anywhere, and in effectiveness of equipment, large output, and cheapness of production, the leading Portland cement plants of this country are models for the world. Not even in the development of our iron and steel industry have American energy, resourcefulness and mechanical, been more strikingly displayed. In making Portland cement, two processes are used, the wet and the dry. In the wet process marls and clays are used; in the dry process natural cement rock. The wet process plants are mostly in the marl section of Ohio, Indiana, and Michigan; the dry plants in the limestone

CEMENTATION PROCESS—CENCI

and shale regions of Indiana, Missouri, Virginia, eastern Pennsylvania, and western New Jersey. It is in the Lehigh section of Pennsylvania that the best features of American practice have developed. The stone is quarried by the use of air-drills and high explosives, at a cost of 18 to 50 cents per ton; the shale and limestone broken in large gyratory crushers, thoroughly dried in mechanical drier, finely ground in ball or tube mills or in mills of the centrifugal type and burnt to a clinker in cylindrical rotary kilns. The clinker is cooled in cooling towers and ground or stored for a few days and then ground to a fine powder in ball, tube, or centrifugal mills. For burning the clinker coal dust is generally used as fuel. The finely-ground clinker is packed in barrels holding 400 pounds each, or in sacks, for market. In the wet process the methods used differ only up to the burning of the clinker, and the differences are due to the nature of the materials, the clay and marl being ground together wet. But 15 per cent of the United States product is made in the wet way. The chief producing states in 1902 were: Pennsylvania, 8,000,000 barrels; Michigan, 2,400,000 barrels; New Jersey, 1,900,000 barrels; New York, 990,000 barrels; Illinois, 900,000 barrels.

The following table shows the production of natural hydraulic and Portland cement; the imports, exports, and domestic consumption, the figures being taken from 'The Mineral Industry.'

YEAR	Production			Imports		Exports		Consumption	
	Natural hydraulic	Portland and slag cement	Total barrels	Value	Value	Value	Value		
1885..	4,000,000	150,000	4,150,000	\$3,492,500	\$840,191	\$13,555
1890..	7,664,500	335,500	8,000,000	6,000,000	3,175,159	134,295
1895..	750,000
1900..	9,177,222	11,309,052	20,486,274	15,393,109	3,330,445	289,186	23,481,933	18,434,368
1902..	9,083,759	17,082,175	26,165,934	22,023,248	2,581,883	575,268	28,402,466	24,429,863

Slag cement—The ancient Romans used volcanic scoria or "pozzuolana" mixed with slaked lime to make a cement, the durability of which

is attested by the solid masonry of many ruins. Within recent years it has been found that certain kinds of furnace slag, especially those from the manufacture of steel by the basic process, can give hydraulic properties to common lime. The mixture forms a slow-setting and slow-hardening cement that in time develops great strength. Though condemned by manufacturers of Portland cement, the product is gaining ground and the tonnage annually produced in Germany is considerable. In this the industry did not exist until 1895. Now there are large works making slag cement at Chicago, Ill., near Birmingham, Ala., at Jersey City, N. J., and elsewhere. A plant at Sharon, Pa., uses slag having the following composition: Silica, 32.72 per cent; alumina, 12.95 per cent; iron, 2.52 per cent; lime, 47.67 per cent; magnesia, 2.71 per cent; sulphur, 1.44 per cent. This slag as it comes from the furnace is granulated by contact with water and then dried. The lime is burnt, slaked, and mixed with the slag by mechanical mixers. The mixture is finely ground in tube mills. The resulting cement has this composition: Silica, 27.33 per cent; alumina, 11.61 per cent; iron, 2.43 per cent; lime, 55.83 per cent; magnesia, 1.93 per cent; sulphur, .87 per cent. The total production of slag cement in the United States in 1902 was 109,435 short tons, valued at \$465,100. There are at least seven plants making it, two being in Alabama.

The use of cement, particularly in concrete construction, is increasing rapidly and bids fair to grow with the decrease of our forests.

Cenci, **Beatrice**, bā-à-trē'chē chēn'chē, Italian lady, the cause of the extermination of the noble family of Cenci. Muratori, in his 'Annals' (Vol. X., part 1, 136), relates the story as follows: Francesco Cenci, a noble and wealthy Roman, after his second marriage, behaved toward the children of his first marriage in the most shocking manner, procured the assassination of two of his sons, on their return from Spain, by banditti, seduced and debauched his youngest daughter Beatrice, a maiden of singular beauty. She discovered this shocking crime to her relatives, and even sought to obtain protection from Pope Clement VIII. It appears, however, that this was not granted: for, when the guilty father continued his former treatment with aggravated wickedness, she joined with her brother Giacomo, and hired two assassins, who put the monster to death as he slept. The guilty parties were discovered, confessed the murder on the rack, and were condemned by the Pope

to be torn to pieces by horses. In vain did the learned Farinaceus exert himself to obtain a mitigation of their punishment by a lively representation of the depravity of the deceased, 9 Sept. 1598. According to other accounts, Beatrice and her relatives appear to have had little or no share in the murder of the old Cenci; but a tissue of villany and baseness gained belief to the false testimony of two banditti against the Cenci family. So much is certain, that, 11 Sept. 1599, Beatrice Cenci and her stepmother were executed with a sort of guillotine called mannaia. Giacomo was killed with a club; the younger brother was pardoned on account of his youth; but the estates of the family, to which belonged the Villa Borghese, were confiscated, and in 1605 presented by the reigning Pope, Paul V., of the house of Borghese, to his family. In the Barberini Palace at Rome, travelers are shown an excellent painting, said to be by Guido Reni, as the portrait of the unfortunate parricide; but this is now controverted, and recent investigations tend to show that the popular version of the whole story is far from the true one. Shelley has made the Cenci the subject of a drama. See Bertolotti, 'Francesco Cenci e la sua Famiglia' (1877).

Ceneda, chā-nā'da. See VITTORIO.

Cenis, sē-nē'. **Mont**, a mountain belonging to the Graian Alps, between Savoy and Piedmont, 11,755 feet high. It is famous for the winding road constructed by Napoleon I., which leads over it from France to Italy, and for an immense railway tunnel, which required nearly 14 years' labor. It superseded a grip railway which was constructed over the mountain by Mr. Fell, an English engineer in 1864-8. The tunnel does not actually pass through the mountain, but through the Col de Fréjus, about 15 miles to the southwest. The Mount Cenis Pass is 6,765 feet above the level of the sea, whereas the elevation of the entrance to the tunnel on the side of Savoy is only 3,801 feet, and that on the side of Piedmont 4,246 feet. The total length of the tunnel is 42,145 feet, or nearly 8 miles. For the sake of the drainage the bottom of the tunnel has a culminating point about the middle, and falls southward 128 feet, and northward 473 feet. The breadth of the tunnel at the base is about 25 feet, at the widest part about 26 feet; its height at the Modane end is 24 feet 7 inches; at the other end about a foot higher. The determination of the exact direction and height of the tunnel occupied a full year, and the work of piercing the tunnel was carried out with so much precision that the borers who had begun simultaneously from both ends met exactly. The tunnel is laid out for two lines of railway. The roof and walls are lined with masonry to the thickness of two feet seven inches, and where the ground is not very firm it is underarched. The boring was at first carried on by hand labor, and one eighth of the total length of the tunnel was finished in this way, but the rest was constructed by machines specially devised for the purpose. Each boring machine had 18 borers, by which holes about three feet in depth were wrought in the rock. For the blasting of every yard of the tunnel 97 borings on an average had to be made, and above 100 pounds of gunpowder were employed. The total cost of the tunnel amounted to \$12,636,000, which was borne partly by the

French and Italian governments and partly by the Northern Railway Company of Italy. The first mine of the tunnel on the Italian side was exploded by Victor Emmanuel at the end of August 1857; on Christmas Day, 1870, the workmen met in the middle of the tunnel; and on 17 Sept. 1871, the tunnel was officially opened.

Cen'obites (Gr. κοινος, common, βιος life), monks living in community with others, under a common rule instead of seeking the strict solitude of anchorites. The ascetics of the first ages, who dwell in the deserts together, were usually called by this name, the place in which they lived being called a *canobium*. Some writers refer the institution of these communities to the times of the apostles, others to St. Anthony (q.v.).

Ce'nogen'esis. While many animals during postembryonic growth pass through a series of stages which are similar to the ancestral forms of such types (palingenesis), in certain species development is direct. The different stages of growth or metamorphosis are crowded back to the embryo stage, or abbreviated, and the animals hatch or are born in the shape of their parents. This is called *cenogenesis*. Thus certain frogs, as a tree-toad of Guadeloupe, W. I., where there are no marshes, do not pass through a tadpole stage, but hatch without tails, and with legs, and otherwise resemble their parents. The same is the case with certain shrimps and crabs, and is partly the case with the lobster. In all such instances the direct development is apparently due to a difference in the environment, or other conditions of life, especially in certain crustacea, to a change from salt to fresh water.

Cenotaph, sēn'ō-tāf, a monument erected in honor of a deceased person, but not containing his body, as is implied from the derivation (Gr. κενός empty, and τάφος a tomb). They were often erected by the ancients, who believed that when the body was not buried the soul could not be admitted into the abodes of the blessed.

Cenozoic (sē-nō-zō'ik) **Era**, the last of the five great divisions commonly used in classifying geological time, and therefore including the present. As it is the last, its records are much more complete than those of the Mesozoic, but while more complete they are, perhaps, more perplexing. Of the older eras — as, for instance, the Palæozoic — much of the record left in the rocks has been obliterated, and thus only the traces of the greater changes in the distribution of land or water and of variations of climate have come down to us. Thus, while much is lost, the broader grouping of facts is easier. In the Cenozoic we have such a wealth of detail, such a great mass of evidence to sift and correlate, that geologists differ greatly as to how the record of the rocks shall be translated.

Generally speaking, the rocks of the Cenozoic Era are less compacted than those of the Mesozoic, being very often beds of loose sand or clay. They usually lie horizontal, though sometimes upturned in a great mountain range. Any particular series is seldom of wide extent, and different series tell widely different stories of climatic conditions. Thus, probably no series in the Cenozoic in North America is comparable with the coal-bearing formations of the Cretaceous.

CENSER—CENSORSHIP OF THE PRESS

As to the climate of the Cenozoic, it was at first remarkably mild and even, Spitzbergen and Greenland having as mild a climate as that of Ohio to-day. Gradually the climate became colder, resulting in the great continental glacier of the Ice Age. At a comparatively very recent date these glaciers receded, and the climate of the earth became substantially what it is to-day.

Cenozoic life is, on the whole, well differentiated from Mesozoic, particularly by the great development of mammals and, probably well along in its last half (reckoning by actual time), by the advent of man. As mammals have developed, so reptiles have declined, and to-day only snakes, crocodiles, lizards, and turtles represent the class; the great ichthyosaurs, plesiosaurs, dinosaurs, and pterosaurs were passing away by the end of the Cretaceous. In fact, as the Mesozoic was the era of reptiles, so is the Cenozoic the era of mammals. Among invertebrates many curious Mesozoic types have disappeared, but of the genera in existence early in the Cenozoic most still exist. This also is true of Cenozoic plant life.

As has been noted, geologists differ in their divisions and subdivisions of Cenozoic time. American geologists generally make two great divisions. Tertiary and Quaternary.

Cen'ser, a vessel in which incense is burned. Censers were employed by the Jewish priests for presenting incense to the Lord in the sanctuary. Josephus tells us that King Solomon made 20,000 gold censers for the temple of Jerusalem to offer perfumes in, and 50,000 others to carry fire in. Censers or thuribles are used in some modern churches, especially in the Roman Catholic Church at mass, vespers, and on other occasions. They are suspended by chains, by which they are swung about in the hand to spread the incense in all directions.

Cen'sors ("assessors"). In ancient Rome, originally two officers who rated the property of citizens in order to assess their taxes, on which all political rights were based; the community being graded by amount of income from estates. Being thus arbiters of the political and social position of every freeman, they speedily became the most important officials in the state except the occasional dictators. The supreme judicial functions, and the control of morals, fashion, and speech, which we associate with "censorship," flowed naturally from this. The essence of their duty being to fix the status of each citizen, they took cognizance of everything which bore upon it; and became arbiters of the sumptuary laws and customary observances which are the cement of early communities. Not only could they expel a senator from the senate and take his horse from a knight or even reduce him to the ranks for lack of property qualification, or notorious evil living, but they could punish for slack tillage, celibacy, demeaning occupations, extravagance, or any other conduct thought prejudicial to the common weal. There was an appeal to the popular assembly, however, and they had to state their charges publicly. The censors also filled vacancies in the senate, and appointed its

chief, originally at will, later according to a prescribed list. They let out the taxes to farm, took charge of public buildings, roads, aqueducts, etc. The term, legendarily five years at the outset, was a year and a half in historical times; originally patricians alone were eligible, but by fully historical times the plebeians had gained one censorship and occasionally secured both. The emperors assumed censorial power under the title "prefects of morals." The last who bore it was the brother of Constantine the Great.

In American history, the title was given to two sets of state officers in imitation of the Roman office. The 1776 Constitution of Pennsylvania provided that the people should elect a council of censors once in seven years, two for each city and county, to investigate the acts of the governmental departments, inquire whether or not the Constitution had been violated, etc. This curious article was dropped in the revised Constitution of 1790. But in Vermont a similar article had a far longer life, surviving until a comparatively recent time. That State in 1777 proclaimed its independence, and drew up a Constitution. One article, following the example of Pennsylvania, provided that on the last Wednesday of March in 1785, and the same day every seventh year thereafter, the people should choose a council of 13 censors, who should examine whether the Constitution had been preserved inviolate; whether the legislature had performed its duty as a guardian of the people, or had exceeded its powers; whether the taxes had been justly laid and collected, and how the public moneys had been expended; and whether the laws had been duly executed. They were also empowered, if they thought a change in the Constitution was needed, to call a convention to meet within two years thereafter, giving notice of the proposed change at least six months before the meeting. The last one so called, in 1870, abolished its creator; but the censorship seems to have worked fairly well for nearly a century.

Censorship of the Press, a regulation subjecting books, pamphlets, and newspapers to the examination of certain civil or ecclesiastical officers, who are empowered to authorize or forbid their publication. Such a regulation was suggested by Plato, and an informal censorship existed in the times of Greece and Rome. After the Roman Catholic Church acquired a share in the civil power it induced the state to condemn heretical books. Throughout the Middle Ages it sanctioned the principle that books objected to by its authorities should be suppressed. The invention of printing and the increasing number of books called forth new and stricter prescriptions of censorship, and there still remain copies of books printed in 1479 and 1480 which are accompanied with solemn approbations and attestations in their favor. Finally, in 1515, the Council of the Lateran, assembled at Rome, decreed that in future no books should be printed in any town or diocese unless they were previously inspected and carefully examined by the bishop of the diocese or his deputy, or by the inquisitor of the diocese or his deputy, or if at Rome by the Pope's vicar and the master of the sacred palace. Every work which was approved was to be countersigned by the hand of the censor, and any publication not thus coun-

tersigned was to be burned and its author or editor excommunicated. See INDEX.

In countries where the Reformation prevailed, the censorship was not abolished. Licensers of books were appointed in England, who were for the most part bishops. A general system of censorship was established by a decree of the Star Chamber, dated 11 July 1637, which was later confirmed by an act of Parliament. It was against this act that Milton wrote his great plea for freedom of the press, the 'Areopagitica,' but the censorship was not abolished until 1693.

Censorship of the press existed under the old French monarchy. It was abolished at the Revolution, but revived under Napoleon I. and again under Napoleon III. Except in Russia and Germany, where it is still in force, systematic censorship of the press may be said scarcely longer to be maintained in European Christian countries. In the United States there has never been such a censorship, although there are laws against publications of a scandalous character; there are various State laws against libel and a government censorship in the Philippines.

Censure, in canon law, a spiritual penalty whereby a contumacious offender is denied the use of certain spiritual goods. It has three degrees, excommunication, suspension, and interdict. By excommunication the offender is cut off from association with the faithful whether in spiritual things or in secular; by suspension a minister of the Church, a cleric, is deprived of the right to exercise the functions of his station; by interdict the services and ministrations of the Church are denied to an offender—the sacraments and the right to Christian burial. An interdict may affect places as well as persons, it may be laid on a church edifice or a burial place. Censures are the penalties prescribed in the Church's law for definite offenses, and some censures fall upon the offender, *ipso facto* or *ex ipso jure*, without need of a judgment being pronounced by Church authorities. Such a censure is said to be *lata sententia*, that is, providing for its own carrying out; but most censures are *ferenda sententia*, requiring that the sentence be pronounced by some proper authority, as the bishop of a diocese or his deputy. And absolution from some censures *lata sententia* is reserved to the supreme pontiff, while absolution of other censures can be given by bishops, or other pastors, either in the ordinary course of their jurisdiction or in virtue of special faculties accorded to them to that end. An example of a censure, release from which is reserved strictly to the supreme pontiff himself, is the censure of excommunication incurred by whoever violently assaults a cleric or a member of a religious order (*clericus vel monachus*); but an exception is made of the case where the offender is in danger of death.

Cen'sure, Congressional, of the President of the United States, a makeshift in lieu of an unattainable impeachment. There have been two cases of this, one by the Senate and one by the House. (1) During the long debate in the winter of 1833-4 over Jackson's cessation of deposits in the United States Bank, resolutions of censure were moved in the Senate; and after three months' wrangling over them and their form, it resolved 28 March 1834, 26 to 20, that

the President had arrogated authority "not conferred by the Constitution and laws, but in derogation of both." Jackson, by a special message 15 April, protested that this was a virtual impeachment of him as violating his oath of office, without giving him a chance to defend himself. The Senate majority (John Tyler being one) refused to receive or record the protest. Thomas H. Benton thereupon gave notice that he should move yearly to have the resolution expunged. It was objected that this contravened the Constitutional requirement to keep a journal, but Benton argued that the resolution was no part of legitimate legislative proceedings. On 16 Jan. 1837, the Jacksonians carried the curious compromise of having the resolution surrounded with black lines on the journal, and marked "Expunged by order of the Senate"; which of course left it intact, and merely recorded a change of feeling as to its justice. (2) To catch the Southern vote, the Democrat Tyler had been put on the ticket of the Whig Harrison in 1840; and on Harrison's death within a month of inauguration succeeded him as President. The Congress was Whig, and at its first session 1841-2, passed a tariff bill to distribute the surplus revenue among the States. Tyler vetoed it on the ground that the country had no business to raise taxes in excess of its needs, and that it was simply legalizing unjust burdens on the people. The Whigs had not a two-thirds majority to pass the bill over his veto, could not carry an impeachment, and in the House referred the veto message to a committee, which in its majority report censured Tyler for improper use of the veto. Tyler protested, and in reply the House sent him a copy of the Senate resolution he had voted for in Jackson's case.

Census. The utility to a government of knowing the extent of its resources in men and property is so obvious that some means of ascertaining it were probably employed early in history; but there is no record of it on the Egyptian or Assyrian inscriptions, and the Chinese accounts are dubious. The first we have reliable mention of is that of the Jews by David, including the males of 20 and over and the cattle; and the hatred and suspicion aroused by it are witnessed by the belief that God punished the whole people for the impiety. This apparently irrational feeling was universal in early times, has always been so in the East, and is by no means unknown elsewhere and later; its prevalence in 18th-century America, and even later in England, however, is probably due to misunderstood Bible teaching. The real reason was, that the early censuses had for an object not statistics, but taxation and conscription; and it was not to the advantage either of officials or people that the government should have too minute a knowledge of what could be extorted from them. Poverty and sparseness of population were too convenient excuses for not paying taxes or not remitting them to the capital. In the West, however, when constitutional government replaced autocracy, the census became a necessity for apportioning political rights and contributions; as in the Solonian constitution of Attica, where society was divided into four classes, with privileges graded according to income from landed estates. In Rome, whence the name "census" ("assessment") comes, it

CENSUS

was much the same; and as the enumerations were valued merely for the ratings deduced from them, not from any idea that statistics by themselves were of any value, they were discarded as soon as their use had passed, to the irremediable impoverishment of history. These censuses were taken at long and irregular periods, sometimes nearly half a century elapsing. But as the empire grew and the provinces were farmed by proconsuls, these found the same need of a thorough detail of their temporary estates, to know whether their sub-farmers were cheating them, that a capitalist does of his business; and each took a census (*professio*) of his own province on his own account, whose inquiries were sometimes almost as minute and exhaustive as those of the latest United States special census report on agriculture.

The mediæval censuses were of the roughest and far apart, and made only by a few enlightened rulers. Charlemagne attempted one for his dominion; and the Domesday Book of William the Conqueror in 1181 is familiar. This was a register of estates, with the heads responsible for feudal duties, their slaves and cattle—a census of the primitive type for the primitive objects.

The modern census, as a statistical review for its own sake, has a treble origin, in Sweden, England, and the United States. In 1686 the Swedish parish clergy were required to keep a record of births, marriages, and deaths, accessions and removals of inhabitants, unusual happenings, etc. Of course registration, which is a record of changes, is not a census, which is a statement of condition at a certain time; but with a given basis it can be turned into one. By request of the Swedish Academy of Sciences, in 1746, the clergy were directed to compile statistics of population, etc., for a quarter-century past; but these were kept rigidly confidential till 1762. At their publication Dr. Richard Price, the founder of scientific life-insurance calculation, based his first insurance tables on them. At first annual, then triennial, since 1775 they have been published once in five years. Meantime, in England, the London bills of mortality, first begun after the plague of 1592, had been recorded weekly since 1603, the year of James I.'s accession; and in the last half of the 17th century Sir Wm. Petty, the noted political economist, used them as a basis for very valuable and stimulating works on the extent and growth of population, human fecundity, effects of social and political causes, etc. Others took up the subject and made computations. In 1791 Sir John Sinclair undertook the most herculean statistical task ever attempted, perhaps, by a single man—to compile a census of the population, agriculture, trade, and industry of the entire kingdom, by inquiries sent to the clergy of the Established Church. He sent out schedules of 160 interrogatories, received over 900 replies, and in 1798 published 21 volumes of results. His work, and his exhortations made weighty by his work, induced Parliament in 1800 to establish a census office; the first census was taken the next spring, and decennial censuses have been maintained ever since. That of 1851, like the American of 1850, was a long step in advance. The Russian censuses had begun earlier, but on the most ancient model, purely for military purposes, and therefore with no count of females. There were

a few partial censuses from 1700 on. In 1718 Peter the Great ordered all landed proprietors to give in an account of their slaves; and the same year organized a body of canvassers to visit all the provinces and make returns to him of peasants, mechanics, domestics, and people without occupation. In 1722 a ukase ordered a census taken every 20 years thereafter, and it was observed till 1782, another taking place in 1796. In 1802 a central bureau was organized, and a census taken; and they have been taken in 1812, 1815, and 1834, decennially 1850-80, then in 1886 and 1897. France began taking them after the Revolution, Prussia in 1805; Austria, which had made rough counts for military conscription, organized a bureau in 1828; Belgium established one immediately after winning her independence in 1833, and it has been perfected by the genius of Quetelet and other eminent statisticians, and furnished most valuable contributions to science. Our own census was entirely independent of all these in origin.

The United States Census.—For the various guesses at colonial population, and the methods of arriving at them, see UNITED STATES (*Population*). It may be mentioned here, as germane to this subject, that when Gov. Hunter of New York in 1712 attempted to take a census, the biblical prejudice before mentioned compelled him to leave it unfinished; and that when the New Jersey government a few years later wished to do so, it did not dare begin. An accurate determination, however, became vital early in the independent life of the country. To apportion equally the burdens of the Revolutionary war, the Congress of the Confederation agreed to defray the charges out of a common treasury, to be supplied by the States in proportion to the value of all the land in each; and to requisition the quotas of land forces according to the quotas of white inhabitants. Under the Constitution of 1787 the question of number became exigent, as direct taxes and representatives in Congress were apportioned according to the number of free inhabitants in each State (including bound servants and excluding Indians not taxed) and three fifths of all others. Censuses, therefore, became part of the ordinary running machinery of the government; and the first one was taken in 1790. Nine months were allowed for the work, but the time was extended the next year, as regularly for many a decade thereafter. The scope of inquiries simply included families: the name of the head alone being set down, with the number of others included, and slaves as a property item, the sex and color of free persons, the number of free white males of 16 and upward, number of free white females, and of all other free persons. The enumeration was committed to the marshals of the judicial districts of the United States (16 in all), who were to employ assistants as needed. No form of schedule was provided, each enumerator using any sheets or blank book he chose. This continued till 1830. There was no central bureau to receive or supervise returns, which were put together by the marshals and transmitted to the President. A penalty of \$200 was imposed for false returns or delay beyond a certain time; and the same on individuals for giving false information or refusing any. The returns in the North were given by counties, cities, and towns; in the South by counties only. Two copies of the enumeration of each

CENSUS

district were to be posted in some public place therein. The cost of this census was \$44,377.28. The result, as usual, pricked many local bubbles; and as the country was not used to this, there was not only general disappointment but distrust of the census, and United States officials carefully explained to foreigners that the returns were very defective. This is not now believed.

The second census, that of 1800, was specifically intrusted to the Department of State. There was no change in methods, except that the secretary was to instruct the marshals as to schedules and interrogatories. The only changes in scope were to classify the ages of free white males rather more minutely, extend the classification to females, and insert the name of county, city, or town where the family resided. Memorials by Thomas Jefferson and Timothy Dwight, under the names of learned societies, wisely suggesting that Congress utilize the occasion by having the census include statistics of mortality, nativity, and industries, were ignored; but took root in later censuses. There were 19 districts, and the cost was \$66,109.04.

The third census, that of 1810, improved somewhat on the loose methods of the two former. The enumerators now had to be residents of their districts, which could not be more than one county or city, but might be several contiguous towns, and must be plainly marked off by natural or political boundaries; and they must make personal inquiries at each dwelling-house or of the head of each family in their district. In Territories the secretary, or if there was none, the governor, replaced the marshal. Attested copies of the returns must be filed with the secretary of state. An attempt at a manufacturing census was made, and the secretary of the treasury was empowered to give instructions for it. But the time was too short; the inquiries were too many and injudiciously framed; the manufactories in a district were generally so few that the returns would disclose their private business, and there was no penalty for refusal to answer; and the returns were scattering and valueless for volume, though they had some value as indicating variety and distribution of industries. There were 26 districts and Territories, and the cost was \$178,444.

The fourth census, that of 1820, for the first time introduced the valuable feature (suggested by Jefferson and Dwight) of distinguishing between natives and foreigners, naturalized or otherwise. It also discriminated the free colored and the slaves by sex and age, and the free whites between 16 and 18. It reduced the manufacturing interrogatories to 14, of much the same scope as now, and a digest was ordered made and printed. This department was a failure as before, however. There were 31 districts, and the total cost was \$208,525.99.

The time of taking the fifth census, that of 1830, was changed on John Quincy Adams' suggestion to 1 June, as it has ever since remained. A very significant provision in the act was to prevent the marshals from blackmailing their subordinates, by exacting either bribes in advance or part of their pay later. Printed schedules were sent out, of uniform size, 18 x 15. The industrial statistics were dropped altogether. But inclusion was made of the deaf and dumb—white, free colored, and slave—classified by age but not by sex, and of the blind, not classi-

fied at all. Ages were also very minutely classified. There were 36 districts and Territories, and the cost was \$378,545.13.

The sixth census, that of 1840, was in one respect the beginning of a new era; in most others, the close of an old one. It first attempted health statistics—those of the insane and idiotic, at public and private charge; educational—scholars in colleges, academies, and public schools, illiterates over 20, etc.; besides Revolutionary pensioners, an item wholly aside. Industrial statistics were also restored, and much matter collected. In a word, it was the first systematic and connected attempt to make the census a general body of usable statistics in the larger sense, a comparative survey of the life and changes of the country. But the effort is all that can be praised; its execution was a national scandal. The errors were so teeming and so monstrous that various bodies sent protests to Congress against its publication, and urged that it be either corrected, or if that were not possible, entirely disowned. This result was due partly to inadequate pay and ignorant enumerators, but partly also to the dislike in many sections to the new questions as "inquisitorial" and offensive. The old dislike to governmental "prying" was strong enough to warrant a prominent paper in becoming its spokesman, insinuating that the census was a "precursor to direct taxes," and that it was unworthy of "the dignity and the high functions of the Federal government to pursue such petty investigations." There were 39 districts, and the cost of the census was \$833,370.95. It was published in three volumes.

All these six censuses had a common defect which robbed them of ultimate statistical value: they lacked uniformity in method, and to a large extent could not furnish comparisons or accurate deductions. The enumeration extended over long periods, many months at a time; the results were not summarized by counties, nor uniformly by cities or towns; the classification of ages of colored people was on a different basis from that of whites, etc.

The seventh census, that of 1850, begins a new era. The blunders of the last one, and the public disgust and indignation, had aroused great discussion as to proper methods; and on 3 March 1849, the same act which created the Department of the Interior also created a census board, consisting of the secretary of state, the attorney-general, and the postmaster-general, to prepare a census schedule including not above 100 inquiries. They framed plans which were adopted by Congress 23 May 1850. These schedules comprised: (1) Free inhabitants. (2) Slaves. (3) Mortality. (4) Products of agriculture. (5) Manufactures. (6) Social statistics. But the great advance which it made was in scheduling individuals instead of families, thereby making full statistical comparison for the first time possible. The name, age, sex, color, and place of birth of each person, free or slave, were now set down. Improvements in method were also made. The enumerators' districts were to be not exceeding 20,000, if feasible, on the basis of the last census; the returns were not to be compiled by the marshals, but at a central office in Washington created within the Department of the Interior. Its head or "super-vising clerk," commonly called "superintendent

CENSUS

of the census," was Joseph C. G. Kennedy of Pennsylvania; the latter part of the compilation was done under the charge of James D. B. De Bow of Louisiana. There were 45 districts, and the work cost \$1,423,350.75.

The eighth census, that of 1860, was on much the same lines as the previous one. Mr. Kennedy was superintendent. Fortunately, the enumeration was finished before the War broke out. The principal change in schedules was to classify females as well as males by occupation. In the compilation, slaveholders and slaves were classified by States and Territories for 1850 and 1860. There were 64 marshals and secretaries. Cost, \$1,969,376.99.

The ninth census, that of 1870, was taken under changed conditions, some of which interfered with its completeness and accuracy. The mass of enfranchised negroes in the South could no longer be counted on plantations by one authority, and were too ignorant to answer questions for themselves; and the Reconstruction conditions greatly impeded work. A new system had been carefully drawn up by Garfield, after consultation with Francis A. Walker, Edward Jarvis, and other eminent statisticians, which would have made partial amends; but it was killed in the Senate. It formed, however, the basis of the next census. Gen. Walker, then chief of the bureau of statistics in the Treasury Department, was made superintendent, and his ability did much to redeem the defective system. The heading "slaves" had of course to be dropped, and the number of male citizens of the United States to be substituted. To satisfy the 15th Amendment, a schedule was introduced of the number of such citizens whose right to vote was denied or abridged except for crime, etc.; but it was valueless. The month of births and marriages within the year was added. In "colored," Chinese and Indians were discriminated from negroes. In "illiterates," those unable to read were distinguished from those unable to write. In nativities, the place of parents' birth was added, for the first time giving the number of native citizens of foreign parentage. A statement of public debts, State, municipal, etc., was included. Many changes were also made for clearness, or to remove objectionable inquiries. The enumerators were put under civil-service reform rules.

A strong effort was made to have an inter-decennial census taken in 1875, but it was not successful, though Grant recommended it in two annual messages. But for that of 1880, the system desired for 1870 was passed, under Garfield's presidency, completely revolutionizing the census methods. The changes may be summarized as follows: (1) The superintendent of the census and his chief enumerators, instead of being mere clerks of the secretary of the interior, became officials directly appointed by the President and confirmed by the Senate. (2) The marshals—court officers appointed for duties unconnected with census work and often conflicting with it—were replaced by supervisors of the census, not to exceed 150 in all, and each State or Territory to have at least one. The entire number were appointed, and New York State had 11. Their assistant enumerators were subject to veto by the census office. (3) The enumerators' districts were reduced to an estimated maximum of 4,000 instead of 20,000,

these subdivisions being also subject to the disallowance of the census office. This increased the number of enumerators from about 6,400 in 1870 to 31,265 in 1880; and enabled not only a swifter completion of work, but much closer local and personal knowledge on the part of enumerators, as each must be a resident of his district. (4) The time of enumeration was reduced to one month, or two weeks in cities of over 10,000 inhabitants by the previous census; making results more nearly simultaneous. (5) Compensation was more closely adjusted to work. (6) Industrial statistics for 279 cities and large towns, and for the country at large in certain selected industries, were withdrawn from the regular enumerators and given to certain special agents, who need not be residents. The enormous advantage of this scarcely needs exposition. Not only did it allow the employment of abler experts, but manufacturers will often give information to distant strangers, to be filed far off, which they would not put in the hands of local residents. In this census also a large use was made of "prior schedules," left with parties before the enumerator called; they had been introduced in 1870, but little employed. This census was by far the best, speediest, and most helpful of all to that date, and marked another era. The scope was also extended. For the first time the statistics of defectives, crime, and pauperism were thoroughly and properly classified; those of the factory system, of churches, museums, taxation, insurance, etc., entirely new, with better ones of schools and colleges, collected independently, were of great utility; and many improvements were made in other schedules. Gen. Walker was the head of this census also, and the author of most of its advances. Its cost was \$5,790,678.40.

The 11th census, that of 1890, was in general taken by the same methods as the 10th. Ten chiefs of division were appointed, 175 supervisors, and 47,975 enumerators. The superintendent was Robert P. Porter. The most important additions were: (1) All surviving soldiers, sailors, and mariners of the Civil War, and their widows. (2) Classification of colored persons according to amount of white blood, from full-blooded negroes up to octo-rooms. (3) Indebtedness of private corporations and individuals. (4) All Indians in tribes, with Indian and English names of each, age, occupation, and whether paying taxes or not. (5) Census of Alaska. (6) Unincorporated express companies. An attempt was made to collect statistics of chronic disease; but the inquiries were too delicate to intrust to local residents or expect people to communicate to such, and the statistics gathered were of no value, besides exciting much public ill-will. Special agents were employed for 1,042 manufacturing centres, in place of the 279 in 1880. Special attention was paid to nativity, to fecundity of native and foreign-born mothers, the expectation of life of children of native and foreign-born parents, naturalization, and ability to read and speak English. Prior schedules were extensively used. Electric tabulation was employed, not alone greatly increasing both speed and accuracy, but enabling various statistical compilations to be made which were otherwise impracticable. It filled 25 volumes, and cost \$11,547,127.13.

For the 12th census, that of 1900, preparations had been mooted before the 10th was well under way; and the question of a permanent census bureau, strongly urged over half a century since by the able statistician De Bow, was brought up, and its merits set forth in a valuable and exhaustive report by Supt. Porter. After much debate, an act of 3 March 1899 established such an office in the Department of the Interior. By this act the superintendent of the census is entitled the director of the census. The President, who appoints him, must also appoint an assistant director, who must be an expert statistician; and the director is to appoint five known and tried statisticians as chiefs of divisions, a geographer, a chief clerk, and a disbursing clerk. The first director under this bill was William R. Merriam; assistant director, Frederick H. Wines; chiefs of divisions, William C. Hunt, population; William A. King, vital statistics; S. N. D. North, manufactures; Le Grand Powers, agriculture; Walter F. Wilcox, methods and results; geographer, Henry Gannett. The law creating this bureau, however, greatly limited its scope. The collection of "side" statistics was thought to retard the preparation and publication of those assumed to be alone of general interest, and the inquiries were restricted to the four heads of population, mortality, agriculture, and manufactures. The work was to be finished within two years; and at this writing (May 1903) three of the heads have been published, two volumes for population, two for agriculture, and four for manufactures. This limitation would not be regrettable—the census organization not being the ideal one for many classes of statistical inquiries—but that Congress is not likely to appoint other boards or commissions to do the work thus dropped, as is done in foreign countries. There the census relates only to population, and other inquiries are made through other sources, or by copying registration returns. Congress, however, is doubtful of its power to compel answers except through the census acts.

State Censuses.—A number of States have Constitutional requirements that a State census shall be taken once in 5 or in 10 years, or between two national censuses; but only a few pay any attention to the matter or attain results of any value. Massachusetts, Rhode Island, New York, and Michigan thus far are the only States which have done good work in this line. The Massachusetts censuses from 1855 on, and the Michigan of 1874 and 1884, are notably good. On 3 March 1879, an act of Congress provided that any State which will take an interdecennial census in all respects equal to that of the United States, and file a copy with the secretary of the interior, shall receive from the national government 50 per cent of the amount paid to supervisors and enumerators, plus 50 per cent of the gain per cent in population between the two last preceding national censuses. Even this lure, however, has not thus far increased the interest of the States in their statistics.

WILLIAM R. MERRIAM,
Supt. Twelfth Census.

Cent, a United States coin and money of account, the 1-100 of a dollar. The convenience of decimal computation has caused in various countries the division of the monetary unit into

hundredths, with names derived from Latin *centum* or its adjectives; as the French franc into centimes, the Dutch guilder into cents, the Italian lira into centesimos, the Spanish-American dollar into centavos, etc. Jefferson regularly used "cent" to mean the hundredth of any unit of mensuration; but in its first suggestion for our coinage it meant 100. The inconvenience of the English system being felt, Congress in 1781 instructed Robert Morris to devise a system of national coinage; and he proposed a unit of $\frac{1}{4}$ grain silver (or 1-1440 of a Spanish dollar, familiar in the colonies), of which 100 were to make a cent (about 7c. of ours), 500 a quint (347c.), and 10,000 a mark (\$6.94). Jefferson proposed instead the dollar as the unit, the smallest coin to be of copper and 1-200 of it (that is, the old English farthing, our half cent); this was adopted 6 July 1785. But on 8 Aug. 1786, an act was passed, still modeled by Jefferson, to coin a cent, of which 100 were to weigh $2\frac{1}{4}$ pounds avoirdupois (157.5 grains each), and be equal to a dollar, and a half-cent proportionate. This was the first use of the name in our coinage, and doubtless represents Jefferson's "hundredth." The "cents" prior to this have not that name on them, and are really English half-pence. The difficulty of displacing a popular name is shown by that of "penny," which still clings tenaciously though absurdly to our cent, only half its value. Congress in 1787 established a mint in New Haven, and for years coined there the "Fugio" or "Franklin" cents, familiar to collectors. But from 1785 to 1788 several States coined copper "cents" on their own account. Vermont (not yet admitted) began in June 1785; Connecticut in October 1785; Massachusetts late in 1786 (real cents and half-cents); New York, 1786; New Jersey, 1786 (coppers 15 to the shilling). Under the Constitution the first coinage act was passed 2 April 1792, and raised the weight of the cent to 264 grains; but on 14 Jan. 1793, it was reduced to 208, and on 26 Jan. 1796, to 168, the half-cent always being proportional. The first coinage under the new act was in 1793. This old-fashioned "copper" remained unchanged except in pattern till 1857, and its forms from 1793 to 1857 are of seven types: (1) 1793, chain or link around the word "cent"; (2) 1793, wreath in place of chain; (3) 1793-6, liberty cap on pike over left shoulder of "Liberty"; (4) 1796-1807, "Liberty" with draped bust; (5) 1808-14, filleted head with 13 stars; (6) 1816-39, plain coronet with coiled hair; (7) 1839-57, same with braided hair. No cents were coined in 1815 or 1835. Those of 1799, 1793, and 1804, are very rare, as are also the *copper cent* of 1856, and the half-cents of 1793, 1831, 1840 to 1848, and 1852. On 3 March 1851, a 3-cent piece was authorized, of $12\frac{3}{4}$ grains, 75 per cent silver, 25 copper, legal tender to 30 cents; on 3 March 1853, it was raised to .900 fine, but reduced to 11.52 grains, $\frac{3}{50}$ of the half-dollar. On 21 Feb. 1857, the half-cent was abolished, and the old cent replaced by a smaller new one, of 72 grains, .88 copper and .12 nickel. On 22 April 1864, this was supplanted by a bronze cent, 48 grains (the present one), .95 copper and .05 tin and zinc, legal tender to 10 cents; and a bronze 2-cent piece, twice its weight and legal tender. On 3 March 1865, a 3-cent piece was authorized, $\frac{3}{4}$ copper and $\frac{1}{4}$ nickel, 30 grains, legal tender

CENT — CENTAURY

to 60 cents; but the ones and twos were made legal tender to only four cents. On 16 May 1866, a 5-cent piece (the "nickel") was authorized, same material as the 3, 77.16 grains, legal tender to \$1. On 12 Feb. 1873, all cents and their multiples were discarded except the 1, 3, and 5, as above, each to be legal tender to 25 cents; and on 26 Sept. 1890, the 3-cent piece was discarded. See NUMISMATICS.

Cent, a name given under the old Germanic constitution to a small portion of territory. Each province or district was subdivided into so many cents, and was placed under the special jurisdiction of an overseer or centenarius. The name corresponds with hundred as in English territorial division.

Cent-Gardes, sän-gärd, **Les** (Fr., "The Hundred Guardsmen"), a body-guard acting in the service of the French king during several centuries. See GUARDS.

Cent Jours, sän zhoor, **Les** (Fr., "The Hundred Days"), the second period of the reign of Napoleon I., so called because it lasted precisely 100 days, from 20 March 1815, when he re-entered Paris on his return from Elba, to 28 June of the same year, when the second restoration was established.

Cent Nouvelles Nouvelles, sän noo-vël noo-vël, a collection of facetious tales, first published at Paris in 1486. They were told at the table of the dauphin, afterward Louis XI., in the castle of Genappe during his exile. Their arrangement in their present form has been attributed to the Count of Croi, to Louis himself, and to Antoine de La Salle. The latter, however, seems to have been the editor. The work is a curious example of a kind of literature distinctively French, and which, since its revival by Voltaire in the last century, has always been successfully cultivated; the literature that considers elegant mockery and perfection of form adequate compensation for lack of morality and lofty ideals. The historical importance of the collection arises from its giving details regarding the manners and customs of the 15th century that can be found nowhere else. Its very licentiousness is commentary enough on the private life of the men and women of the time. In spite of its title, however, there is nothing novel in the incidents upon which the 'Nouvelles' are based. Their novelty consists in their high-bred brightness and vivacity, their delicately shaded and refined but cruel sarcasm. With a slight modernization of the language they might have been told at one of the regent's suppers, and they are far superior to those related in the *Ileptameron* of the Queen of Navarre. The 'Nouvelles' also show us that the Middle Ages are past. Instead of gallant knights performing impossible feats to win a smile from romantic châtelaines, we have a crowd of princes and peasants, nobles and tradesmen; all, with their wives and mistresses, jostling and duping one another on a footing of perfect equality. Another sign that a new era has come is the mixed social condition of the 32 story-tellers; for among them, obscure and untitled men, probably domestics of the Duke of Burgundy, figure side by side with some of the greatest names in French history.

Centaurea, sën-tô'rë-a (commonly called BACHELOR'S-BUTTON, CORN-FLOWER, DUSTY-MILLER, or KNAPWEED), a genus of annual or perennial herbs of the natural order *Compositæ*. There are about 400 much confused species, mostly natives of western Asia and the Mediterranean region. A few are found in the western hemisphere, but only one, *C. americana*, in the United States. This species, popularly called basket-flower, is a very attractive hardy annual with rose-colored flowers. Many of the species are widely used in ornamental gardening. The following are among the most popular garden sorts: *C. cyranus*, the blue-bottle or corn-flower, common in European grain fields and frequently found wild in America. Its blue flowers yield a blue dye. *C. cineraria*, the dusty-miller, has white hairy leaves, and when grown as an edging plant—its most popular use—it is not allowed to flower. *C. moschata*, sweet-sultan, is widely grown for its large, fragrant flower-heads. *C. montana*, mountain bluet, which originally had blue flowers, has developed various other tints under cultivation. All the species are easily grown from seed and thrive in any good garden soil.

Centaurs, sën'tôrz, in Greek mythology, a fabulous race of people in Thessaly, on Mount Pelion. According to fable they sprang from the union of Ixion and a cloud. They are said to have been half horse and half man, and the fable is explained in this manner: The Centaurs first practised the art of mounting and managing horses. In the time of the Thessalian king Ixion a herd of wild bulls on Mount Pelion committed great devastations in the adjacent country. Ixion offered a reward to whoever should destroy them, in consequence of which the Centaurs trained horses for riding and slew the bulls. Mythology relates the combats of the Centaurs with Hercules, Theseus, and Piriithous. The latter, at the head of the Lapithæ, another Thessalian nation, their hereditary enemies, entirely defeated the Centaurs, killed many, and drove them from Pelion. The Centaurs, Nessus, Chiron, and others are famous in ancient fable. See CHIRON; DEJANIRA; HERCULES.

Centaurus, sën'tô-rüs, or **The Centaur**, a southern constellation, only a small part of which rises in our latitude. Two stars of the first magnitude are catalogued in the portion which does not appear above our horizon. This is one of the 48 ancient constellations formed by Ptolemy, who first discovered the likeness of a centaur in it. On the celestial maps of the Arabs it is represented by a bear mounted on horseback.

Centauray, a genus of plants (*Erythraea*) of the natural order *Gentianacæ*, of about 30 widely distributed species, mostly natives from western Asia to western Europe, of which two are of distinct ornamental merit. One of these (*E. venusta*) is from California; the other (*E. massoni*) from the Azores. They are hardy little annuals with rose-colored flowers, and are frequently planted in rockeries, in the soil of which the seeds may be sown in early spring. Some of the related species have been used to a small extent in domestic medicine, but rarely in regular medical practice. American centauray (*Sabbatia angularis*), of the same natural order,

Photograph by J. Horace McFarland Co.

CENTAUREA

CENTAVO — CENTERVILLE

is widely distributed in rich soil and sunny situations from western Canada to the Gulf States. It is often cultivated for its cymes of fragrant showy white or rose-colored flowers. Like the above, it has been used to a small extent in domestic medicine for simple ailments.

Centavo, thên-ta'vô, a Chilean coin equivalent to the cent (q.v.).

Centenary, the commemoration of any event, as the birth of a great man, or the founding of a city or institution, which occurred 100 years before.

Centennial Exhibition, a World's Fair held in Philadelphia, Pa., from 10 May 1876, to 10 November of the same year. To celebrate the 100th anniversary of American independence, an association of Philadelphians in 1870 proposed an international exhibition of arts, manufactures, and agricultural products, to be held in the city where independence was declared. Congress passed an act 3 March 1871, authorizing the exhibition and also appointed a commission of one member and an alternate from each State and Territory, nominated by the governors, to report on dates of opening and closing, plans for buildings, method of receiving and classifying articles, custom-house regulations. The commission was organized 4 March 1872, with Joseph R. Hawley of Connecticut as president; and on 12 May chose as director-general of the exhibition Alfred F. Goshorn. On 1 June Congress appointed a centennial board of finance, to raise funds for the exhibition. This board was to solicit subscription to \$10,000,000 of stock, and the corporators and subscribers were to elect 25 directors, who should apply the funds on the plans of the commission. Of 227,040 of individual subscriptions, Pennsylvania gave \$1,749,468. The city of Philadelphia added \$1,500,000; the State of Pennsylvania \$1,000,000 more. Then Congress appropriated \$1,500,000, besides \$500,000 for a government building. Fairmount Park was selected as the site, 236 acres being used for the purposes of the exhibition. The buildings of the exhibition proper consisted of the main building (for manufactured products, mines and metallurgy, the public works of all nations, and a conspectus of science and education), built of iron and glass with masonry foundations, 70 feet high, 1,880 x 464 feet, with central transept of 416 feet and two end transepts of 216; Machinery Hall, 1,402 x 360, of wood and glass on masonry foundations, occupying with an annex nearly 13 acres; Agricultural Hall, 820 x 540, of wood and glass; Horticultural Hall, built by the city of Philadelphia, a permanent structure of iron and glass in Moorish 12th-century style; Memorial Hall, intended as a permanent art gallery, of granite, glass, and iron, in Renaissance style, 365 x 210 and 59 feet high, with a central tower 150 feet high, surmounted by a colossal statue; the United States Government Building, 504 x 306; the Women's Pavilion, an acre in extent, not only for the convenience of women, but for the collection and exhibition of their work; the Shoe and Leather Building, and the Carriage Building, besides annexes. Moreover, 26 States erected buildings of their own, costing over \$400,000; and a number of foreign countries, out of 49 which took part in the proceedings by invitation, erected their own buildings. There were over 200 separate buildings in

all. The admission fee was 50 cents; 7,250,620 paid it in full, 753,654 paid a special 25-cent rate, and 1,906,692 went in free, making 9,910,966 admissions in all.

By the system of awards adopted the exhibits—to the number of over 50,000—were divided into 36 groups, and these subdivided again and again into small sections. Each of the last was assigned to a special jury of awards, who had to make a statement in writing of the special merits they found in the articles which they esteemed best, and the uses for which each was best fitted, and to sign their names to the award: this left no room for carelessness or irresponsibility, and gave the maker the benefit of names of known weight. These judges included many of the ablest and most famous men of science and the professions and other great experts in the Western World; and the awards have been a source of just pride.

The exhibition was a most important landmark in the industrial history of the country, and other countries. Not only did it make later ones possible and successful here, but it diffused inventions, broke down stolid self-conceit, and immeasurably advanced the knowledge of all the nations which took part in it. For instance, the Bell telephone was first exhibited there, and gained immediate celebrity from Sir William Thomson's enthusiastic praise; and the American bicycle manufacture sprang from Col. Pope's inspection of English cycles there. It showed European countries with new clearness the marvels of American machinery-making, especially the immense development of mechanism with interchangeable parts, from watches to steam boilers and artillery. It made the first collection ever attempted of women's work on a large scale. It first made the beauty and grace of Japanese decoration and patterns popularly known. It shed new light on art principles in general. It illuminated educational systems with light from foreign sources. No public or private money was ever better invested than that devoted to creating and profiting by this collection. The official account of the exhibition was published by the government in 1880.

Centennial State, a popular name given to the State of Colorado on account of its admission to the Union in 1876, the 100th year of American independence.

Centeno, Diego, dē-ă'gō thên-tā'nō, Spanish soldier: b. Ciudad-Real, Spain, 1504; d. La Plata, upper Peru, 1549. Going to South America he accompanied Alvarado to Peru and soon became famous as a skilful fighter.

Center. See CENTRE.

Centerville, Iowa, city in Appanoose County; on the Rock Island, the C. B. & Q., the I. & St. L. and the Iowa Central R.R.'s, 70 miles south of Des Moines. The town was settled in 1832 and was incorporated as a city in 1846. It is the centre of a coal mining, agricultural and stock-raising region. It has four banks, 15 churches, and an excellent public school system. Pop. (1900) 5,256.

Centerville, Va., a village of Fairfax County, 27 miles west of Washington. It is memorable for the series of battles fought in its vicinity on the last days of August 1862, in which the Federal army, under Gen. Pope, suffered heavy loss and a severe repulse.

Centesimo, sĕn-tĕs'ĭ-mō, a coin of Italy, Peru, etc., equivalent to a centime (q.v.).

Centiare, sĕn'ti-ār. or sĕn-tyār, a measure of surface of the metric system, the hundredth part of an are (q.v.) or one square metre, equivalent to 10.764 square feet.

Centigrade Scale. See THERMOMETER.

Cen'tigram, or **Cen'tigramme**, a weight of the metric system, the hundredth part of a gram (q.v.), equivalent to 0.15432 grain troy.

Centiliter, or **Centilitre**, sĕn'ti-lĕ-tĕr, a measure of capacity of the metric system, the hundredth part of a litre (q.v.), equivalent to a little more than three fifths of a cubic inch.

Centime, sĕn-tĕm, a French coin, in value one hundredth of a franc or about one fifth of a United States cent.

Cen'timeter, or **Cen'timetre**, a measure of length of the metric system, the hundredth part of a metre (q.v.), equivalent to 0.3937 inch. Its abbreviation is *cm*.

Centimeter-Gramme-Second System. See UNITS.

Cen'tipede, or **Centiped**, one of those myriapods (*Chilopoda*) with long, many-jointed, flattened bodies, each segment bearing only a single pair of legs. The mouth-parts, besides a pair of jaws (mandibles), consist of two pairs of maxillæ, those of each pair being fused together in the middle. The first pair of legs are fused at their base, and form the poison-fangs, the poison-gland being situated in the base, and the poison oozing out of an orifice at the end of the leg. The single oviduct and corresponding male duct open at the end of the body in the penultimate segment. The centipedes (*Scolopendra*) are mostly confined to the tropics, a small species extending as far north as North Carolina. Those of the West Indies and the tropics in general are eight to nine inches in length, one species, however, attaining the length of 18 inches. Their bite is dangerous, quite as much so as the sting of the scorpion. They are ferocious when attacked or seized, biting energetically. In the northern States the centipedes are represented by the species of *Lithobius* (*L. americanus*), which are wrongly called "earwigs," and live under stones, under the bark of fallen trees, etc. They prey on insects and worms. They have been observed to attack earthworms, grappling with them for several hours and, after killing them, sucking their blood. Very long, slender forms are *Geophilus* and its allies. The body is composed of from 30 to nearly 200 segments, each bearing a pair of legs. They are eyeless, and live buried in the sand, coming to the surface under stones.

The centipedes are hatched with numerous segments, and corresponding legs. Wood states that the female of a centipede (*Scolopocryptops scxspinosa*) guards her young by lying on her side, and then coiling her body, passes them along by a quick action of her feet, thus arranging them satisfactorily to herself. He also describes the manner of molting in this species.

The chilopods are more nearly related to the insects than are the millipedes (q.v.). They are a less ancient group. No true *Chilopoda* are known to exist in rocks older than the middle Tertiary period, species of *Cermatia*, *Scolopendra*, *Lithobius*, and *Geophilus*, having been de-

tected in amber and the gypsum beds of Aix, Provence, France, of Oligocene age. (See CHILOPODA.) Consult. Wood, 'The Myriapoda of North America' ('Transactions,' Amer. Phil. Soc., Philadelphia 1865); also the writings of Meinert.

Centlivre, sĕnt-lĕvr, **Susanna Freeman**, English actress and dramatist: b. Ireland about 1667; d. London 1 Dec. 1723. When very young she married a nephew of Sir Stephen Fox. Becoming a widow within a year she took for a second husband an officer of the army of the name of Carrol, who was killed in a duel the second year of their wedlock. This event in her singular career reduced her to considerable distress, and led her to attempt dramatic composition. Her first production was a tragedy entitled the 'Perjured Husband,' performed in 1700. This was followed by several comedies, chiefly translations from the French, which exhibited the vivacity that distinguishes her literary character, and met with some temporary success. She also tried the stage as an actress on the provincial boards, and by that means attracted the attention of her third and last husband, Mr. Centlivre, Queen Ann's head cook, whom she married in 1706. She still continued writing for the stage, and produced several more comedies. Some of these remain stock pieces, of which number are 'The Busy Body'; 'The Wonder'; and 'A Bold Stroke for a Wife.' They are diverting from the variety of incident and the liveliness of the characters, but want the accompaniments of adequate language and forcible delineation. They partook of the license of the age. Mrs. Centlivre enjoyed the friendship of Steele, Farquhar, Rowe, and other wits of the day. Having, however, offended Pope, she obtained a place in the Dunciad, but is introduced by no means characteristically. An edition of her works with a biography appended appeared in 1872.

Cent'ner, a German weight, in common use on the continent of Europe, which is nearly the equivalent of the British hundredweight. It formerly varied in the different German states, but since the introduction of the metric system of weights and measures into the German empire, 1 Jan. 1872, the value of the centner has been fixed at 50 kilograms, or 100 German pounds, equivalent to 110.23 pounds avoirdupois. In Austria it is equal to 110½ pounds, and in Sweden to 112.06 pounds.

Cento, chĕn'tō, Italy, a city 13 miles north of Bologna, on the eastern bank of the canal of Cento, and near the river Reno. It is surrounded by a rampart and ditch, and contains several churches, convents, and a cathedral. The celebrated painter, G. F. Barbieri, commonly called Guercino, was born here about 1590. Pop. 5,000.

Cento, sĕn'tō (Latin, "patchwork"), originally a cloak made of patches; hence, as Lessing observes, the dress of Harlequin is called in Apuleius *mimi centuculus*. The term has been transferred to such poems as have been formed out of verses taken from other poems. It was a particular art to combine passages of different authors on different subjects in this manner so as to form a regular whole. Thus there were in early times Vergilian centos (*centones vergiliani*), in which most of the verses

CENTRAL AFRICA PROTECTORATE — CENTRAL AMERICA

were taken from Virgil; for instance, the 'Cento Nuptialis' of Ausonius, and centos from the verses of Homer (*Homero-centones*).

Central Africa Protectorate. See **BRITISH CENTRAL AFRICA PROTECTORATE**.

Central America is a continent of distinct geologic formation, with east and west mountain-folds, at right angles to those of North and South America. Though on the map it appears to be a mere isthmus extending in a southeasterly direction from Mexico to Colombia, between the Caribbean Sea and the Pacific Ocean, it is in fact structurally much more nearly related to the West Indies, including the Gulf of Mexico and the Caribbean Sea, and to the northern coast of South America, than to the main bodies of the larger continents. Probably in the Tertiary period Central America and the Antilles together formed a great island or archipelago lying between North and South America. (Compare Robert T. Hill's 'Cuba and Porto Rico,' etc.). This subject will be referred to below, in connection with "volcanoes and soil."

Politically, the name groups together Guatemala, Honduras, Salvador, Nicaragua, and Costa Rica: five republics which are characterized in the treaty of peace signed at Corinto, Nicaragua, 20 Jan. 1902, as "the Central American family." Moreover, the Isthmus of Panamá at the commencement of its history under the Spanish régime was associated not less intimately with the settlements in the region north and west of it than with those of South America; British Honduras (Belize) also, an English colony, lying between Guatemala and the Caribbean Sea, has been connected about equally with the history of the Central American states and with that of Yucatan (Mexico). We shall therefore mention both Panamá, a department of Colombia, and British Honduras in the following historical sketch.

History.—Rodrigo de Bastidas, a notary of Triana, was the first Spaniard to explore the Caribbean coast of Central America. He embarked at Cádiz in October 1500; and, after reaching the mainland of South America near the present Venezuelan boundary, coasted westward and made observations of the isthmus from a point below Darien to Nombre de Dios. Columbus, on his fourth voyage to America, sailing from Cádiz 9 May 1502, and stopping at Santo Domingo on the way, arrived off the shore of Honduras July 30. There he heard reports of the wealth of Mexico, but decided to continue the voyage southward, searching for a strait that should lead across terra firma to India. Thus they passed a cape to which they gave the name Gracias á Dios, and on 25 September reached the river San Juan de Nicaragua, and heard stories from the natives which made them believe they were within a nine-days' journey of a splendid land, such as Marco Polo had described in his veracious account of travels in Asia, and that the river Ganges lay only a little beyond. On 7 October they came to the beautiful Laguna de Chiriqui, and on the adjoining Veragua coast they obtained a large amount of gold by trading with the natives.

Columbus lingered in the immediate neighborhood of the Chagre (now called Chagres) River and Colon—at Porto Bello from 2 to 9 November, and at other points within a few

miles for three weeks and five days. Thus during more than a month the great discoverer hovered voluntarily about the spot where the strait he dreamed of was to be cut after four centuries should have elapsed. And when he thought to return by the way he had come, abandoning the search, stress of weather held his vessels back, so that it was not until 6 Jan. 1503, that they anchored in a little river just west of Colon. He wished to plant a colony on the coast between Veragua and Cerebaro, but, hostilities breaking out between the Spaniards and the natives, the former were obliged to abandon their attempt, and once more Columbus passed the place of the future canal, clinging to the shore before setting a straight course for Jamaica.

First Spanish Colonies.—In 1506 Juan Diaz de Solis and Vicente Pinzon sailed along the coast of Honduras westward, exploring the Gulf of Honduras, in search of a passage by water to the Far East—India and Cathay. Several years passed before the Spanish king, Ferdinand, authorized Alonzo de Ojeda and Diego de Nicuesa to colonize and govern in his name the northern coast of South and Central America. The river Darien or Atrato was made the dividing line between their dominions. The eastern or South American portion was called Nueva Andalucia, and of this Ojeda was made governor; the western division was named "Golden Castile." *Castilla del Oro*, and the command given to Nicuesa. The latter secured the larger number of followers; the former, however, attracted to his standard Martin de Enciso, afterward governor, Balboa, discoverer of the Southern Sea, and Francisco Pizarro, conqueror of Peru. The forces of both governors suffered extreme hardships. Nicuesa's capital was at Nombre de Dios, Ojeda's at San Sebastian—so named because the Indians afflicted them as that saint was tortured. Ojeda returning to Española, where he died, Enciso, Balboa and Pizarro removed the capital of Nueva Andalucia to Antigua del Darien—that is, a point within Nicuesa's dominions; but the natives of Darien did not poison their arrows. In the contest for supremacy that ensued, Nicuesa was the loser. Balboa assumed command, and Antigua became the centre of Spanish enterprise in that part of America. On 25 Sept. 1513, Balboa discovered the Southern Sea, and four days later took possession of it, with all its lands and ports and islands in the name of the king and queen of Spain. Before news of this discovery reached the Spanish court, a successor to Balboa had been appointed in the person of Pedrarias (also called Dávila). In 1517 Balboa was falsely charged with treason, and executed. Pedrarias Dávila, being superseded in command, migrated to the south coast and founded the city of Panamá, 15 Aug. 1519.

A voyage into the unknown northwest from Panamá was made in 1522 by Gil Gonzales, who explored the Dulce and Nicoya gulfs indenting Costa Rica's southern shore. Thence northward 50 leagues he went, to the domain of a chief whose name was Nicaragua, and who dwelt near the principal lake of that region. Gonzales learned that this lake, though lying near the Southern Sea, had an outlet to the Caribbean. In his narrative he says that the discovery is important, inasmuch as only "two or three leagues of very level road separate the two

CENTRAL AMERICA

seas." The expedition returned to Panamá in 1523, after baptizing thousands of natives and securing 112,000 *pesos* of gold. On 15 Sept. 1521, Panamá was made a city with royal privileges; the episcopal see was transferred to it; from this base expeditions were sent out toward Peru as well as into the northwest. Pedrarias, in 1524, dispatched Francisco Hernandez de Cordova with Hernando de Soto and other captains to Lake Nicaragua. Gil Gonzales, continuing his discoveries in Honduras and Nicaragua, came into collision with de Soto; and only a little later one of the captains of Hernan Cortez, the Spanish conqueror of Mexico, appeared as a claimant for the territory of Honduras.

In the latter part of October 1524 Cortez set out from Mexico, marching to Honduras with an army of about 100 horsemen, 40 archers and arquebusiers, and 3,000 native warriors and servants. After making himself governor of the country, he returned in triumph to Mexico City in May 1526. Pedrarias went to Nicaragua about the same time: there were rival Spanish governors even then in Nicaragua and Honduras. Guatemala and Salvador were overrun by Pedro de Alvarado, second in command to Cortez: the former country, in which a great empire had existed at the beginning of the Christian era, was inspected by Alvarado in 1522, and conquered with a small force of Spaniards and native allies before two years had passed.

Veragua.—In 1535 an unsuccessful attempt to colonize Veragua was made in the interest of the descendants of Columbus (on whom the titles, "Duke of Veragua," etc., had been conferred), and a still more calamitous enterprise was that of Diego Gutierrez, a citizen of Madrid who led an expedition to Costa Rica north of Veragua in 1540. Francis Drake, English privateersman, attacked Nombre de Dios in 1572. Again, in 1595, Drake (now Sir Francis, knighted for his feat of sailing round the world), Sir John Hawkins and others took Nombre de Dios; but an English force of 750 men sent to attack Panamá was defeated by the Spaniards when half-way across the isthmus. Drake, dying on 28 Jan. 1596, was buried off Porto Bello. The conquest of Costa Rica was undertaken by Nicaraguan Spaniards in 1560. Partial success rewarded the efforts of the soldiers; meanwhile, however, great progress had been made in the pacification of that province by the efforts of Franciscan friars.

Buccaneers in the 17th Century.—Captain William Parker, sailing from Plymouth in November 1601, captured Porto Bello. In December 1616 the king of Spain informed the governor of Castilla del Oro that he and the commercial world believed that communication might be easily established between the oceans by constructing a canal. This was the century of English depredations and of Spanish idle dreaming—Spain's centuries of vigorous expansion having passed. In 1668 the Welsh buccaneer Morgan plundered Porto Bello, his foul cruelty rivaling any Spanish misdeed in this blood-stained region. Three years later, having at his disposal a fleet of 37 ships and a force of 2,000 fighting men, he captured Panamá (January 1671). The inhabitants set fire to their homes, and built a new city of the same name at a little distance in a locality less exposed to

attack. Granada, in Nicaragua, was sacked by French and English pirates in 1686.

Scotch Colony on the Isthmus.—A number of influential Scotchmen, chief of whom was the founder of the Bank of England, William Paterson, were authorized by the Scottish parliament in 1695 to found colonies in savage lands; afterward obtaining letters patent from William III. of England. Paterson chose Darien, believing the control of the traffic of the isthmus to be essential to the prosperity of England; he certainly was not, as is incorrectly and commonly stated, merely anxious to make money for his company, and reckless of consequences to the colonists. See Bannister's 'Life'; Rodriguez's 'Anexion de Cuba'; etc. The largest and most costly expedition that had yet been fitted out for colonization in America sailed from Leith, 26 July 1698, and founded "New St. Andrew." Subsequently recruits were sent out to them; but the project came to a miserable end. More than 2,000 lives and several millions of money had been lost, when the survivors were starved into surrender by the Spaniards.

A British squadron commanded by Admiral Edward Vernon (21 Nov. 1739), took Porto Bello, but was defeated at Cartagena. Meanwhile English settlements of a very peculiar character had been begun in Mosquitia and at Belize.

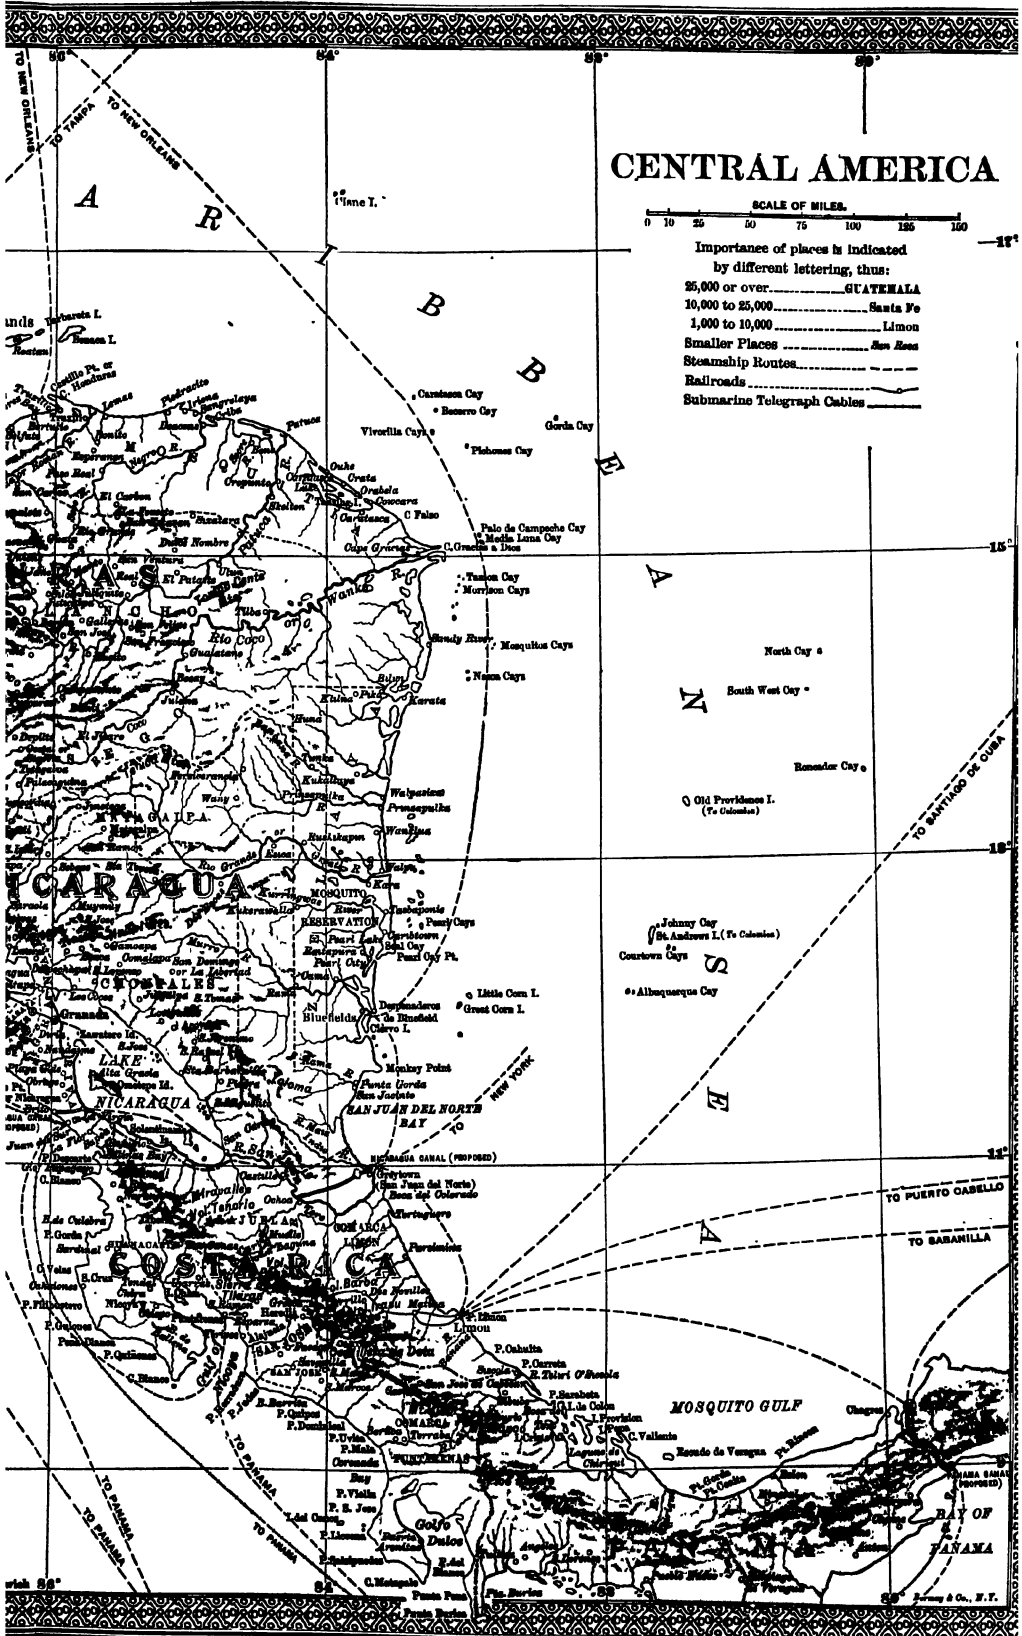

Mosquito Coast.—The Misskito tribe, called by the Spanish and English "Sambos" or "Mosquitos," a hybrid people, descendants of fugitive slaves, "Cimarrones," and natives, ruled by an hereditary king, dwelt on the eastern coast of Honduras and Nicaragua in the 17th century. Unoccupied by the Spanish, this coast was frequented by buccaneers, who made Cape Gracias á Dios, on the dividing line between the colonies just mentioned, their rendezvous. Small settlements of English adventurers existed in this region; by the treaty of Madrid (1670) certain rights were conceded to Great Britain; the British claim was asserted (1744) by sending troops and building forts, but withdrawn (1786) when an agreement was reached as to the cession by Spain of the territory on the north coast of the Gulf of Honduras to which we shall now refer.

The English Colony.—The foundation of Belize, on the coast east of Guatemala and south of Yucatan, by the Scotch buccaneer Peter Wallace, has been described in the article "Belize." The ex-freebooters of Belize, reinforced by other white adventurers, Mosquito Indians, etc., were able to exploit the rich forests and hold their own, or more, in the contest for the possession of this territory waged at intervals between the authorities of Yucatan and the wood-cutters (regarded as interlopers) from 1733 until the end of the 18th century. The treaty of Versailles (1783) defined the limits of Belize; such limits were more precisely stated in the treaty signed at London, 14 July 1786; but the boundaries were subsequently extended by encroachments of the wood-cutters. Thus England, retaining the region now known as the colony of British Honduras, abandoned possession of the Mosquito coast, though her claim to exercise a certain degree of influence in the latter territory (from which the Spaniards were expelled by the Sambos in 1796) was not expressly and absolutely surrendered until 1850 or 1860. (See treaties mentioned below.) Before that deter-

mination, several reverses were sustained in Nicaragua. An English force was repulsed at Fort San Carlos in 1769. A few years later the design to sunder the Spanish provinces of Central America, and at the same time to capture a route for an interoceanic canal, by taking possession of Lake Nicaragua and the cities of Granada and Leon (see Bancroft's 'Central America'), proved infeasible. An English force of about 1,800 men, including a party of marines under Horatio Nelson, was forced by the deadly fevers to abandon the attempt.

Spain in Possession.—Except Belize, Mosquitoia, and large tracts in which the Indians remained nearly undisturbed, Spain now held the land, but no longer had energy or opportunity to develop its natural resources. The natives, more docile and servicable than in other parts of America, seldom increased the difficulties of the situation by uprisings; there was, however, little incentive to accumulate property in a land menaced constantly for a hundred years by English, Dutch, and French pirates, and the mother country had grown too poor to take the lead in industrial enterprises. The several divisions of an apathetic population were easily drawn together for administrative purposes: the captain-general of Guatemala by the middle of the 18th century controlled the provinces of Costa Rica, Honduras, Nicaragua, and Salvador, beside others now within Mexican boundaries. Revolt against Spain was the form in which the spirit of the people, awakened from this lethargy, naturally expressed itself. Unfortunately armed revolt has ever since been too closely identified with progress in the popular conception. The first weak blow for Central American freedom was struck in San Salvador, 5 Nov. 1811. A sequel to this attempt (in Leon, Nicaragua, 13 Dec. 1811) duplicated this Salvadoran effort, in result as in motive. A third failure was recorded when the Colombian insurgents (1820) fitted out a combined sea and land expedition to operate against the towns of Omoa and Trujillo. The Isthmus of Panama cast in its lot with South America, rather than with Central America, by voluntary annexation to the republic of Colombia on 28 Nov. 1821. (For its subsequent history see *COLOMBIA* and *PANAMA*.) The declaration of independence at the city of Guatemala, 15 Sept. 1821, was little more than an echo of the triumphant cry of other Spanish-American colonies in revolt; it was soon followed (5 Jan. 1822), by a decree of the *junta directiva* annexing Central America to Mexico. Salvador refusing to join in this surrender, a war with Guatemala ensued. Before 18 months had passed the Central American provinces resolved to form a union and constitute a single nation. On 1 July 1823 a national constituent assembly expressed this purpose, the name chosen for the nation being *Provincias Unidas del Centro de America*.

Slavery Abolished.—Though laggards in the race to win freedom, the Central Americans were prompt in bestowing it. The laws of 31 Dec. 1823, and 17 and 24 April 1824, emancipated their slaves and declared that slaves of other countries on coming to Central America should be freed. When dissensions and civil war broke up their confederacy, they had at least taken one step forward, in advance of their neighbors. The congressional decree of 30 May 1838, granting to the states the privilege of unrestrained

action in most important matters practically dissolved the union, though Salvador tried to maintain or renew it long after the other confederates withdrew. Nicaragua, on recovering her autonomy, became involved in a dispute with Great Britain, the latter upholding the claim of the Mosquito king to all the territory lying between Cape Gracias a Dios and the mouth of the San Juan River, and sending (January 1848) two warships to occupy the port of San Juan. Nicaragua yielded provisionally to superior force. At this point the intervention of the United States was felt. The Clayton-Bulwer treaty, concluded at Washington 19 April 1850, between the United States and Great Britain, provided that neither power should occupy, fortify, colonize, or exercise dominion over any portion of Central American territory (except Belize), or make use of a protectorate in any form. In regard to this treaty the statements have been made: (1) That it guarantees Central American independence; (2) That it encourages the maintenance of English influence. Both statements are correct. The English influence was considered beneficial within certain limits (see *BE-LIZE*.) By the Zeledon Wyke treaty of 28 Jan. 1860, England ceded to Nicaragua absolutely the protectorate over the Mosquito coast.

Walker's Campaign.—While the diplomacy of the government of the United States was in the main considerate and helpful at this time, the conduct of some of her individual citizens left much to be desired. San Juan del Norte, or Greytown, was bombarded by the United States sloop-of-war Cyane, and burned to the ground by a landing party from that vessel, on 13 July 1854, the excuse offered for this violence being an alleged insult to the United States minister to Nicaragua. William Walker, a native of Nashville, Tenn., of Scotch descent, sailed from San Francisco, Cal., 4 May 1855, on the brig Vesta, with 58 men, to take part in the little wars of political factions in Nicaragua. Before long he found himself at the head of a considerable force composed of Americans, European adventurers, and natives, with whose aid he became master of the situation, forced the people to elect him to the presidency, and was inducted into office 12 July 1856. Attacked by the combined forces of Salvador, Costa Rica, Guatemala, and Honduras, he was obliged to capitulate. Returning in 1860 with another filibustering expedition (this time landing at Trujillo on the coast of Honduras), he was captured, tried by court-martial, sentenced to death, and executed.

Renewal of the efforts to achieve Central American unity was due in a measure to President Barrios of Guatemala (1873-85). For the further development of this design; the attempt (1895-8) to unite Honduras, Nicaragua, and Salvador; the treaty of 20 Jan. 1902, mentioned above, and events of the years 1885 to 1903, we refer our readers to separate articles on each of the five republics.

Mountain System.—The mountains described as extending directly at right angles to the cordilleras of North and South America are part of a great Antillean system. East and west mountain ranges of this type occur in the Isthmus of Panamá, Costa Rica, and the eastern parts of Nicaragua, Honduras, Guatemala, and the adjoining provinces of Mexico; also along the Colombian and Venezuelan coast of South

CENTRAL AMERICA

America, and in Cuba, Haiti, and the other islands of the Greater Antilles. Two submarine ridges stretching across the Caribbean Sea, between Honduras and the Sierra Maestra range in Cuba, and from Cape Gracias á Dios to Jamaica, are regarded as being genetically a part of the same system. The interesting suggestion is made by Mr. Robert T. Hill that the Caribbean lands before the close of the Tertiary period were much more extensive than now. "Geological surveys," he says, "have proved that during this time of expanding Antillean lands, the Gulf Stream flowed out from the American Mediterranean as now, but through a passage across the northern half of Florida. . . . The great banks of the western Caribbean Sea were at that time projections of land probably connecting Central America with Jamaica and possibly Cuba." Therefore Florida, the Bahamas, the Antilles, and at least the eastern part of Central America, totally severed from North and South America, together formed either one great island, or, more probably, a group of several large islands, with volcanic chains on the east and west (see CARIBBEAN SEA), and with characteristic rocks, calcareous and igneous, which have weathered into soils of unsurpassed fertility (see CUBA).

Volcanoes.—A Central American group of volcanoes, with 31 active craters crossing the western ends of the Antillean folds, occurs on the Pacific side of the republics, from Costa Rica to Guatemala. The central and eastern region is shown by the observations of Mr. P. W. Chamberlain, member of the American Society of Civil Engineers, to be well watered, with comparatively low mountains, very rich soil, and a good climate—except the Caribbean coast which, from Trujillo downward, including the Mosquito territory, is hot and insalubrious. Lack of communication and means of transportation has led to the abandonment of the intermediate lands, the most attractive and extensive part of the country, nearly or quite beyond the influence of the volcanic area. The easily approachable volcanic strip (in Nicaragua, for example, between the lakes and the Pacific) has been preferred hitherto as a place of residence. Thus one who visits only the principal cities in the centre of population, seeing nothing of the naturally richer and better districts, receives the impression that this is the most volcanic region of the globe. The largest volcanoes are in the north—for example, the Acatanango, 14,000 feet elevation, in Guatemala, and in the south—for example, the Irazú and Turealba, of 12,000 feet, in Costa Rica. In Nicaragua the highest, El Viejo, is only 5,800 feet above sea-level. In Guatemala we find the volcanoes, Fuego, Cerro Quemado, El Chato, etc.; in Salvador, Ilopango, San Salvador, and others. Earthquake shocks in the republics last mentioned, and also in Costa Rica, have been, as a rule, very severe, while those of Nicaragua are comparatively mild in force and extend over limited areas. The recorded seismic disturbances that have affected the whole country are those of 1538, 1648, 1651, 1844, and 1865. Central Nicaragua, east of the lakes, Nicaragua and Managua (the largest bodies of fresh water in Central America) is regarded as nearly immune from such disturbances. Nicaragua's centre of volcanic activity is a ridge, the Sierra de los Morabios, between the Cosigüina (whose out-

burst on 2 Jan. 1835 was considered the grandest on record before the eruption of Krakato in 1883), and the Momotombo. In this ridge are 10 vents, two of which, the Telica and Momotombo, are active, and none can be properly called extinct. Southeast from the Morabios ridge is the isolated active volcano Masaya. The Orosé is in Costa Rican territory. The island of Ometepe in Lake Nicaragua has two volcanoes, one dormant, the other extinct. Comparatively few members of the Central American chain of volcanoes are of the type with which fierce eruptions are commonly associated; moreover, the fertility of the soil on their flanks, due to the high percentage of soda and potash contained in volcanic dust, tempts agriculturists to remain in this neighborhood. It will be noted with interest, also, that the proposed line of the intercontinental railway keeps near to the Pacific coast. It is probable, therefore, that for many years yet to come the best part of Central America—the central districts—will receive only secondary consideration, remaining comparatively undeveloped.

Intercontinental Railway and Isthmian Canal.—Two subjects of great importance to this region are: (1) The plan to connect the railway systems of North and South America at the Isthmus of Panamá, so that the political and commercial capitals of all, or nearly all, American republics may be closely united by land routes. (2) The proposed shortening of the highways of the sea between the same nations by the construction of a ship canal (see ISTHMIAN CANALS). An all-rail route from New York to Buenos Ayres would be approximately 10,471 miles in length, of which about 5,000 miles remain (1903) to be constructed. The first International American Conference (1889-90) recommended the construction of the railroad necessary to join existing lines and give through rail communication; President Harrison approved the project (in a message, 19 May 1890); engineers were put in the field to make surveys, which were completed in 1895; in March 1903, a commissioner from the United States was sent to the Central and South American countries to ascertain the condition of lines in operation and the prospect for the completion of the undertaking. As shown by surveys published in 1902, the line will join an extension of the Mexican railway system on the northwestern frontier of Guatemala; it will have 230 miles in Guatemala, 220 in Salvador, 70 in Honduras, 224 in Nicaragua, and 363 in Costa Rica; in South America it will follow the curvature of the Pacific coast, though not closely, to Cuzco, Peru; and, in combination with the extensive systems of Argentina and Chile, will connect the Sierra of Bolivia with the southern capitals, Santiago and Buenos Ayres, with extensions to Rio de Janeiro and Asuncion. At present the principal railway lines in Costa Rica, Guatemala, and Honduras run from the interior to the ports. Guatemala leads, with 342 miles of railroad, Costa Rica has 222, Nicaragua 176 miles, Salvador 132 miles, and Honduras 50 miles. Such is the lack of transportation facilities between the countries of Spanish-America, a letter or express package from one of the Central American states, or even North America, intended for some of the South American republics, is sent first to Europe, to be forwarded to its destination; but the region now so isolated will lie at

CENTRAL AMERICA

the crossroads of two great routes of traffic in the future.

Races.—Mr. H. H. Bancroft is authority for the statement that the most numerous class of the population in Central America, next to the pure Indians, are the *ladinos*, most of whom are half-breeds, including mestizos (the offspring of white and Indian), mulattoes, quadroons, octo-rooms, and zambos (or sambos—the offspring of Indian and negro). “The *ladino* class furnishes the domestic servants, mulcteers, small farmers and tenants, herdsmen, and not a few beggars and robbers. . . . A considerable number of *ladinos*, however, become mechanics and traders, and many have attained high positions in the Church and the state, and become distinguished for their talents and abilities. The zambos and other mixtures of the negro race reside in the coast districts,” doing the heaviest work. The Caribs, who have increased greatly in numbers since they were transported from St. Vincent by the British, are more active and industrious than the sambos. Salvadoran society, according to the same authority, has a small proportion of whites, while the mass of the population is Indian, *ladino*, and zambo; in Guatemala he found (1883) that the Indians numbered 750,000, *ladinos* or mestizos 430,000, white persons 10,000, negroes 8,000, and foreigners 2,000; in Honduras that “the amalgamation of races has almost obliterated the line distinguishing whites from blacks.” In Costa Rica, on the other hand, the inhabitants are mainly white, and to a large extent descendants of Spaniards from Galicia, the Indians being distinct from the civilized race, and the negroes living almost exclusively on the coast.

Comparative Statement of Area, Population, Commerce, Imports, and Exports, etc.—The following comparative statement of the commerce, imports and exports, and interior developments of the five republics is based upon the latest complete statistics, equally representing all of the countries, that are now available—those for the year 1901:

I. Costa Rica: Area 22,000 square miles, population 310,000. Imports during 1901 were valued at \$4,410,422.45, while the exports rose to \$5,583,197.91, giving an excess of exports over imports of \$1,172,775.46. Coffee exports reached a total value of \$2,823,291.32, and bananas were shipped valued at \$1,532,581.78 (nearly 4,000,000 bunches). Gold coin and bullion exported aggregated \$682,409.23. Importations from the United States amounted to \$1,946,726, while exports to that country for the same period aggregated \$2,990,550. In the trade for 1900 and 1901 the United States shared to the extent of about 50 per cent in the import lists of the republic, as against 43 per cent in 1899, Germany's trade having fallen off one and a half points, while that of Great Britain advanced from 19.6 per cent to 22.6. Two issues of bonds were authorized during the year, the proceeds to be used in developing the railway interests of the country. On the other hand, Costa Rican bonds to the value of 642,300 *colones* (a *colon* equals \$0.465 in United States gold or silver) were incinerated, having been issued in 1897 and 1899, and subsequently redeemed. A commercial treaty with France, providing for the reciprocal exchange of tropical products between Costa Rica, the French colonial possessions, and France, at the lowest rate of customs duties, was signed by

representatives of the two countries interested on 7 June 1901, at San José. Trade conditions being reported as unfavorably affected by the decline in the price of coffee in foreign markets, a law abolishing the export duty on that article became operative on 1 Sept. 1901. According to a governmental decree, import duties on foreign goods brought into the republic were raised 50 per cent after 28 April 1901. A rapid development in the tobacco industry was noted. The net earnings of the Costa Rica Railway Company were sufficient to meet the interest on the capital invested, and to increase the reserve fund. In March the circulation of 30,000 *colones* was authorized by presidential decree. These gold coins were made at the United States mint in Philadelphia.

2. Guatemala: During 1901 Guatemala exported to the United States products valued at \$3,512,445, as compared with \$2,402,978 in 1900. The imports from the United States were worth \$1,424,814, while in the previous year they were worth only \$785,462. The tariff schedule of 1900 continued in force during the first six months of 1901. Certain exemptions were, however, made in favor of imports from the neighboring republics of Salvador, Honduras, Nicaragua, and Costa Rica. A reduction of 30 per cent, provisionally granted in the customs tariff to merchandise imported from Europe and the United States, was extended for another period of six months. On 12 Aug. 1901 a decree was issued by the government providing that the duty of six *psos* (Guatemalan *peso* equals \$0.361) per quintal on coffee exported from the republic should remain in force until 30 June 1902. The crop of 1901 was estimated at 480,000 quintals. A decree in January 1901 authorized the appointment of four teachers, two men and two women, who should be sent to the United States at the government's expense for the purpose of studying the methods of instruction in that country. With a view to the proper exploitation of the forest lands, special regulations were enacted. The president of the republic, in his annual message to the national Legislative Assembly at the opening of its regular session in 1901, noted the improvement in public highways, the development of agriculture, and in general the moral and material advancement of the country. In January definite steps were taken for the completion of the Northern Railway, which will be of great benefit in the development of Guatemala's latent resources, and to this end a contract was made with the Central American Company. The government of Guatemala proposed, as a guaranty for the cost of construction, an issue of 6 per cent gold-bearing bonds to the amount of \$4,000,000, redeemable within 10 years, the road and rolling-stock to become eventually the property of the government. A contract was entered into (April 29) between the government and the Guatemala Central Railroad Company for the extension of the Patulul branch of that road, to connect the Guatemala Central and the Occidental Railroad, thus placing the capital in direct communication with the northern and western provinces. A tramway between Guatemala city and Guarda Viejo was authorized, the concession including the free importation of the necessary cars. To prevent mining monopolies, the national Legislative Assembly prohibited the holding of more than one mine by one individual in his own name, or of more

CENTRAL AMERICA

than three mines by any corporation of three or more members. The area of Guatemala is 47,810 square miles; its population in 1897 was 1,501,145.

3. Honduras (British): Area 8,000 square miles; has about 32,000 inhabitants. See BELIZE; HONDURAS (British).

Honduras (Republic of) has an area of 46,400 square miles. Population 543,741. In the fiscal year 1901 the exports of Honduran products to the United States were valued at \$1,258,317, as compared with \$688,606 in the preceding year, while the imports from the United States in the same years were valued at \$1,115,009, and \$1,181,453, respectively. Other countries furnishing imports were: Germany, to the value of \$486,373, England \$471,650, France \$101,855, British Honduras \$152,800, other Central American states, \$107,402. Leading exports: Precious metals, \$2,279,115.50; fruits, \$1,945,388; cattle, \$557,316; coffee, \$275,193; cabinet woods, \$274,255; tobacco, \$213,423; hides and skins, \$182,345; indigo, \$107,365; sundries (hats, wheat, salt, etc.), \$177,503. Seventy per cent of the exports were taken by the United States, Germany and the Central American republics dividing the balance. Exports exceeded imports by \$2,014,000. Net government receipts from all sources, \$3,017,273.40; expenditures, \$2,840,397.21. Payments on the national debt during the year, \$805,144.73, leaving the total indebtedness of the republic at the beginning of 1902, \$1,285,207.75. The coinage of 1901 exceeded that of 1900 by \$1,948.52. During the year 2,999 ships (total capacity, 491,199 tons) entered the ports. These vessels brought 5,168 passengers, and carried away on their outward voyages 3,928 passengers. Exports of ores from the mines amounted to \$470,293.50 more than in 1900. The quantity of mail handled by the post-office service was greater than in the previous year. The telegraph system was extended by 120 miles of additional wires, making the total length of the telegraph lines 3,166 miles. During 1901 the number of messages sent was 543,599, or 31,045 more than in 1900. A report of the secretary of war presented to the national congress showed the total strength of the army to be 40,079 men. Subjects of national importance were: the canalization of the Patuca River, the systematic culture of rubber, and the construction of a line of railway from Omoa to the Bay of Trujillo—the concessionaires in the matter of the railway being citizens of the United States.

4. Nicaragua: Area, 40,000 square miles, population, 360,000. Exports to the United States in 1901 were of the value of \$2,035,036, as compared with \$1,520,266 in 1900. Imports from the United States were of the value of \$1,482,194 and \$1,817,869 in 1901 and 1900 respectively. Total foreign commerce of the republic in the year 1900: imports, \$2,487,952; exports, \$2,836,557. In 1901 Managua was made headquarters of the German consul-general, who exercises control over German consulates in Salvador, Honduras, and Costa Rica. At the close of 1900 the total debt of the republic was approximately \$4,000,000, of which \$2,666,000 represented internal indebtedness, and about \$1,334,000 the foreign debt. During the year the government floated a loan of \$451,000, the bonds being purchased by local merchants and busi-

ness men. A treaty of reciprocity between Nicaragua and Chile provided for the free admission of certain articles at the ports of those countries. With a view to developing trade relations with Spain, a special exhibition of Spanish products was established at Managua in the National Museum. The work of connecting the eastern and western railway systems was continued; a syndicate of citizens of the United States undertook to build cart-roads to certain mines, and purchased the exclusive rights of navigating the largest river in Nicaragua, the Segovia; a concession for a railway from Matagalpa to the head of navigation was granted to a citizen of the United States; a concession was granted to a company for the establishment of a line of steamships, to run between the Caribbean ports, and carry the mails between Bluefields (formerly written Blewfields) and New Orleans; a dock to cost \$150,000 and to be built at Corinto was contracted for, and the government also granted a concession for the establishment of a thread and cloth mill. Increased attention was given to the cultivation of the rubber-tree, the only important agricultural industry of the Caribbean coast country having been until recent years the growing of fruits, principally bananas. There was but one large manufactory of sugar.

5. Salvador: In order to improve the interstate relations of the republics of Central America, a session of delegates from the various countries was held in the city of Salvador in February 1901, at which it was agreed that the products of the states there represented should enjoy reciprocal free entry. The exports in 1901 included 326,588 sacks of coffee, worth \$8,308,466 in silver. Other products exported were of the value of \$2,647,579, silver. Imports during the same period were valued at \$2,615,150.64, gold, which, with exchange at 150 per cent, equals \$6,537,876.60 silver. Exports to the United States in 1901 were worth \$1,037,715, as compared with \$738,074 in 1900. Imports by Salvador from the United States in 1901 were valued at \$738,722; in 1900 they were \$679,440. At the beginning of the year 1901 the republic of Salvador was reported to be entirely free of foreign debt, bonds covering such indebtedness having been redeemed and destroyed in November 1900. Receipts from taxation in 1901 were: Customs duties, \$4,168,564.59; tax on liquors, \$1,814,761.99; sundry taxes, \$315,283.14; telegraphs, post-offices, etc., \$258,111.84; total, \$6,556,721.56. To this sum there must be added \$1,133,958.17 (from deposits, licenses, etc.), which, added to the balance on hand at the beginning of the year, makes the total receipts \$7,825,764.40. Disbursements in 1901 were: Legislative, executive, and judicial branches of government, \$4,378,948.31; payment of different credits, \$3,197,956.09; return of deposits and other expenditures, \$63,986.77; balance 31 Dec. 1901, \$184,873.23; total \$7,825,764.40. The public debt on 31 Dec. 1901 was \$8,325,904.43. Salvador's area is 7,255 square miles; its population, according to the census of 1901, was 1,106,848.

MARRION WILCOX,
Authority on Latin-America.

Central City, Colo., a city and county-seat of Gilpin County, situated on the Union P. R.R., 20 miles southwest of Boulder. It lies in a gold-mining district of the Rocky Mountains and its industries are chiefly connected with the development of the mines, which have been worked for about half a century. Pop. (1900) 3,114.

Central College, a coeducational institution in Payette, Mo., organized in 1857, under the auspices of the Methodist Episcopal Church South; reported at the end of 1902: professors and instructors, 10; students, 201; volumes in the library, 6,500; value of all property, \$320,000; acting president, T. Berry Smith, A.M.

Central Falls, R. I., a town in Providence County, situated on the Blackstone River, and the New York, N. H. & H. R.R., 4½ miles north of Providence. It has a number of large manufacturing establishments, with an aggregate capital of \$3,389,000, including cotton, woolen, silk, and leather factories. The river supplies excellent power. There are several churches, newspapers, and a national bank. Pop. (1900) 18,167.

Central Force, a force which constantly urges the body upon which it acts toward the same fixed point or "centre." Central forces are specially important in physics and mechanics, because systems in which the forces are all of this character are "conservative." See DYNAMICS; ENERGY, CONSERVATION OF.

Central India Agency, the official British term for a collection of states in Hindustan, consisting of four groups or agencies, namely, Bundelkhand, Bhaghelkhand, Gwalior, and Ni-

mar and Malwa, covering an area of 77,808 square miles, under the ultimate charge of the governor-general's agent at Indore. The largest individual states are Gwalior, Indore, and Bhopal. Pop. (1901) 8,501,883.

Central Park, the most noted park in New York city. It contains 840 acres and extends from 59th Street to 110th Street, and from Fifth Avenue to Eighth Avenue. In 1856, the year of its purchase by the city, the land now constituting Central Park was occupied by shanties, bone-boiling establishments, piggeries, and pools of offensive stagnant water which rendered the neighborhood anything but park-like. The first full year's report of the men who were given the work of turning this ground into a park, contains the following description of its condition:

"It was already a straggling suburb, when purchased by the city, and a suburb more filthy, squalid and disgusting can hardly be imagined. A considerable number of its inhabitants were engaged in occupations which are nuisances in the eyes of the law and forbidden to be carried on so near the city. They were accordingly followed at night in wretched hovels half hidden among the rocks.

"During the autumn of 1857, 300 dwellings were removed or demolished by the commissioners, together with several factories and numerous 'swill milk and hog-feeding establishments.' Ten thousand loads of stone were also taken off the land and used to build a rough enclosing wall."

This description helps one to appreciate the vast amount of work, and artistic planning which has been necessary to bring the park to its present state of beauty and attractiveness, and it is interesting to see how fully the prophecy of a park commissioner, who wrote in 1868, has been fulfilled:

"But we who are in the middle of life," he says, "can never know all its beauty. That is reserved for those for whom we have planted these shrubs and trees, and spread these level lawns. These trees will arch over many happy generations, and thousands who are not yet born will enjoy the sweet green of the grass; and it will ever habitually serve to keep the memory of its founders green."

The central site was finally selected despite its unpromising topography, in preference to the one first proposed at 66th Street on the East River—the Jones' Wood site—because it was central and spacious. It was also thought that the great expense of turning it into building lots—the extensive filling of low, swampy ground, and blasting away of ledges—would enable the city to purchase the land at a low figure. Including a number of acres of water surface, comprising the two reservoirs belonging to the Water Department, the cost was about \$7,500 an acre. The total acreage, including the subsequent extension to 110th Street, was 843, and the price paid \$6,348,959.90.

There has been spent in bringing the park to its present condition somewhere between \$25,000,000 and \$30,000,000.

The special committee appointed by the Board of Aldermen to select the most desirable park site pronounced emphatically in favor of "the Central Park," stating their opinion that "it could be made to compare favorably with

CENTRAL PARK

the most celebrated public grounds of the chief cities of Europe, not excepting Hyde Park of London, the Champs Elysées of Paris, the Prater of Vienna, the Cascine of Florence, the Corso of Rome, the Prado of Madrid, or even on the American continent, with the spacious plazas of Havana or the lovely botanical gardens of Rio de Janeiro."

It was freely predicted by the opponents of the park that it would prove a white elephant on the hands of the city; that it could never be made into a decent-looking park, and was an unnecessary extravagance which the city did not need and could not afford.

The largest settlement of the park seems to have been along the Eighth Avenue side. Mount St. Vincent was included within the park borders, situated just west of Fifth Avenue at 105th Street, on the old Boston post road, which ran diagonally through the park. The land and buildings (now the headquarters of Commissioner Wilcox) forming the State arsenal, were subsequently purchased by the city and added to the park in 1867, the price paid being \$275,000.

Owing to the lack of funds no work was done in improving the land until 1857. In April of this year the legislature authorized the issuance of bonds and in the following June a tentative beginning was made on the park. Preliminary surveys had been carried out by Egbert L. Viele, the first engineer to the commissioners, but they soon decided that it would be desirable to offer a series of prizes to outside architects for designs for the formal laying out of the land. In 1857 such an announcement was made and on April 1, 1858, 30 designs were submitted. That of Messrs. Olmsted & Vaux was chosen, and they were awarded the first premium of \$2,000. In 1857 Mr. Olmsted had been appointed superintendent to the board; George E. Waring, agricultural engineer; Samuel I. Gustin, nurseryman, and several other landscape offices had been created and filled.

In 1858 Mr. Olmsted was promoted to architect-in-chief at a salary of \$2,500 a year, and the other offices abolished or subordinated to his.

The work of putting the successful design into execution was begun by Mr. Olmsted, Calvert Vaux, and J. W. Mould in June 1858. The original plan has been pretty closely adhered to, during the 40 odd years of the park's existence, although there have been times when strong efforts were made to alter it, and even to remodel some of the previous work. In 1871 when the Central Park commissioners were legislated out of office, and a board of public parks for the whole city instituted, such an attempt was made, one of its features being an extensive thinning of the trees.

Until 1871 the history of the park was an uneventful one. Most of the commissioners had served on the board since its first year, and except for family squabbles over the details of management and construction, the improvements were carried on without interruption practically in the entire charge of Mr. Olmsted. The difficulties which began to interfere with the efficiency of the department after its political organization in 1871 are indicated by the following extract from a pamphlet by Mr. Olmsted, who was subsequently made a commis-

sioner and president of the board shortly prior to his dismissal:

"As superintendent of the park," he says, "I once received in six days more than 7,000 letters of advice as to appointments, nearly all from men in office." Delegations from various political organizations came to find out "what share of his patronage they could expect," and in order to make him as little trouble as possible in its parceling out "they took the liberty to suggest that there could be no more convenient way than that you should send us our due quota of tickets, if you please, sir, in this form, leaving us to fill in the name." Here a pack of printed tickets was produced, which proved to be blank appointments, bearing the signature of Mr. Tweed. "That," continued the spokesman of the delegation, "was the way we arranged it last year, and we don't think there can be anything better."

There seems to have been some misconception, during the early years of the park, as to its real purpose, and considerable jealousy of its regulations. In April 1864, for instance, one of the regiments of the first division of the National Guard, despite the vehement opposition of the park keepers, marched through one of the gates and proceeded to drill upon the green. Another regiment subsequently attempted to do the same thing.

An interesting item in the report for 1863 is the announcement that 14 European sparrows, "*moincau* of France," were let loose in the park in the spring of that year. This original 14, apparently the pilgrim fathers of the present local settlement, must now be represented by several million.

The paving of Fifth Avenue up to the park was completed in 1863. Previous to this, especially in wet weather, the approaches had been extremely bad, and the completion of the Fifth Avenue paving led to an immediate increase in the use of the park for driving. In its early days guards were stationed at each of the park gates, and a part of their duty was to count the number of persons passing in. In 1861 the result of the count was 1,863,263 pedestrians, 73,547 equestrians, and 456,849 carriages, the total number of visitors being estimated at 2,404,659.

"For the purpose of ascertaining the nature of the existing vegetation," says the first annual report (1857-8), "a botanical survey of the park has been made. First, to learn how far it can be made available in the projected improvements and to ascertain what plants will prove most flourishing if transplanted to this ground, and second to discover what alterations the soil will require in order to admit of an increased variety."

This report details about 70 species of trees, shrubs, and vines. Among the trees were included maples, beech, dogwood, chestnut, catalpa, red birch, persimmon, ash, locust, black walnut, red cedar, sweet gum, sycamore, poplar, American aspen, oak, and elm. All told, there were about 150,000 trees and shrubs.

Regarding the present vegetation there seems to be no available data, no continuous record of the planting having been kept nor any detailed botanical study of it made during recent years.

The soil of the park was never good in quality, nor abundant enough to support the veg-

CENTRAL PROVINCES — CENTRE OF BUOYANCY

agation of a park. For this reason the public had to be excluded from the meadows and lawns, as a single day's trampling of the grass nearly destroyed it. In 1903 a systematic renovation of the soil was undertaken, and continued until nearly the whole planted area was covered with loam, carted from Long Island, at an expense of upward of \$2,000,000.

Central Provinces, a part of British India, presidency of Bengal, occupying a position about the middle of the peninsula. Their total area is computed to be 115,936 square miles, of which 86,617 square miles are British territory, and the rest the territory of native protected states, 15 in number. They contain much waste land and jungle and the cultivated area is small, little more than one fourth of the British territory being turned to account, and more than one half of the remainder being uncultivable. The district of Nerbada is admirably adapted for the cultivation of the sugarcane, of cotton, and of wheat, and it contains coal and iron. Nagpur has extensive cotton fields, contains the celebrated cotton market Hinganghat, and the valley of the Wainganga, farther east, grows maize, wheat, and rice. The most important manufactures are weaving and working of iron ore. These provinces became a separate administration in 1861, and are under the authority of a chief commissioner. For administrative purposes they are divided into four commissionerships, Jabalpur (Jubbulpore), Nagpur, Nerbada (Nerbudda), and Chhattisgarh (Chutteesgarh), and these contain 19 districts.

Central University, a co-educational institution in Pella, Iowa, organized in 1853, under the auspices of the Baptist Church; reported at the end of 1901: professors and instructors, 15; students, 83; volumes in the library, 5,000; grounds and buildings valued at \$60,000; productive funds, \$24,000; benefactions, \$1,500; income, \$5,350; president, Asa B. Bush, Ph.D.

Central University of Kentucky, a co-educational institution at Danville, Ky., under the auspices of the Presbyterian Church. It was given its present organization in June, 1901, by the consolidation of the Centre College of Danville (founded 1822) and the Central University of Richmond (founded 1874). Number of instructors reported, 107; number of students, 1,205; volumes in the library, 25,000; total value of property, \$1,500,000; president, W. C. Roberts, D.D.

Central Wesleyan College, a co-educational institution in Warrenton, Mo., organized in 1864, under the auspices of the Methodist Episcopal Church; reported at the end of 1902: professors and instructors, 18; students, 294; volumes in the library, 7,000; grounds and buildings valued at \$100,000; productive funds, \$70,000; income, \$10,300; president, George B. Addicks, A.M.

Centra'lia, 'Ill., a city of Marion County, situated on the Illinois Cent. R.R., and several other railroads, 105 miles north of Cairo. It is in a fruit-raising and mining region and is largely occupied in iron and steel workings. The city has several parks and a public library. Pop. (1900) 6,721.

Centraliza'tion, the placing in the hands of a central government jurisdiction over matters which might be under the management of

local authorities. The term is used to denote the increase of power of a central authority already established, or the closer union under a central power of a confederation of partially independent States. The adoption of the Constitution of the United States was centralization in the latter sense. The question of centralization in the first sense has been an important one in United States history, forming the point of dispute between the first two political parties, and being a frequent subject of discussion at all times. The question as applied to the United States is whether to interpret the Constitution liberally, and give the national government power in doubtful cases; or whether to put a close construction on the Constitution and give the States the benefit of the doubt.

Centrarchidæ, sën-trar'ki-dë, a family of fresh-water percoid fishes, confined to North America. The body is generally short, deep, and compressed, with an equal curvature above and below, and covered with rather large, strongly ctenoid scales. The mouth is terminal, variable in size, with the premaxillary protracile, and numerous fine, close teeth on all of its bounding bones. Both dorsal and anal fins are long, with 6 to 13 strong, sharp spines in the anterior part of the former, and 3 to 8 in the latter. All are active, pugnacious, carnivorous fishes, many of which build nests. They are important game and food fishes of small or moderate size, of which about 12 genera and 30 species are known, almost all of which are confined to the Mississippi valley and the eastern United States, where they are almost the most characteristic fishes. The most important are the grass bass, black bass, rock bass, warmouth, and sunfishes (qq.v.).

Centre, a point equidistant from the circumference of a circle or from the superficies of a sphere; also the middle point of any superficies or solid.

Centre-board, a contrivance used in a yacht or shallow, keelless, or flat-bottomed vessel, to counteract the tendency to make leeway and to enable the craft to stand up under press of sail. It consists generally of a quadrangular wooden or iron plate which is bolted or hinged by its lower forward corner into a trunk or casing which fits, water-tight, over a fore-and-aft slot in the vessel's bottom, about midway of her length. When running before the wind or in shallow waters the centre-board is hauled up inside the trunk. When on a wind, or with the wind abeam, the centre-board is lowered, presenting a broad surface to the water on the same principle as a lee-board (q.v.). The term centre-board is essentially American; elsewhere the contrivance is known as a sliding-keel. See YACHT AND YACHTING.

Centre of Buoyancy. The pressures which act on every point of a surface immersed in a fluid can be resolved into horizontal and vertical components. The former balance each other. The resultant pressure must therefore be vertical; and, as the pressure increases with the depth, it is clear that the upward pressures must be greater than the downward. Hence the resultant pressure on an immersed body must be a force acting vertically upward. It is easily shown that the magnitude of this pressure is equal to the weight of the fluid displaced. The

CENTRE COLLEGE — CEO

point in the displaced fluid at which the resultant vertical pressure may be supposed to act is called the centre of buoyancy, or centre of displacement. Hence, we see that when a body floats in a fluid it is kept at rest by two forces, the weight of the body acting downward through its centre of gravity, and the weight of the fluid acting vertically upward through its centre of gravity or centre of buoyancy. The relative positions of the centre of gravity and the centre of buoyancy have an important bearing on the safety of ships at sea. If the centre of buoyancy be above the centre of gravity, the equilibrium is stable; in other words, if the ship is displaced, it will tend to return to its original position. If, on the other hand, the centre of buoyancy be below the centre of gravity, the equilibrium will generally be unstable, although a body may float in stable equilibrium even if the centre of buoyancy be below the centre of gravity.

Centre College, Danville, Ky. See CENTRAL UNIVERSITY OF KENTUCKY.

Centre of Gravity, or **Centre of Inertia**, a point in a body, or in a system of bodies, which in modern works on mechanics is usually and preferably called the "centre of mass." See MASS.

Centre of Gyration. See PENDULUM.

Centre of Inertia. See CENTRE OF GRAVITY.

Centre of Oscillation. See PENDULUM.

Centre of Percussion. See PENDULUM.

Centre of Population, the centre of gravity of the population of a country, each individual being assumed to have the same weight. The centre of population in the United States has clung to the parallel of 39° lat. and has moved in a westward direction during the last 110 years. The following table shows the movement of the centre of population since 1790:

Years Census	North Latitude	West Longitude
1790	39° 16.5'	76° 11.2'
1800	39 16.1	76 56.5
1810	39 11.5	77 37.2
1820	39 5.7	78 33.0
1830	38 57.9	79 16.9
1840	39 2.0	80 18.0
1850	38 59.0	81 19.0
1860	39 0.4	82 48.8
1870	39 12.0	83 35.7
1880	39 4.1	84 39.7
1890	39 11.9	85 32.9
1900	39 9'36"	85 48'54"

Centre of Pressure. See HYDROSTATICS.

Centreing, or **Centering**, the framing of timber by which the arch of a bridge or other arched structure is supported during its erection. See BRIDGE.

Centrifugal Force, a force which continually tends to fly from a given fixed point or centre; opposed to centripetal force (q.v.).

Centrifugal Machines, machines used for various purposes, in which centrifugal force produced by rapid revolution is utilized. Such a machine may be used for drying clothes or other goods, the articles being placed inside a hollow cylinder made of wire-gauze or with numerous perforations in its circumference,

which, being driven at a high speed, the moisture is caused to fly off by centrifugal action. Sugar is now often separated from the molasses by a centrifugal machine, the product being commonly known by the trade name of "centrifugal sugar." The cylinder in which the sugar is contained is placed within a larger cylinder in which the molasses is received. Liquids such as beer, can also be clarified and cleared of foreign substances by means of centrifugal action, the extraneous matters being made to collect at the circumference of the vessel through the high rate of speed at which it is driven, while the clear liquid can be drawn off by an outlet at the centre. Cream is now commonly separated from milk in large dairies by the same method. See BUTTER.

Centripetal Force, a force which tends continually toward a given fixed point, or centre; a "central" force. See DYNAMICS; ENERGY, CONSERVATION OF.

Centumviri, judges of ancient Rome, three from each tribe, who determined ordinary causes. The extent of their jurisdiction is uncertain. Hollweg would confine it to civil cases; it seems probable that they at first handled questions relating to quiritarian ownership, which determined the status of the citizens.

Centuries of Magdeburg, a history of the early Christian Church, so called because it was divided into centuries, each of the 13 volumes containing a hundred years, and was first written at Magdeburg. Matthias Flacius formed the plan of it in 1552, but the last volume did not appear until 1574. It is the first comprehensive work of the Protestants on Church history; its main purpose was to prove the agreement of the Lutheran doctrine with that of the primitive Christians, and the difference between the latter and that of the Roman Catholics.

Centurion, a Roman army officer who commanded a century, or body of 100 men. The rank of a centurion corresponded very nearly to that of a captain in modern armies. See LEGION.

Centuripe, chên-too-rê'pā, Sicily, a town in the province of Catania, situated on a height above the valley of the Simeto, 20 miles northwest of Catania. It is situated in a district yielding soda, sulphur, and marble. The ancient city (Centuripa), considerable ruins of which exist, was at one time among the important cities of Sicily. Pop. 11,000.

Century, in chronology, a period of 100 years. Modern chronology of Christian nations centres at the birth of Christ, and the centuries are numbered according to their order either before or after that event, for example, the 20th century A.D., the 4th century B.C.

In Roman times, (1) a division of 100 men in the army, corresponding to the modern company, 60 of which formed a legion; (2) a division of the six classes of the people, introduced by Servius Tullius, for the purposes of taxation and voting.

Century-plant, a popular name of the *Agave americana*, or American aloe. See AGAVE.

Ceo, *Violante do*, vē-ō-lān'tā dō thā'ō. Portuguese poet: b. Lisbon 1601; d. 1693. She was styled "the tenth Muse." Her 'Portuguese

CEORL — CEPHALONIA

Parnassus' and miscellaneous poems are greatly admired.

Ceorl, chér'l. See CHURL.

Ceos, sē'ōs, or **Kea**, kā'a (sometimes called by the Italianized name of *Zea* or *Tzia*), an island in the group of the Cyclades, in the Ægean Sea, 13 miles off the coast of Attica. It is 13 miles long, 8 broad and 39 square miles in area. The central and culminating point is Mount Elia: 1,863 feet high. It is fairly fertile, raising fruit, wine, honey, and valonia. In ancient times Ceos was noted as the birthplace of the poets Simonides and Bacchylides, and the physician Erasistratus; and the Cean laws were famous for their excellence. The capital is Ceos.

Cephaelis, sēf-a-ē'lis, a genus of plants belonging to the order *Rubiaceæ*, natives of tropical America. The roots of *C. ipecacuanha* furnish the commercial drug of that name. See IPECAC.

Cephalaspis, sēf-al-ās'pīs, a genus of ostracoderms (q.v.) of the Devonian Period, characterized by a semicircular or semioval head-shield, with spines at the angles. It has a curious superficial resemblance to the head-shields of certain trilobites.

Cephalization, sēf-a-lī-zā'shūn, a principle advanced by Dana, who claims that cephalization is simply domination of the head—cephalic domination—in an animal, as manifested in the structure; and any degree of it depends on the grade or power of the cephalic centre and the degree of subordination to it in the structure. He agrees that since animals have a head as their grand characteristic feature, and a brain as the fundamental element of the head and the prime centre of force in the organism, exaltation and concentration anteriorly of the life-forces mark a high grade of cephalization. Their concentration of parts anteriorly, with exaltation of the cephalic end of the body, is manifested not merely in the transfer of members to the cephalic series, but also in the form and structure of the head, of the sense-organs, the mouth-appendages, the legs and abdominal appendages.

The principle is most clearly shown by the increased size and specialization of the head of the crab and the corresponding reduction of the abdomen as compared with the elongated abdomen of the lobster and shrimps, as well as the relations of the head to the thoracic and abdominal regions in the amphipod and isopod *Crustacea*. It should be observed that in arthropods in general, at the beginning of embryonic life, development begins with the head, thus in *Limulus*, *Arachnida*, *Crustacea*, and insects, the head is the first to become developed; its segments and appendages arise before those of the hind body. It is so in the vertebrates, the head at first forming the bulk of the body. This is the case with annelid worms, etc., in their larva, the trochosphere (q.v.), the bulk of the body is formed by the head. It is not improbable that the cause of the large size of the head in the embryos of all the higher animals is in some way connected with the fact that development begins at the anterior end. On the other hand the new segments later in embryonic life in worms and arthropods arise at the growing-

zone, which is situated at the end of the hind body, between the penultimate and terminal segments of the body.

A. S. PACKARD,
Brown University.

Cephalochorda, sēf'a-lō-kōr'da, a group of *Chordata* (q.v.) represented by the lancelet or *Amphioxus* (q.v.). Other names for the young group are *Leptocardii* and *Acrama*. The *Cephalochorda* are fish-like in shape, and have a notochord extending the length of the body, beginning in the head; hence the name *Cephalochorda*. The notochord is situated between the nervous system and the digestive canal. The central nervous system lies entirely on one side of the digestive canal, while numerous gill-slits extend from the pharynx to the exterior.

Cephalodiscus, sēf-a-lō-dīs'kūs, a very puzzling animal now placed in the subphylum *Enteropneusta* (*Hemichordia*), along with *Balanoglossus* (q.v.). It is a deep-sea form, and at first was mistaken for a large polyzoan, which it strikingly resembles. It is like *Balanoglossus* in being divided into three regions, that is, a proboscis, a collar, and the main trunk, which is very short; but it is not worm-like in general appearance. Its place among the chordates is due to the presence of a structure resembling a notochord, with the same relations to the nervous system as in *Balanoglossus*. It differs however, from the latter animal in the possessing tentacles arising from the collar, and in the digestive canal being bent on itself as in the *Polyzoa*, so that the vent is situated near the mouth; and it has only a single pair of openings supposed to represent the gill-slits. These creatures occur in colonies, secreting a common branching case somewhat like that of *Polyzoa*, and it multiplies by budding.

Cephalonia, sēf-a-lō'nī-a, or **Kephallenia**, an island of Greece, the largest of the Ionian islands, northwest of the Morea, at the entrance of the Gulf of Patras, about 31 miles in length, and from 5 to 12 in breadth; area, 302 square miles. The coastline is very irregular and deeply marked with indentations, and the surface is rugged and mountainous, rising in Monte Negro, the ancient Ænos, to a height of 5,380 feet. There is rather a deficiency of water on the island. The principal towns are Argostoli, the capital, and Lixuri. The chief exports are currants, oil, and grain; wine, cheese, etc., are also exported. The manufactures are inconsiderable, consisting of some cottons, carpets of mixed wool and goats'-hair, with some potteries and distilleries of liqueurs. The island is subject to frequent earthquakes. One of the most destructive was that of the year 1867. The greater part of the population are of the Greek Church; the others belong to the Catholic Church. By Homer the island was called Same or Samos, though he speaks of the inhabitants as Cephalenies. The island adhered to Athens during the Peloponnesian war. In 189 B.C. it came under the Roman dominion and after the division of the empire, it became subject to the Byzantines. In the 12th century it was taken by the Normans, and afterward fell successively into the hands of the Venetians and Turks, and then again into the hands of the Venetians, who retained possession of it until 1797, when the French seized it. From 1815 it belonged to the Republic of the United Ionian Islands, and in

1864 was united with the other islands to the kingdom of Greece. With Ithaca and a few other adjacent islands it forms a nomos or province of the kingdom of Greece. Pop. of nomos 83,363; of the island about 72,800.

Cephalop'oda, a class of mollusks represented by the squid, cuttle-fish, octopus, nautilus, argonauts, etc. In these mollusks the head-lobe bears arms or tentacles, as the animal has no "foot" or creeping-disk like that of other mollusks, though its homologue is found in the siphon and tentacles. They have an unpaired muscular mantle, which forms the walls or outside, so that as in the squids, where there is no outer shell, the body is naked. The nervous system is much concentrated, for not only are the cerebral ganglia, pedal, and visceral ganglia in the head, but also the ears and osphradia, or olfactory organs. The large complicated brain, thus composed of the three primary pairs of ganglia with some accessory ones, are enclosed in a cephalic cartilage which suggests a comparison with the cartilaginous skull of the lamprey and sharks. In the body behind are the sympathetic and stellate ganglia. The eyes as a rule are highly developed, with a retina, choroid, iris, cornea, vitreous body, and lens. The gills are well developed, either as one or two pairs situated within the mantle-cavity. The water is forced from the mantle-cavity, which is open behind the head, through the siphon. There are two kinds of hearts. The systematic heart consists of two or four (nautilus) auricles receiving the blood from the gills, and a median ventricle from which arise the anterior and posterior aortæ. There is also, at the base of each gill, a branchial heart, which receives the blood from the vena cava and pumps it into the gill. These branchial hearts are not known to exist in other mollusks, and no other mollusks possess an ink-sac. The armature of the mouth, however, as in gastropods, consists of two horny teeth, enormous in most cephalopods, and an odontophore with its lingual ribbon for cutting flesh, etc. The eggs in developing undergo a superficial or discoidal development; and the young undergo no metamorphosis. The shell of cephalopods is either chambered, as in orthoceratites, nautiloids, and ammonoids, or, as in argonauts, forms a simple deep basin. In the squids and cuttle-fish the body is supported by an internal pen or "bone."

The cephalopods are divided into two orders, according to the number of their gills.

Order 1. Tetrabranchiata.—This group, in which the gills are four in number, is represented by the nautilus, the sole living representative of a number of fossil forms, such as *Orthoceras*, *Gomiatites* and *Ammonites*. *Nautilus pompilius* and *Nautilus umbilicatus* are the only survivors of about 1,500 extinct species of the order. See NAUTILUS.

Order 2. Dibranchiata.—The dibranchiates are so called from possessing but two gills, while the tetrabranchiates had, as in *Nautilus*, numerous unarmed tentacles; these are now represented by 10 (*Decapoda*) or 8 (*Octopoda*) arms, provided with numerous suckers. To the 10-armed forms belong *Spirula*, a diminutive cuttle with an internal coiled shell. The shells of *Spirula peronii* are rarely thrown ashore on Nantucket; it lives upon the high seas. The extinct Belemnites had, like the recent *Moroteuthis*,

a straight conical shell, the "thunderbolt" fossil. Allied to *Loligo* and *Ommastrephes* are gigantic cuttle-fishes which live in mid-ocean, but whose remains have been found at sea or cast ashore on Newfoundland and the Danish coast. Their jaws also occur in the stomachs of sperm whales.

Fossil Cephalopods.—The greater proportion of cephalopod mollusks are fossil. They began to exist in the Cambrian Period, and, as nautiloids and ammonoids, flourished in great profusion in the Palæozoic and Mesozoic eras, the ammonites (q.v.) of the Jurassic and Cretaceous beds numbering about 5,000 species.

Cephalula, sĕf-a-loo'la, the name applied by Packard to the stage of the embryos of mollusks and of worms immediately succeeding the gastrula (also the trochosphere) when the larva is still a surface-swimmer and the head is beginning to be formed. Consult Packard 'Life-Histories of Animals,' p. 94.

Cephalus, sĕf'a-lūs, the son of Creusa; according to some the son of Deion, king of Phocis, and of Diomedea. He was the husband of Procris, or Procene. Shortly after his marriage Eōs (Aurora) carried off the beautiful youth while he was hunting on Mount Hymettus. He refused the love of the goddess, who induced him to put the virtue of his wife to a trial which it could not withstand. Procris, in return, tempted him likewise, and he yielded also. Learning their mutual weakness, they became reconciled. But Procris subsequently became jealous of her husband, and concealed herself in a wood to watch him. He mistook her among the leaves for a wild animal, and killed her with a javelin.

Cephas, sĕf'as, a surname given by Christ to Simon. In the Greek it is πέτρος ("a rock"), in Latin *Petrus*, and in English Peter.

Cepheus, sĕf'ūs, a king of Ethiopia and husband of Cassiopeia; his name was given to a constellation of stars in the northern hemisphere, surrounded by Cassiopeia, Ursa Major, Draco, and Cygnus.

Cephis'sus, the name of three rivers of Greece. (1) A river which waters the Athenian plain. It rises on the west slope of Mount Pentelicus and the south side of Mount Parnes, and flows past Athens on the west into the Saronic Gulf near Phalerum. (2) A river of Attica emptying into the Gulf of Eleusis. (3) A river flowing through eastern Phocis and northern Bœotia and emptying into Lake Copais (Topolias).

Ceracchi, Giuseppe, joo-sĕp'pĕ chā-rā'kĕ, Corsican sculptor: b. on the island of Corsica, 4 July 1751, or, according to others, about 1760; d. Paris 29 Jan. 1801. In 1798 he took part in establishing the republic at Rome, of which he was among the warmest partisans. On the re-establishment of the papal authority he was obliged to leave Rome, and went to Paris, where he was employed in making a bust of the First Consul. Nevertheless, he joined the young French artists whom he had known at Rome, and whose ardent republican opinions coincided with his own, in a conspiracy against Bonaparte, in whom he saw only the oppressor of his country. On 9 Nov. 1800, he was arrested at the opera, with Arena, Damerville, and Topino Lebrun. Before the tribunal he answered only in

CERAM — CERAMICS

monosyllables to the questions put to him. He was sentenced to death, together with his accomplices, and ascended the scaffold with great firmness. The death of this disciple, and almost rival, of Canova, was a great loss to sculpture.

Ceram, sê-rām', or **Ceiram**, called by the natives Zeram or Serang, an island of the Moluccas, the second of the group in size, lying west of New Guinea; in the Indian Archipelago; area about 7,000 square miles. Its interior is very imperfectly known, but it is understood to be traversed by mountain ranges from 6,000 to 8,000 feet high, and culminating in Noosaheli, which is 9,250 feet. The vegetation is luxuriant and gigantic, some of the sago-palms growing 100 feet high. Sago forms the chief food of the inhabitants and is an article of trade. The inhabitants of the coast are of Malay origin, and have extensive fisheries. The interior is peopled by Alfoories or Alfuros, long known for their barbarous custom of using human skulls for public and private ornament, and the still more barbarous atrocity of committing murder in order to procure them. They are said to have become more civilized, and many of their rajahs have adopted the European dress and manners. They are divided into various independent tribes. Christianity has been introduced into several villages on the south coast, but not with any great success, though it is said that in some of the villages a considerable number of those professing Christianity can now read and write. The island belongs to the Dutch, who have established several stations there under the charge of an official residing at Wahai on the north coast. Pop. estimated at 195,000.

Cerambycidae, sê-rām-bis'î-dê, a family of beetles of great extent, readily known by their very long antennæ, which give its members the name of "longicorns." The family already numbers some 12,000 or 13,000 species, though probably not over half of the existing forms are known. It comprises some of the largest, most showy, as well as the most destructive insects of the sub-order. They are readily recognized by their oblong, often cylindrical bodies, the remarkably long, filiform, recurved antennæ, and the powerful incurved mandibles. Their eggs are introduced into cracks in the bark of plants by the long, fleshy, extensible tip of the abdomen. The larvæ are long, flattened, cylindrical, fleshy, often footless, whitish grubs, with very convex rings, the prothoracic segment being much larger and broader than the succeeding, while the head is small and armed with strong, sharp mandibles adapted for boring like an auger in the hardest woods. These borers live from one to three years before transforming, at the end of which time they construct a cocoon of chips at the end of their burrows, the head of the pupa lying next to the thin portion of bark left to conceal the hole.

The species of the American genus *Oncideres* are called girdlers, because the parent beetle, after laying an egg in a small branch, girdles this round with a deep incision, so that the portion containing the larva sooner or later falls to the ground. The growth of a longicorn larva frequently takes more than a year, and under certain circumstances it may be enormously prolonged. *Monohammus confusus* has been known to issue from wooden furniture which was 15 years old. Individuals of another longi-

corn have issued from the wood of a table 20 and even 28 years after the felling of the tree from which it was made. Watson has related a case from which it appears probable that the life of a longicorn beetle dwelling in household furniture extended over at least 45 years. It is generally assumed that the prolongation of life in these cases is due to the beetle resting quiescent long after it has completed the metamorphosis; but more probably it is the larval life that is prolonged; the larva continuing to feed, but gaining little or no nutriment from the dry wood in these unnatural conditions. A large number of longicorns stridulate loudly by rubbing a ridge inside the pronotum on a striate surface at the base of the scutellum. A few produce noise by rubbing the hind femora against the edges of the elytra, somewhat after the fashion of grasshoppers; and some possess highly developed stridulating surfaces on the hind and middle coxæ.

Ceramics. The operations of the clay worker rank among the most ancient of those undertaken by man and are, with the single exception of agriculture, the most widely spread. The origin of the art is lost, but it is quite certain that in prehistoric times the plasticity of clay had been remarked and made use of. The first clay work probably consisted of brick, and these were at first sun dried. (See BRICK.) Of sun-dried pottery but few examples remain, and the fact that such wares could not be employed to hold liquid prevented a very extensive use of unburned pieces. The knowledge that clay could be hardened and made impervious by burning must be ranked as a discovery distinct from that of shaping the plastic clay. It is not unlikely that the funeral pyre revealed the secret. Vases and jars have been found in the British barrows or tumuli which have apparently been burned only in the fire by which the body was consumed.

Clay work was originally formed by hand alone, the method followed being similar to that still practised by certain tribes of Indians. A plastic clay was worked and kneaded to render it homogeneous and was then rolled into long thin strips. These were coiled in a spiral form and the joints made good by pressure until the desired size and shape was reached. The invention of the potters' wheel marks an epoch in the history of the art and wherever the wheel became known it entirely superseded the older method. Some peoples, however, never learned of the wheel, but brought their own craft to great perfection. The wheel is of very ancient date. Dr. Birch ('Ancient Pottery') states that the Egyptians attributed it to the power of the gods. Num, the creator, used it for the formation of the human race. (See POTTERS' WHEEL.)

In modern times the wheel has given way to the mold as a means of giving shape. (See POTTERY.)

Among early workers natural clay was used and their wares are colored, the single exception being Chinese porcelain. (See PORCELAIN.) The first traces of pottery are found in Egyptian hieroglyphics, where vases, evidently wheel-made, are depicted in the writing. The vases themselves of various dates are to be found in museums and the recent excavations by Dr. Flinders Petrie have added much to our know-

CERAMICS

ledge of Egyptian work. In Babylonia and Assyria the main interest lies in the fact that clay was used as a means of writing. Clay tablets and cylinders were prepared and with angular punches the cuneiform characters were impressed. The tablet being fired the writing became indelible. Vast stores of these clay records have been discovered and are being deciphered.

In Greece the fictile art was developed in a remarkable degree. A high standard of criticism prevailed and the arts reached great perfection. Greek pottery ranges from 700 to 200 B.C. The early work was crude, almost barbaric. The clay was of a pale salmon tint deepening to a warm brown. Upon the polished surface decorative patterns were traced in black. Geometric designs occupied the attention of one section, others attempted a more florid treatment developing into silhouettes of birds and animals. The human figure eventually prevailed and scenes from mythology and local history appeared. The great change came when, instead of black figures on a red background, the figures were outlined and the background painted in black. This enabled details of feature and drapery to be executed with rare fidelity, and the culminating point of Greek pottery was reached. There are some 15,000 Greek vases in existence and the larger number of them are of superior workmanship.

The pottery of the Romans exists in great abundance, but few pieces are remarkable for excellence of workmanship. The Romans possessed an abundance of glass and the rude pottery of the household was displaced at the table of the patrician. Roman pottery is remarkable for its wide distribution. Their armies seem to have been regularly accompanied by potters. Germany, France, and Great Britain are covered with fragments of Roman wares made for the most part from local clay. A remarkable variety of pottery is that known as Samian, or more correctly, as Aretine ware. This is made of clay of a brilliant red color, and as molds and waste pieces have been found in England and France the presumption is that the clay as well as the workman was imported. No such clay is known to exist now and the wares are all made of the same material. The Roman "slip painted" or Castor ware was the ancestor, though after a long interval, of the English clay decorated pieces which gave the potter's art so firm a hold on the English people and eventually brought the knowledge of clay working to the American colonists.

In the far East a different line was being wrought out. The pottery of India and Persia was the descendant of Egyptian blue-glazed ware. The characteristic which distinguishes these wares from the productions of Greece and Rome is the glaze. Very early in the history of the art it was found necessary to use some impervious coating before the pottery could be extensively used, but in the East a covering of glaze was used for its decorative effect. This fact led to an important development. A glaze upon brown or red clay is not always pleasing, and therefore the expedient was adopted of coating the clay with a light-colored slip or engobe. Thus Oriental engobe ware has become a recognized type of ceramic production. Each Eastern nation in turn worked on similar lines. India affected colored glazes well known in the rich

blue roofing tiles of Multan. Persia adopted a delicate fanciful tracery of floral motif, the outlines being filled in with light blue and gray. A beautiful pottery, almost porcelain, was made in Persia and exported from the port of Gombroon, hence known as Gombroon ware. The characteristic feature was a series of fine perforations which were filled with glaze, producing a transparent pattern upon a slightly translucent ground.

Damascus produced many fine pieces of engobe ware, the treatment being more forceful than that of Persia. In the island of Rhodes and in certain neighboring localities variety was given by the adoption of red in the decoration. This red consisted of a natural earth. The development of the peculiar colors found on this ware is due to the absence of lead oxide from the glaze. (See GLAZE.) The Arabians and Moors carried the knowledge of pottery along the north coast of Africa, and when, in the 8th century, the former people invaded Spain they brought the art with them. It was not, however, until the Moorish invasion in the 12th century, and the building of the Alhambra palace, that any great progress was made. A notable change took place in the introduction of tin oxide as a glaze constituent. The knowledge of this substance existed farther east, but in Spain both tin and lead were found in abundance. The consequence was that the intermediate coating or engobe was discarded and the glaze itself rendered opaque by tin oxide. This of course involved a different treatment of color and as the art spread from Spain to Italy the great schools of Italian Majolica grew up. (See MAJOLICA.) In France some variations took place and in Germany the main product was stoneware (q.v.).

In England the ceramic art had never been forgotten. The departure of the Romans had caused a relapse and neither Anglo-Saxon nor Norman pottery was of any importance. About the Tudor period, however, a revival took place. The potters had foregathered in Staffordshire, where there was an abundance of clay, and there they produced the slip decorated, the combed, marbled, and tortoise-shell wares which are so characteristic of the time. A great stimulus was given by the arrival of two Dutchmen named Glers. These brothers were skilful potters and speedily influenced the quality of the claywares manufactured. They, in fact, prepared the way for Josiah Wedgwood, who established the English factory system and made it possible for skilled men to combine their efforts in the production of fine pottery. See WEDGWOOD.

In America the history of the ceramic art may be conveniently, if somewhat arbitrarily, divided into four epochs. (1) The work of the aborigines. (2) From Colonial times until 1840. (3) From 1840 to 1880. (4) The present day.

The work of the natives was varied and interesting. The wheel seems never to have been used; but, on the other hand, the process of building pottery by means of coils of clay was brought to great perfection. Barber (*'Pottery and Porcelain of United States'*) divides pre-Columbian pottery into three groups, (1) the crude work of the eastern coast; (2) the better wares of the mound builders, and (3) the superior productions of the more civilized tribes of the west.

CERAMICS

The eastern tribes were scarcely more than savages, even in the day of the Pilgrims. The pottery was rude in the extreme and scarcely burned. So fragile indeed that but few examples remain. The Wyoming Historical and Geological Society of Wilkesbarre, Wyoming County, Pa., have given attention to the preservation of these records, and they possess some unique specimens. Clay pipes were in common use among the Indians, and, in fact, were put in circulation as a kind of currency. Some of the Indian women even now in their reservations indulge in the pastime of pottery-making, but the manufacture has almost died out.

The pottery of the mound-builders forms an extensive study in itself. In addition to the building of plain forms considerable skill in modeling was developed. Not only were animal and bird forms produced, with more or less fidelity, but the human face, in some cases full of expression, was constantly used as a relief embellishment. Students distinguish between painted and unpainted wares, but there is divided opinion as to whether these classes were contemporaneous or divided.

Through the States of Colorado and Utah, and in the great valleys of the San Juan, the Colorado and the Rio Grande, are found numerous relics of the work of the house-building tribes. This pottery is far in advance of either of the other types. In some cases the structure of the soils is boldly asserted as a decoration, sometimes alone and often in conjunction with painting. Skill in modeling was well developed, but the work is archaic in type. Drawings of birds and beasts are frequently used in decoration and natural clays find frequent employment as colors. There is no doubt that the principles of decoration by which the contemporary basket work was embellished inspired much of the clay treatment.

Even the earliest settlers engaged more or less in clay work. Brick and tile were, naturally, their first products. See BRICK; ROOFING TILE.

The first pottery for white or cream wares was built at Burlington, N. J., about the year 1684. The abundant clays of New Jersey attracted the attention of many who had been concerned with pottery in the old country, and for nearly two hundred years the work was in close imitation of that manufactured in England. Nearly all the distinctive styles of the period were attempted. Slip painting, sgraffito, stoneware, and queensware were all pursued with more or less success, both English and German potters being at work. In some parts of the country, notably in eastern Ohio, pottery-making became a home industry. Many a barn held a "kick" wheel, and a small kiln served to finish the work. Farmers divided their time between clay and soil; and, building rough flat-boats, would float their wares down the river for sale in the large towns.

The third epoch may be described as that of the factory. The large pottery centres, East Liverpool, Ohio, and Trenton, N. J., were established about the beginning of the period. It may also be characterized as the era of bad quality. The potters were new to the local materials. Clays were carelessly mined and badly prepared, and in many cases the men who attempted to make pottery were ignorant of anything but the processes of manipulation. It

is not strange, therefore, to find that the work of this period was very inferior, nor to learn that those who made it were inordinately vain of their productions. Every now and then some enterprising manufacturer would attempt an important piece of work, but the results were uniformly disastrous. There is almost nothing to show for the work of these years but a series of misdirected efforts.

The cause of the renaissance which, happily for the country, at length dawned, was the Centennial Exhibition of 1876. There, for the first time, non-traveling Americans were brought face to face with the productions of Europe, and the contrast with American work was very marked. The effect of the lesson was not immediate. Some manufacturers declined to be aroused, they were making money under a high protective tariff and were content to produce inferior wares. Those upon whom the influence was strongest were private individuals, painters, sculptors, and amateurs. A company of women got together and eventually established the Rookwood Pottery. (See Rookwood.) On somewhat similar lines several small manufacturing of glazed pottery have since been opened, among which are the Grueby faience, Boston; the Merrimac pottery, Newburyport, Mass.; Lonsdale ware, Steubenville, Ohio; Lonelsa ware, Zanesville, Ohio. During this period a number of English decorators sought employment in this country. They were somewhat stereotyped in style and secured short engagements in factory after factory. A few pieces were produced at each, and for some reason the output ceased. A number of similar works are therefore extant. They have been made in many places of differently composed wares, but all are decorated by the same band of artists. The identification of such wares becomes very difficult therefore, but they remain as an evidence of a desire on the part of the manufacturers for a higher grade of work.

The pottery centres of East Liverpool, Ohio, and Trenton, N. J., have grown into large and prosperous communities. A number of English workmen have settled in each place, and the English accent and English sports flourish. In each city there are upward of 40 establishments directly engaged in producing ceramic wares and the accessories thereto.

The types of ware included in the term pottery range themselves according to color, structure, use, and locality. Thus Rockingham, yellow ware, and cream color, abbreviated to C. C., are definitions arising from color. Granite, ironstone, opaque china, and hotel china, are judged by structure, a fine vitreous body; the term "use" defines sanitary and railroad ware, mortars and chemical stoneware, while locality gives names to Belleek, Rookwood, and other fancy wares.

C. C. ware is the lineal descendant of English earthenware; the materials used are similar (see POTTERY), but a higher temperature is uniformly employed in America. The term is no longer accurate. The cream color was due to the natural tint of the clays of which even the best contain a small percentage of iron, but the exigencies of trade have forced the potters to neutralize this by the addition of a blue stain. C. C. therefore can no longer be distinguished by its color.

CERAMIC SOCIETY — CERATOSA

Rockingham and yellow wares are virtually the same wherever made. Common buff-burning clays are used, and in the former ware the glaze is stained dark-brown by the use of manganese; in the latter a cheap lead glaze over the yellowish clay intensifies the color. Jet ware is usually made from a red clay covered with a blue glaze.

In the production of sanitary ware America holds the field. Great demands have been made upon the potters on account of increased domestic comforts and the elaboration of railroad fittings. The earthenware necessities of kitchen and bathroom have been brought to great perfection, both in composition of body and glaze and in methods of manufacture. See ENAMELED POTTERY.

No factory of any repute is without a complete plumber's apparatus by which every piece is tested for its action with water before being shipped.

Hotel china has also been brought to a highly satisfactory point. The demand of hotels and restaurants for a tough ware led a number of manufacturers into the experimental field. Costly as was the process, one after another has come forth successful. The conclusion to which all have arrived is that high temperature is the secret of success. The mixture of materials must of course be adjusted to suit the extreme heat, and there is no doubt that tons of pottery have been destroyed before the correct proportions were found. This ware is a distinctive American product. It can be matched against any pottery in the world of its own class without risk of failure. It has little or no pretence to artistic merit, for the decorations are, for the most part, inexpensive, but for withstanding the knocks of a strenuous life there is nothing so good. The principal factories making this ware are the Greenwood Pottery, the Lamber-ton Works, and the Crescent Pottery, of Trenton; the Knowles, Taylor & Knowles Company, of East Liverpool, Ohio; and the Onondaga Pottery, of Syracuse, N. Y.

Belleek ware had its origin in the town of that name in Fermanagh, Ireland, and the first ware made in America of this type was compounded by men who had worked in the old country, and was avowedly an imitation of the Irish product. It, however, speedily assumed a character of its own and was pursued on entirely different lines. The ware belongs to the class of soft porcelain. It is light, translucent and of a pale creamy color. The body is largely composed of feldspar, which is mined in Maine and Connecticut in great abundance. The glaze is a fusible compound in which lead oxide is largely present. This porcelain is greatly in demand for over-glaze painting. The soft glaze enables almost any ceramic color to be melted to a brilliant surface in any of the ordinary studio kilns. The best Belleek is made by the Ceramic Art Company and the Willetts Manufacturing Company, of Trenton, N. J.

An account of American ceramics would not be complete without a word on the enthusiasm for china-painting and clay-working which has possessed American women for the last two decades. The movement took serious shape soon after the Centennial Exposition, and may be said to have reached its height in 1893. In that year at the World's Fair a great quantity of so-called "amateur painting" was exhibited, and some of it was severely criticised. The

criticism was taken to heart and from that time the work greatly improved. Study-clubs were formed and more serious work undertaken, culminating, in a number of instances, in women undertaking to produce their wares from the clay, instead of being content to paint upon purchased pieces. This movement is yet in its infancy and must eventually exercise a large influence upon the quality of American clay-work.

CHARLES F. BINNS,

New York State School of Ceramics.

Ceramic (se- or ke-rām'ik) **Society, The American**, a body of scientific clay-workers organized in 1899. The 'Transactions' of the Society already form the most complete record of progress in ceramic knowledge published in the English language.

Cerargyrite, native chloride of silver, AgCl. It crystallizes in the isometric system, and is cubical in general habit. It has a specific gravity of 5.55, and is quite soft, with a grayish color and a resinous lustre. Upon exposure to light its color changes to a violet-brown. It occurs in Mexico, in western South America, in Norway, and in the Ural Mountains. In the United States it is found in Idaho, Utah, Colorado, Nevada, and Arizona. When found in quantity it is valuable as an ore of silver.

Cerastes, a genus of African vipers, remarkable for their fatal venom, and for two little horns formed by the scales above the eyes. Hence they have received the name of horned vipers. The tail is very distinct from the body. *C. cornutus* is the horned viper of northern Africa, a species known to the ancients. There are several other species.

Cerasus, a genus of trees, the cherries, of the order *Rosacea*, now always regarded as a section of the genus *Prunus*, distinguished from the other sections by the smooth, bloomless fruit, conduplicate vernation, and other characters. See CHERRY.

Cerates, official preparations of the United States Pharmacopœia. They are unctuous substances, consisting of oil or lard mixed with wax, spermaceti, or resin, to which various medicines may be added. In consistency they are harder than ointments and softer than plasters, and should be capable of being spread at ordinary temperatures on cloth, and should not melt at the temperature of the human body.

Ceratodus, sēr'a-tō-dūs, a genus of fishes belonging to the *Dipnoi* or lung-fishes. It is the barramunda or native salmon of the Australian rivers, measures from three to six feet in length, and forms an interesting connecting link between the oldest surviving group of fishes and the lowest air-breathing animals. It is said to leave the water and go on the flats after vegetable food, but its traveling powers cannot be great.

Cerato'sa, certain sponges in which the skeleton or solid support is horny. Another name is *Ceratospongia*. The skeleton consists of spongin, which differs chemically from the substance of true horn (keratin). The spongin is deposited in long fibres by peculiar cells (spongioblasts). The fibres interlace, branch, and unite into the supporting framework of the sponge. Examples of the horny or fibrous sponges are the bath-sponges, such as *Euspongia officinalis*, varieties of which occur in the Medi-

CERATOSAURUS — CEREALS

terranean and about the West Indies, Florida, etc. See SPONGE.

Ceratosauros, sĕ-ra-tō-sōr'ūs, a carnivorous dinosaur (see DINOSAURIA) resembling *Allosaurus* (q.v.), but of smaller size and with small horns over the eyes and on the nasal bones. It is found in the Como formation of Wyoming (Upper Jurassic Period).

Ceraunian (sĕ-rā-nī-ān) **Mountains**, in classical geography, (1) a mountain range in the southeastern part of the Caucasus Mountains, the exact position of which is not known; (2) a chain of mountains in Epirus, northern Greece, extending to the Adriatic and forming the peninsula Acroceraunium (q.v.). The mountains themselves are also called Acroceraunia.

Cerberus, sĕr'bĕ-rūs, in Greek myths, a three-headed dog, with snakes for hair. Hesiod describes him as fifty-headed, and states him to have been the offspring of Echidna by Typhon, the most terrible of the giants that attempted to storm heaven; but later writers give him only three heads. At his bark hell trembled, and when loosed from his hundred chains, even the Furies could not tame him. He watched the entrance of Tartarus, or the regions of the dead, and fawned on those who entered, but seized and devoured those who attempted to return. He was subdued by Heracles (Hercules).

Cercaria, sĕr-kā-rī-ā, the so-called "nurse" of the fluke-worm (q.v.) and other trematode parasites. The body is tadpole-like in shape, with an anterior and posterior sucker, a mouth and pharynx, and a forked intestine. The *Cercaria* are developed in the body of the parent-nurse (*redia*). Escaping from the *redia*, the cercaria, swimming about in pools or ponds, forces its way into the body of some snail, which forms its first host. Then, losing the tail, it becomes encysted, attached to blades of grass or herbage. The transference of the larval fluke to its final host, the sheep, is effected if the latter swallow the grass on which the cercaria has become encysted. The young fluke then escapes from the cyst, and forces its way up the bile-ducts to the liver, in which it rapidly grows, and developing reproductive organs, attains the adult condition. See TREMATODA.

Cercelée, sĕr-sĕ-lā, or **Recercelée**, in heraldry, applied to a cross, the ends of which are curled or twisted, like a ram's horn.

Cercis, sĕr'sis, a genus of plants of the order *Leguminosae*. *C. canadensis*, redbud, or Judas-tree, is a small ornamental tree, often cultivated, but growing wild from New York south to Florida and west to Minnesota, Kansas, and Louisiana. *C. siliquastrum*, a native of the south of Europe, and of several countries in Asia, is a handsome, low tree with a spreading head. The leaves are remarkable for their unusual shape; they are of a pale, bluish-green color on the upper side, and sea-green on the under. The flowers, which have an agreeable acid taste, are often mixed in salads, and the flower-buds are pickled. The genus received the name of the Judas-tree from the tradition that it was upon a specimen of it, near Jerusalem, that Judas hanged himself.

Cercopithecidae, sĕr-kō-pī-thĕ'sī-dĕ, a family of primates, including all the Old World monkeys, except the anthropoid apes. The various groups and species may be found described under their names. See also MONKEY.

Cer'cyon, a famous robber, killed by Theseus.

Cerdic, kĕr'dīk, king of the West Saxons: d. 534. He was a Saxon earldorman who invaded England in 495, and after gradually fighting his way and extending his conquests, established the kingdom of Wessex about 519. He won a great battle at Charford in 519, but suffered a severe defeat from the Britons in 520 at Mount Badon, or Badbury, in Dorsetshire. In 530 he conquered the Isle of Wight. At his death his kingdom extended over the present counties of Berkshire, Wiltshire, Dorsetshire, and Hampshire (including the Isle of Wight).

Cerdo'nians, an ancient sect, whose belief, half philosophical, half religious, was a confused mixture of Christian dogmas with Oriental dualism and Gnostic ideas. Their founder, Cerdo, was a Syrian, who came to Rome about the year 139 under the pontificate of Hyginus. He maintained the existence of the Zoroastrian two principles, one of good and the other of evil. The latter, according to him, was the creator of the world and the God and lawgiver of the Jews. The former was the creator of Jesus Christ, whose incarnation, sufferings, and death were only sensible appearances, and not vital facts. His disciples became confounded with those of Marcion, who some years later propagated similar opinions.

Céré, Jean Nicolas, zhŏn nīk-ō-lā sā-rā, French botanist: b. Isle of France 1737; d. there 2 May 1810. Under the direction of the French government he greatly extended the culture of spices in the Isle of France (now Mauritius), when that island was a French dependency. The agricultural society of Paris published his essay on the culture of rice, and awarded him a medal; and Napoleon confirmed him in his position as director of the botanical garden of the Isle of France, and conferred on him a pension of \$120. A tree of the island has been called after him, *Cerea*.

Cere, sĕr, the naked skin or fleshy sheath that covers the base of the upper mandible in some birds, through which it is supposed that a tactile sense is exercised.

Cerealia, sĕ-rĕ-ā'lī-a (from Ceres, the goddess of the fields and of fruits) signified the productions of agriculture, also the festivals of Ceres, celebrated at Rome. The time at which they were celebrated is not known. According to some it was the ides (13th) of April; according to others the 7th of the same month.

Ce'reals, a term derived from Ceres, the goddess of corn. Though sometimes extended to leguminous plants, as beans, lentils, etc., it is more usually and properly confined to the *Gramineae*, as wheat, barley, rye, and oats, which are used as human food. In agriculture they are usually considered as exhausting crops, partly on account of their trailing roots; their mode of nutrition, which is effected more by the roots than by the leaves; their slender stems, which allow weeds to grow up and rob the soil; and from the necessity of allowing them to attain full maturity before they are reaped.

CEREALS—CEREMONIAL OF THE EUROPEAN POWERS

Accordingly it is considered one of the rules of good husbandry not to take two cereal or white crops in succession, but to make them alternate with root crops, which, growing in rows at some distance apart from each other, have the additional advantage of allowing weeds to be destroyed by means of repeated hoeings.

Cereals, or Cereal Plants, the grasses cultivated for their seeds which are used as food by man and animals. Sometimes also called bread-plants and, in Europe, corn-plants. The principal ones are treated in separate articles. See **BARLEY**; **MAIZE**; **MILLET**; **OATS**; **RICE**; **RYE**; **SORGHUM**; **WHEAT**.

Cerebellum, sĕr'e-bĕl'ŭm ("the little brain") that portion of the brain situated behind and beneath the cerebrum. It is connected with the main brain mass by means of two feet or stems, the cerebellar peduncles, and is separated from the main brain mass in the cranial cavity by a thick layer of connective tissue, the tentorium cerebelli. It is also connected with the pons by a pair of middle peduncles, and with the medulla oblongata by the inferior peduncles. It thus forms a very integral portion of the brain mass. In general the form of the cerebellum in human beings is a flattened ovoid measuring from eight to ten centimeters from side to side, five to six centimeters from before backward, and five centimeters vertically. Its average weight is about 140 grams, which is one eighth of the weight of the whole cerebro-spinal axis. It is larger and heavier in the male than in the female, and is relatively larger in the adult than in the child. Like the brain, it is divided up into a number of lobes, of which three are most prominent, the middle portion, or vermis, and the two lateral lobes. The minute structure of the cerebellum is somewhat similar to that of the cerebrum, but there are certainly very marked differences, particularly in the development of a layer of very characteristic cells, the Purkinje cells. The interior of the cerebellum contains masses of gray matter, or nuclei. These are the dentate nucleus, the nucleus emboliformis, nucleus globosus, and the nucleus fastigii in the vermis. Through the inferior, middle, and superior peduncles fibres pass to and from the cerebrum, pons, medulla, and spinal cord, thus bringing the cerebellum into organic union with the rest of the nervous system. The functions of the cerebellum are not yet completely known, but it is certain that the cerebellum has a number of important functions, chief among which are those connected with locomotion and the act of balancing. Affections of the cerebellum often result in a peculiar form of staggering, known as cerebellar ataxia. See **BRAIN**.

Cer'eb'ral Hemorrhage. See **BRAIN**, **DISEASES OF**.

Cerebra'tion, an old term, much used in the early physiologies, designating an automatic reflex series of brain actions taking place below the threshold of consciousness. See **CONSCIOUSNESS**.

Cerebrin, sĕr'e-brĭn, a name that has been applied, at different times and by different chemists, to various substances that are obtainable from the brain and other parts of the nervous system by extraction with alcohol. It is now usually applied to a white, crystalline,

nitrogenous powder that is obtained by heating ox-brain with baryta, washing, drying, and finally extracting with alcohol. The cholesterin that is also present in the product so obtained may be removed by the action of ether, in which cerebrin is insoluble. Cerebrin does not combine with acids or bases, but by prolonged boiling with hydrochloric acid it is converted into a substance that can reduce Fehling's solution.

Cer'ebro-spi'nal, pertaining to the brain and spinal cord together, looked on as forming one nerve mass.

Cerebro-spinal Fluid. See **BRAIN**.

Cerebro-spinal Meningitis. See **MENINGITIS**.

Cerebrum. See **BRAIN**.

Ceremo'nial of the European Powers, certain forms of international etiquette or usage, which have arisen in Europe during modern times. No independent state can actually have precedence of another; but as the weaker seek the protection and friendship of the more powerful, there arises a priority of rank. This has occasioned the gradual establishment of dignities, rank, and acts of respect to states, their rulers, and representatives, by which means (in contradistinction to the internal etiquette of a state) an international ceremonial has been formed, which has been the source of confusion and war, and to the observance of which far more consideration is often paid than to the fulfilment of the most sacred contracts. Louis XIV. carried this folly further, perhaps, than any one before or after him. To this international ceremonial belong:

1. Titles of rulers. Accident made the imperial and regal titles the highest, and thus conferred advantages apart from the power of the princes. After Charlemagne, the emperors of the Romans were considered as the sovereigns of Christendom, maintained the highest rank, and even asserted the dependence of the kings on themselves. For this reason several kings in the Middle Ages, to demonstrate their independence, likewise gave their crowns the title of "imperial." England, for example, in all its public acts, is still styled the "imperial crown." The kings of France received from the Turks and Africans a title equivalent to emperor of France. In progress of time the kings were less willing to concede to the imperial title, of itself, superiority to the royal.

2. Acknowledgment of the titles and rank of rulers. Formerly the Popes and emperors arrogated the right of granting these dignities; but the principle was afterward established, that every people could grant to its rulers at pleasure a title, the recognition of which rests on the pleasure of other powers, and on treaties. Some titles were therefore never recognized, or not till after the lapse of considerable time. This was the case with the royal title of Prussia, the imperial title of Russia, the new titles of German princes, etc.

3. Marks of respect conformable to the rank and titles of sovereigns. To the "royal" prerogatives, so called (conceded, however, to various states which were neither kingdoms nor empires, such as Venice, the Netherlands, Switzerland, and the electorates), pertained the right of sending ambassadors of the first class, etc. In connection with this there is a much contested

point, namely, that of precedence or priority of rank, that is of the right of assuming the more honorable station on any occasion, either personally, at meetings of the princes themselves, or of their ambassadors, at formal assemblies, etc., or by writing, as in the form and signature of state papers. There is never a want of grounds for supporting a claim to precedence.

As the councils in the Middle Ages afforded the most frequent occasion of such controversies, the Popes often intervened. Of the several arrangements of the rank of the European powers which emanated from the Popes, the principal is the one promulgated in 1504 by Julius II., through his master of ceremonies, in which the European nations followed in this order: (1) the emperor of the Romans (emperor of Germany); (2) the king of Rome; (3) the king of France; (4) the king of Spain; (5) of Aragon; (6) of Portugal; (7) of England; (8) of Sicily; (9) of Scotland; (10) of Hungary; (11) of Navarre; (12) of Cyprus; (13) of Bohemia; (14) of Poland; (15) of Denmark; (16) Republic of Venice; (17) Duke of Bretagne; (18) Duke of Burgundy; (19) Elector of Bavaria; (20) of Saxony; (21) of Brandenburg; (22) Archduke of Austria; (23) Duke of Savoy; (24) Grand-Duke of Florence; (25) Duke of Milan; (26) Duke of Bavaria; (27) of Lorraine. This order of rank was not, indeed, universally received, but it contained a fruitful germ of future quarrels; some states, which were benefited by the arrangement, insisting upon its adoption, and others, from opposite reasons, refusing to acknowledge it. To support their claims for precedence the candidates sometimes relied on the length of time which had elapsed since their families became independent, or since the introduction of Christianity into their dominions; sometimes on the form of government, the number of crowns, the titles, achievements, extent of possessions, etc., pertaining to each. But no definite rules have been established by which states are designated as being of the first, second, third, fourth, etc., rank. Rulers of equal dignity, when they make visits, concede to each other the precedence at home; in other cases, where the precedence is not settled, they or their ambassadors take turns till a compromise is effected in some way. In Great Britain and France far less ceremonial is observed, in the official style, than in Germany, where forms and titles are carried to an absurd extent, and the ceremonial words, which extend even to the pronouns by which the princes are designated, it is not possible to translate. Emperors and kings mutually style each other "brother," while they call princes of less degree "cousin." The German emperors formerly used the term "thou" in addressing other princes. The "we," by which monarchs style themselves, is used either from an assumption of state or from a feeling of modesty, on the supposition that "I" would sound despotical, while "we" seems to include the whole administration, etc.

Cereopsis, sē-re-ōp'sis, the pigeon-goose, an Australian genus of the *Anatida* or duck family, and the subfamily *Anserina*, or geese. *C. novæ hollandiæ* is abundant on the south coast of Australia and the adjacent islands.

Ceres, sēr'ēz, the name given by the Romans to the Greek goddess of agriculture,

Demeter, when her worship was introduced into Rome. The origin of the name cannot be explained with certainty. It is not Latin; but some think that it was Etruscan, among whom, according to Servius, Ceres was one of the Penates. Others think that Ceres may be the same with the Greek Cora, or Core (that is, "maiden"), another name for Persephone, the daughter of Demeter, with whom Demeter herself was often confounded. The worship of Demeter, or Ceres, was introduced into Rome from Sicily at the beginning of the 5th century B.C., and the first temple to her was vowed by the dictator, A. Postumius Albinus, 496 B.C. Her worship soon acquired a considerable degree of political importance. As usual when the Romans introduced the worship of a foreign divinity into their own city, they adopted all the legends connected with that divinity, adapting them to their own mythology. Thus, since Demeter was said by the Greeks to be the daughter of Kronos and Rhea, and accordingly sister of Hera, Aides (or Hades), Poseidon, Zeus, and Hestia, so Ceres was regarded by the Romans as the daughter of Saturn and Ops, and sister of Juno, Pluto, Neptune, Jupiter, and Vesta; and so also the Persephone of the Greeks became the Proserpine of the Romans. See DEMETER.

Ceres, the name of the first asteroid discovered. It was discovered by Piazzi 1 Jan. 1801. Having observed it at Palermo, in Sicily, he called it Ceres, after the old tutelary divinity of that island. Under favorable circumstances it has been seen by the naked eye as a star of the seventh magnitude, but more generally it looks like one of the eighth magnitude, only the light has a red tinge, and a haze surrounds the planet as if it had a dense atmosphere.

Cereus, sēr'ē-us, a genus of plants of the order *Cactacea*, remarkable for their singularity of form and the beauty of the flowers. *C. giganteus*, the Suwarrow or Saguaro of the Mexicans, is the largest and most striking of the genus. It rises to the height of 50 or 60 feet, and looks more like a candelabrum than a tree of the normal type. Other notable species are *C. senilis*, the long gray bristles of which give it the appearance of the head of an old gray-haired man. *C. grandiflorus* is the night-flowering cereus, but there are others which also flower at night. *C. speciosissimus*, an erect plant, commonly cultivated in greenhouses, is a native of Mexico. *C. flagelliformis*, a creeper, is not unfrequently met with in gardens. The members of the genus are generally useful as cardiac agents and antipyretics,—particularly the Mexican fever-few, *C. Bonplandi*.

Cerignola, chā-rēn-yō'là, Italy, a town in the province of Foggia, and 24 miles southeast from the city of Foggia. It has a college, several convents, and a hospital. The inhabitants manufacture linen; and the district produces large quantities of almonds and cotton. In 1503 the Spaniards, under Gonzales, Duke of Cordova, here defeated the French, when the Duke de Nemours, who commanded the latter, was slain. Pop. 34,000.

Cerigo, chā'rē gō (ancient CYTHERA), an island in the Mediterranean, separated from the southern coast of the Morea by a narrow strait. It formerly belonged to the Ionian Republic of the Seven Islands, but since 1864 has been part

CERINTHUS — CERNUSCHI

of the kingdom of Greece; area about 106 square miles. Cerigo, with the neighboring islands, now forms one of the eparchies belonging to the province or nome of Argolis and Corinthia. It is rather rocky and mountainous. Grain, wine, olives, and other fruits are raised. Sheep and goats constitute the chief live stock. The people are of Greek origin, and are all of the Greek Church. At an early period a Phœnician colony was founded here. Later it was successively under the control of Argos, Sparta, and Athens, and finally fell into the hands of the Romans. After submitting to Venice and then to Turkey, in 1718, it was once more assigned to Venice. It was annexed to France in 1807; two years later it was occupied by the English; and since 1815 it has shared the fate of the Ionian Islands. It was anciently sacred to Aphrodite (Venus), who was also called Cytherœa. Pop. 12,306.

Cerinthus, one of the first heresiarchs who, according to St. Irenæus in his work, 'Against Heresies,' was contemporary with the evangelist St. John; but Tertullian and Epiphanius refer him to the time of Hadrian. In Irenæus' work, as also in the 'Philosophumena,' attributed variously to Origen and Hippolytus, bishop of Ostia, Cerinthus is represented as an alumnus of the pagan philosophical schools of Alexandria; but he broached his heretical doctrines in Asia Minor, and there had a numerous following. The universe, he taught, is not the work of the First God, but was created by some angelic power far inferior to the supreme power. Jesus he held to be the son of Joseph and Mary, born as other men are born, but excelling all in righteousness, wisdom, and understanding. Cerinthus taught also that upon Jesus, after his baptism by John, descended the Christos from the power which is supreme over all, in the form of a dove, and that when Jesus proclaimed the unknown Father and wrought miracles; but that at the end of the passion the Christos flew away out of Jesus, and Jesus suffered, but that the Christos remained impassible, being the spirit (or breath) of God. Angels play a conspicuous part in the system of Cerinthus. Thus it was an angel, he says, that gave the law to Moses; and the Jahve of Israel was an angel. Cerinthus and his followers entertained a special animosity against St. Paul and St. John, and the heresiarch is credited with writing an apocalyptic book in rivalry with St. John. He is said to have been a believer in the millennial reign of the Christ upon the earth.

Cerite, sê'rit, a mineral occurring only at Riddarhyttan, in Sweden, and containing the rare element cerium, and others of the cerium group. Its formula is not certainly known, but the mineral may be described as a silicate of the metals of the cerium group, combined with small quantities of calcium and iron. It is mostly massive or granular, but crystals belonging to the orthorhombic system are sometimes found. Cerite has a hardness of about 5.5, and a specific gravity of about 4.9. It has a peculiar and characteristic color, intermediate between clove-brown and cherry-red, shading off to a gray.

Cerito, **Francesca**, frân-chês'kâ chà-rê'tô, commonly called FANNY, Italian danseuse: b. Naples 1823. She was the daughter of an officer who served in the Neapolitan army under Murat,

and made her début at the San Carlo theatre in 1836, and, although only 13, was received with great enthusiasm. At Milan, in 1838, and for two years at the Kärnthertheatre in Vienna, and afterward in Paris and London, everywhere the same storm of applause greeted her appearance, especially in London. She excelled most in lively, gentle, arch, and delicate gestures and attitudes, and less in heroic or classical parts. In 1850 she separated from her husband, Mr. St. Leon, who was well known in Paris and London as dancer and violinist.

Ce'rium, sê'rî-ûm, a metallic element the oxide of which was discovered and recognized as a new substance in 1803 by Klaproth, and, independently, by Berzelius and Hisinger. It was named for the minor planet Ceres, which was also discovered at about the same time. The principal source of cerium is the mineral monazite (q.v.), which is a silicate of cerium and certain other allied elements. Cerium forms a basic nitrate that is insoluble in water, and this fact affords a ready means of separating the metal from the other elements with which it is almost invariably associated. Metallic cerium may be obtained by electrolysis of the anhydrous chloride, or by melting the anhydrous chloride with metallic sodium. Thus prepared, cerium is a steel-gray metal, ductile and malleable, and melting at a temperature probably not far from the melting-point of silver. Its chemical symbol is Ce, and its atomic weight is 140 if O=16, and 139 if H=1. It has a specific gravity of from 6.6 to 6.75, and a specific heat of about 0.0448. It does not change in dry air, but in moist air it oxidizes superficially. It decomposes cold water slowly, and hot water quickly. Two oxides of the metal certainly exist, one having the formula Ce₂O₃, and the other the formula CeO₂. Three other oxides have also been described, with the formulae CeO₃, Ce₂O₄, and Ce₃O₄; of these the first probably exists, but the other two still need confirmation. Oxide of cerium is also used in the manufacture of the better grades of incandescent gas-mantles. A fabric of cotton is woven of the desired form, and this is impregnated by repeated dipping in a solution of the nitrates of cerium and thorium. On ignition the cotton burns away, and the nitrates are converted into oxides, which give the intense luminosity desired. A mixture of 99 per cent of thorium oxide to 1 of cerium oxide gives the best results.

In medicine the insoluble salts of cerium are used, cerium oxalate alone being official. It resembles the insoluble bismuth compounds in its action, being a sedative to mucous membranes, and it is much used as an antemetic, particularly in the nausea of pregnancy. The soluble salts of cerium are poisons, their action being similar to the soluble salts of bismuth.

Cernuschi, **Enrico**, ên-rê'kô chër-noos'kê, Italian economist: b. Milan, Italy, 1821; d. Mentone 12 May 1896. He was graduated at Pavia in 1842, fought for liberty in the insurrection of 1848, and was obliged to flee from Italy, owing to political proscription. He acquired a large fortune in Paris as a banker, but owing to the hostility of the communists left France in 1871 and traveled extensively in Egypt, China, Japan, England, and the United States, visiting the last-named in 1877. He was an ardent bimetallic, and published 'Mecanique de

CERO — CERRO DE PASCO

l'Échange' (1865); 'Illusions des Sociétés co-operatives' (1886); 'Discours' (1871); 'Silver Vindicated' (1876); 'Le Bi-métallisme à quinze et demi' (1881); 'Anatomie de la Monnaie' (1886); etc.

Cero, sērō, a large, edible fish (*Scomberomorus regale*) of the western Atlantic, and similar to the Spanish mackerel. Another species (*S. caballa*), also called "sierra" or "king-cero" is found in the southern Atlantic, and reaches double the weight of the former, often attaining 100 pounds.

Ceroxylon, a genus of South American palms. See WAX-PALM.

Cerquozzi, Michelangelo, mē'kūl ān'jā-lō chār-kwōt'zē, Roman painter: b. Rome 1602; d. 1660. He received the surname *delle battaglie* (battle-painter), and at a later period that of *delle bambocciate*, because, in imitation of Peter Laar, he painted ludicrous scenes taken from low life, such as that to be seen at fairs and markets, and among the Lazzaroni. In his later years he painted flowers and fruit.

Cerretti, Luigi, loo-ē'jē chēr-rēt'tē, Italian poet and rhetorician; b. Modena 1 Nov. 1738; d. Pavia 5 March 1808. The purity and elegance of his diction made him, at an early age, the most distinguished professor of rhetoric and oratory in Italy. His 'Poems and Select Prose,' collected into a posthumous volume, were instantly successful, and have retained their rank ever since.

Cerro Blanco, the highest mountain in New Mexico; summit, 14,269 feet.

Cerro Gordo, thēr rō gōr'dō, or sēr'rō gōr'dō ("Big Hill"), a famous mountain pass in Mexico, the scene on 18 April 1847, of one of the sharpest battles of the Mexican war. After the capture of Vera Cruz on the coast, Gen. Scott moved northwest toward the City of Mexico, along the National Road. Some 50 miles from Vera Cruz this leaves the steaming lowlands and climbs a steep rocky plateau, an eastern spur of the great mountain range, seamed with ravines and thick with chaparral, and pierced by the defile of the little Rio del Plan. To this defile the road after crossing it and leaving it by a loop to the north among the mountains, returns at a ravine separating a sharp rocky ridge called Atalaya from a conical eminence termed Telegraph Hill. West of this again is the small hamlet called Cerro Gordo, which gives its name to the pass. On 9 April Santa Anna began fortifying Telegraph Hill, and from the 12th pushed on the work with all his force; accumulating about 12,000 men, the bulk at Cerro Gordo, but neglecting to occupy Atalaya. On the 11th, Scott's vanguard under Twiggs and Harney came up to Rio del Plan at the foot of the plateau, where the road crosses the river, drove away a few Mexican lancers, established a camp, and began reconnaissances. Santa Anna, in place of attacking the scattered detachments, confided in his strong position, and the lowland fevers which must force the Americans to fight him, and waited. By the 17th most of Scott's forces had come up; and he pushed Twiggs forward within easy striking distance. The latter, finding Atalaya undefended occupied it just as a Mexican detachment advanced to do so, routed them, and chased them in headlong flight half

way up Telegraph Hill. The whole American army, about 8,500, being now at hand, Scott issued orders for a general advance next day. Santa Anna's line extended from Telegraph Hill to a road at the ravine, and eastward for a mile along the heights overlooking the National Road, which end in a precipitous rocky bluff 100 feet high; then back over three ridges terminating in rocky knolls, to the river defile. In front of the batteries and infantry, the chaparral had been cut down and piled into an abatis for several hundred feet. The Americans, on the other hand, planted powerful batteries on Atalaya, and enfiladed the Mexican right with a howitzer across the river. Scott's plan was simple, but brilliantly effective, though the impassable ground made it fall short of the full intention. Since the Mexicans expected the chief attack on their right, he resolved to make only a feint there and assuming that they expected him to move forward along the road resolved not to do so. In the meantime he ordered the roads cleared around the hills to the north in order that by making a circuit to the National Road in the rear of the Mexicans he might cut off their retreat. On the morning of the 18th Pillow assailed the right; the artillery on Atalaya rained shot and shell with terrific effect on Telegraph Hill, the road batteries, Santa Anna's camp, and even his reserves, and the howitzer over the river added its discharge. Twiggs, Shields, and Worth, with Riley, then moved along the circuit till on the north flank of Telegraph Hill, at first out of sight, then in full range of the Mexican fire. Santa Anna detached part of the forces on Telegraph Hill to drive them back; then Harney from Atalaya swept over the crest and down the side, up Telegraph Hill till within 200 feet of the batteries and below their range. There he reformed and in one final charge utterly routed the Mexicans, at the same time turning the forces on the hill against the main body of Mexicans at Cerro Gordo. The entire right, its retreat cut off, threw down its arms and surrendered. The main body broke up in a panic as the fugitives from Telegraph Hill rushed among them and the guns from that quarter cut them down and fled wildly down the craggy slopes and to the defile, and westward along the road. The Mexicans lost 1,000 or 1,200 in killed and wounded; about 3,000 prisoners, including five generals, and 299 other officers; 43 guns, and 3,500 small arms. The Americans lost 63 killed and 368 wounded. The victory laid open the road nearly to the Mexican capital.

Cerro de Pasco, sēr'rō dā pās'kō, Peru, capital city of the department of Junin, at the northern extremity of the plateau of Bourbon, 14,275 feet above the level of the sea. The town came into existence in 1630, in consequence of the discovery of veins of silver there by an Indian. The streets are narrow and crooked, and the houses small and without windows or balconies. The inhabitants are a mixture of all races and nations, who make their living by the produce of the mines. From October to July hail-storms, mists, and snow-falls make the place almost intolerable, and in summer with the exception of a few clear days the climate is little better. On account of the extreme rarity of the air the difference in temperature

CERRO GORDO DE POTOSI — CERVANTES SAAVEDRA

in the sun and in the shade is great. Cerro de Pasco still contains the most productive mines in all Peru, although they no longer yield the almost fabulous wealth that the Spaniards are said to have derived from them. Many of the shafts leading down to the veins of silver are in the town itself, and have their openings either in little huts or in the dwellings of the owners of the mines. According to the greater or smaller depth of the diggings they are called *minas* or *cortcs*. The silver is found partly pure, and partly in ores containing from 25 to 80 per cent of the precious metal. Pop. (very variable) about 7,000.

Cerro Gordo de Potosi, da pō-tō-sē', a mountain in the Andes of Bolivia; southwest of Potosi, 16,150 feet high. It is remarkable for its deposits of silver.

Cerro Largo, sēr'rō lār'gō, a department in the northeast of Uruguay, well watered, with large savannahs and forests. Area, 5,729 square miles. Capital, Cerro Largo or Melo. The inhabitants are chiefly engaged in cattle-raising. Pop. 36,000.

Cerros, or **Cedros Island**, an island belonging to Mexico, in the Pacific Ocean, off the west coast of Lower California. It is for the most part mountainous and barren, but is thought to possess mineral wealth. Area, 12 square miles.

Certaldo, Italy, a town of Tuscany, partly on a conical height, and partly on a flat along the right bank of the Elsa, 15 miles southwest from Florence. It is the birthplace, was long the home, and now contains the ashes of Boccaccio. His house is still shown, and in one of its rooms are collected numerous relics of the author of the 'Decameron,' and a large fresco painting of him by Benvenuti of Florence.

Certiorari, sēr-tē-ō-rā-rī, or sēr-shē-ō-rār'ī, in law, a writ, the purport of which is to remove convictions, orders, or proceedings before magistrates, indictments, and records in civil actions before judgment, from inferior courts into the courts above, with a view that the party may have justice done to him, or that the superior court may see whether the justices or court below, before which the proceedings have taken place previously to the certiorari being obtained, have kept within the limits of their jurisdiction. This writ, from the moment of its delivery to the judges of the court below, or magistrate, suspends their power, and any subsequent proceedings by them are void and *coram non judice*. Although the writ of certiorari removes the record from the inferior court into the court above, yet the court above does not take up the cause where the proceedings stopped, but begins *de novo*. Procedure by appeal has largely superseded that by certiorari.

Ceruleum, a blue pigment, consisting of stannate of protoxide of cobalt mixed with stannic acid and sulphate of lime.

Ceruminous Glands, the glands of the ear which secrete the cerumen or wax which lubricates the passage to the tympanum and prevents the entrance of foreign matter.

Cerussite, the native lead carbonate, PbCO₃. It is common in orthorhombic crystals, very frequently stellately twinned. It also

abounds in massive, earthy and stalactitic forms. It is very brittle, has a hardness of 3. to 3.5 and the high specific gravity of 6.5. It is usually translucent and of an adamantine or pearly lustre. Its color is white or gray, though green and yellow tints are not uncommon. It is one of the most abundant and valuable ores of lead, and often carries silver. It is formed from galena by the action of solutions of calcium bicarbonate. Among its many important localities are Broken Hill in New South Wales, Ems in Germany, and Phoenixville, Pa.

Cerutti, Giuseppe Antonio Gioachimo, joo-sēp'pē an-tō-nē-ō jō-ā-kē'mō chā-roo'tē, Italian Jesuit theologian: b. Turin 13 June 1738; d. Paris, February 1792. He was one of the most eminent professors in the Jesuit College at Lyons and his 'Apology for the Jesuits' attracted much attention. He had already published two discourses upon the means of preventing duels, and on the reasons why modern republics have not reached the splendor of the ancient. The last received the prize of the Academy of Dijon. He was at Paris when the Revolution broke out in 1789. Abandoning his former principles he became one of the most zealous supporters of the new order of things. He was intimately connected with Mirabeau, and labored much for him. He also published several pamphlets, among which was a 'Memoire sur la Nécessité des Contributions Patriotiques.' In 1791 he was a member of the legislative assembly. Some time after he delivered, in the Church of St. Eustache, a funeral discourse upon Mirabeau. The city of Paris called a street after his name.

Cervantes Saavedra, Miguel de, mē-gēl' dā thār-ban'tēs sa-a-bā drā, Spanish poet and novelist, one of the great writers of modern times: b. Alcalá de Henares 9 Oct. 1547; d. Madrid 23 April 1616. His parents removed to Madrid when he was about seven years old. Their limited means made it desirable that he should fix on some professional study, but he followed his irresistible inclination to poetry, which his teacher, Juan Lopez, encouraged. Elegies, ballads, sonnets, and a pastoral, *Fileña*, were the first productions of his poetical genius. Poverty compelled him to quit his country at the age of 22, to seek maintenance elsewhere; he went to Italy, where he became page to the Cardinal Giulio Acquaviva, in Rome. In 1570 he served under the papal commander, Marco Antonio Colonna, in the war against the Turks and African corsairs, with distinguished courage. In the battle of Lepanto, in 1571, he lost his left hand. After this he joined the troops at Naples, in the service of the Spanish king. In 1575, while returning to his country, he was taken by the corsair Arnaut Mami, and sold in Algiers as a slave. He remained in slavery for seven years, but servitude, far from subduing his mind, served to strengthen his faculties. Vincente de los Rios and M. F. Navarrete, his chief biographers, relate the bold but unsuccessful plans which he formed to obtain his freedom. In 1580 his friends and relations at length ransomed him. At the beginning of the following year he arrived in Spain, and from this time lived in seclusion, entirely devoted to the muses. It was natural to expect something uncommon from a man who, with inexhaustible invention, great richness of imagination, keen wit, and

a happy humor, united a mature, penetrating, and clear intellect, and great knowledge of real life and mankind in general. But it rarely happens that expectation is so much surpassed as was the case with Cervantes. He began his new poetical career with the pastoral novel 'Galatea' (1584), in which he celebrated his mistress. Soon after the publication of this he married. Being thus obliged to look out for more lucrative labor he employed his poetical genius for the stage; and in the course of 10 years furnished about 30 dramas, among which his tragedy called 'Numancia' is particularly valued. He was not so successful in another kind of drama particularly favored by the Spaniards, a tangled mixture of intrigues and adventures; and this was doubtless the cause of his being supplanted by Lope de Vega, who was particularly qualified for this kind of composition. He consequently gave up the theatre, but it seems not without regret. From 1588 to 1599 he lived retired at Seville, where he held a small office. He did not appear again as an author till 1605, when he produced the first portion of that work which has immortalized his name,—'Don Quixote.' Cervantes had in view by this work to reform the taste and opinions of his countrymen. He wished to ridicule that adventurous heroism with all its evil consequences, the source of which was the innumerable novels on knight-errantry. The beginning of the work was at first coldly received, but soon met with the greatest applause, in which, at a later period, the whole of Europe joined. Cervantes' true poetical genius was nowhere so powerfully displayed as in his 'Don Quixote,' which, notwithstanding its prosaic purpose and its satirical aim, is full of genuine poetry. While it struggles against the prevailing false romance of the time, it displays the most truly romantic spirit. The extraordinary good fortune of the work did not extend to the author. All his attempts to better his condition were unsuccessful, and he lived contented with his genius and his poverty, and a modest though proud estimation of his merits. After an interval of some years, he again appeared before the public in 1613, with 'Twelve Novels' (which may be placed by the side of Boccaccio's), and in 1614 his 'Journey to Parnassus'—an attempt to improve the taste of his nation. In 1615 he published eight new dramas, with intermezzos, which, however, were indifferently received. Envy and ill-will, in the meantime, assailed him, and endeavored to deprive the neglected author of his literary fame; for which the delay of the continuation of 'Don Quixote' afforded the pretext. An unknown writer published, under the name of Alonzo Fernandez de Avellaneda, a continuation of this work, full of abuse of Cervantes. He felt the malice of the act painfully, but revenged himself in a noble manner by producing the continuation of his 'Don Quixote' (1615), the last of his works which appeared during his lifetime; for his novel 'Persiles and Sigismunda' was published after his death. He found a faithful friend in the Count of Lenos, but poverty, his constant companion through life, remained true to him till his last moments. He died on the same day as Shakespeare, in Madrid, where he had resided during the last years of his life. He was buried without any cere-

mony, and not even a common tombstone marks the spot where he rests. In addition to his celebrity as an author, he left the reputation of a man of a firm and noble character, clear-sighted to his own faults and those of others. Among the best editions of 'Don Quixote' are the one published at Madrid by Joaquin Ibarra, in 1780, considered a masterpiece of typography; that of Pellicer (Madrid 1798), and that of D. Diego Clemencin, with an excellent commentary (Madrid 1833-9). Many of his works are translated; 'Don Quixote' into all the languages of Europe. Among the English translations may be mentioned those of Motteux (1719); Jarvis (1742); and Smollett (1755). Several noteworthy English translations have been made in recent years: by Duffield (1881); Ormsby (1885); and Watts, (1888-9), containing life of the author, notes, bibliography, etc.

Cervantes, Philippines, capital of the province of Lepanto, situated near the centre of the province in the northwestern part of the island of Luzon, 3 miles from Cayan, the former capital. It is on a road connecting it with Benguet, and is 78 miles from Dagupan, which is the nearest point on the railroad. Pop. 16,000.

Cervantite, or **Antimony Ocher**, is native antimony tetroxide, Sb₂O₄. It usually occurs in crusting stibnite and other antimony ores. It has a pale yellow color and greasy lustre.

Cervera y Topete, Pascual, pās'kwāl thār-bā'rā ē tō-pā'tā, Spanish naval officer: b. province of Jerez 18 Feb. 1833. He was of noble birth, his mother being a daughter of Count Topete y Valle. He was graduated at the Naval Academy of San Fernando; entered on active service in 1851; and was made first lieutenant in 1859; captain in 1868; and admiral subsequently. He was a prominent factor in the 10-years' war in Cuba, when he succeeded in blockading the ports and preventing the landing of filibusters; was sent to London as a representative of Spain to take part with other nations in a conference bearing on naval questions of international importance; and commanded the fleet sent against the American squadron operating in Cuban waters after the declaration of war in 1898. He took refuge in the inner harbor of Santiago de Cuba, and when, on 3 July, he attempted to escape, under imperative orders from his superiors, his entire fleet was destroyed by the squadron under the official command of Rear-Admiral Sampson and the actual command (in the temporary absence of that officer) of Rear-Admiral Schley. Admiral Cervera and his surviving officers were sent to Annapolis, Md., as prisoners of war, and soon afterward were released and allowed to return to Spain. He is a man of cultured and genial manners, of a kindly disposition and a gallant officer, for whom his captors felt the greatest admiration and sympathy.

Cervidæ, sēr'vī-dē, the deer family, a group of ruminant ungulates, including, besides the typical deer, the reindeer, the musk-deer, and others. The most noticeable characteristic of the entire group is the presence, in the males, or "bucks," of branched appendages to the skull, called antlers. These are, however, lacking in certain species, which, despite this fact, are very evidently closely related to the antlered deer. The antlered animals shed these

ornaments annually and develop new ones. (For growth and reproduction of these, see **ANTLERS**.) All deer have a large unossified space in the fore part of the skull which prevents the lachrymal bone from coming in contact with the nasal bone, as in the ox family. In the deer without antlers the upper canine teeth are especially well developed for defensive purposes; but they are generally present in all species; and, with the exception of the musk-deer, the *Cervidae* have no gall-bladders. Though not nearly so numerous as such families as that of the ox, the deer family includes a variety of genera and numerous species, widely distributed, so that we find representatives throughout the Old World, except in Australia and southern Africa, and in both continents of the New World. Deer are generally found in forests or grass-lands, and never in deserts. They are, historically considered, older than the other families of ruminants, dating back to the Lower Miocene Period, when they were very small and without antlers. With the gradual change in other directions, such as the variation in dentition and the increased size, the antlers have been produced and amplified, so that the deer of the present is a far larger and finer-looking animal than his fossil ancestor. In the matter of antlers the young *sag* typifies the evolution of the race; as a yearling, his antlers are merely one-pronged spikes; but each successive year they become more branched and forked until, at maturity they may have seven or even more branches.

All deer are supplied with a coat of short fur, dull in tone, for protection, ranging from reddish-brown to gray; and usually white below. Those that are marked bear such markings on the face and throat and on the tail. Only a few genera are spotted. In most genera only the young (the fawns) are spotted; and lose their spots when they are about one year old. Deer breed annually, the young, one or two at a birth, being produced in late spring. The fawns remain with their mothers until they are about a year old, when they are sufficiently mature to become independent. The grass-land deer, especially, are gregarious, and often gather in large herds at the approach of winter. These feed on the meadow herbage, whereas the forest deer eat the leaves, twigs, and buds of bushes. In all, about 60 species are known. They are included within the following genera: *Cervus*, the red deer; *Cervulus*, the Asiatic muntjac; *Elaphodus*, the tufted deer; *Rangifer*, the reindeer; *Alces*, the elk; *Capreolus*, the roe-deer; *Hydropotes*, the water-deer; *Cariacus*, the American deer; *Pudua*, the Andean deer; and *Moschus*, the musk-deer. All these, except *Moschus*, form the sub-family *Cervina*; *Moschus*, by itself, forms the sub-family *Moschina*. See **DEER**, and the English names of the various species.

Cervin, Mont (German, *Matterhorn*; Italian *Monte Silvio*), a mountain, Switzerland, Pennine Alps, on the southern frontiers of canton Valais, about six miles west-southwest of Zermatt, from which a road leads to the Col St. Theodule, a pass over the mountain into Piedmont. It is one of the most magnificent objects in nature, being an almost inaccessible obelisk of rock starting up from an immense glacier, to a height scarcely 1,000 feet lower

than that of Mont Blanc. The glacier, which differs from the lower glaciers in not being included between bold walls, but occupying a vast and desolate table-land, is nearly 10,000 feet above sea-level. The height of the peak is 14,837 feet. It is composed of felspar slate or gneiss. The peak was first ascended by a party of four English travelers and three guides in July 1865, but three of the party and a guide perished in the descent. (See Whympers 'Scrambles Among the Alps'). On the summit of the pass, 11,006 feet, are the remains of a rude fortification, supposed to have been erected two or three centuries ago, to prevent incursions from the Valais.

Cervolle, or Cervole, Armand de, är-män dè sër-völ, French bandit chief, surnamed 'The High Priest.' He was taken prisoner with King John at the battle of Poitiers in 1356, and after being ransomed, plundered the south of France with a band of troopers (*routiers*), and exacted tribute from Innocent VI. at Avignon. He served for a time under the Dauphin; pillaged Burgundy, Champagne, Alsace, and Lorraine; was made Chamberlain to Charles V. in 1365; and was murdered in 1366.

Cesalpino, or Cæsalpin, Andrea, än'drà-ä chä-zal-pē'nō, Italian botanist and physiologist: b. Arezzo, Tuscany, 1519; d. Rome 23 Feb. 1603. He studied and taught medicine and botany at the University of Pisa, and was physician to Pope Clement VIII. He was the author of a valuable work 'On Plants,' in which he classified plants by their parts of fructification. To this work Linnaeus, Jussieu, and other subsequent botanists were greatly indebted for their ideas of botanical classification. In his 'Peripatetic Investigations' he propounded the theory of the circulation of the blood, afterward adopted and demonstrated by Harvey.

Cesar Birotteau, sâ-zär bē-rôt-tō, **The Greatness and Decline of**, a novel by Honoré de Balzac. It portrays in a striking and accurate manner the bourgeois life of Paris at the time of the Restoration.

Cesares'co, Countess Martinengo. See **MARTINENGO-CESARESCO, COUNTESS**.

Cesari, Giuseppe, joo-sēp'pē chā zä rē (sometimes called IL CAVALIERE D'), Italian painter: b. Arpino about 1568; d. Rome 3 July 1640. He was greatly honored by no less than five Popes. His works—in fresco and oil—display lively imagination, and great tact in execution.

Cesarotti, Melchior, mēl-kē-ō'rē chā-zä-rôt'tē, Italian poet and scholar: b. Padua 15 May 1730; d. Solvaggiano 3 Nov. 1808. He devoted himself to the belles-lettres, and was soon chosen professor of rhetoric in the seminary in which he was educated. He translated three tragedies of Voltaire,—*Sémiramis*, *'La Mort de César*, and *'Mahomet*.' In 1762 he went to Venice, where he translated Ossian into Italian, and was, in 1768, appointed professor of the Greek and Hebrew languages in the University of Padua. Here he published his translation of Demosthenes and of Homer, and his course of Greek literature. After the establishment of the republican government, in 1797, he was appointed by the existing authorities to write an 'Essay on Studies.' In this he made suggestions for the improvement of education. In

1807 appeared his poem called 'Pronea' (Providence), in praise of his benefactor, Napoleon, who made him the same year knight of the Iron Crown. In spite of his advanced age he subsequently occupied himself with an edition of all his works; but his death prevented the completion of this enterprise. The edition of his works that had been begun during his life was completed by his friend Giuseppe Barbieri (1805-13).

Cesena, chā-zā'nā, Italy, a city in the province of Forlì, central Italy, on the right bank of the Savio. Among its buildings are a library founded in 1452 by Domenico Malatesta Novello, which possesses 4,000 precious manuscripts; a Capuchin church containing one of the best of Guercino's paintings, and a noble cathedral. Productive sulphur mines are in the neighborhood; and the region has been noted ever since Roman times for the excellence of its wine. Cesena was the birthplace of Popes Pius VI. and VII. In 1357, under Maria Ordelaffi, it made a famous defense against Alborno; but in 1377 it was barbarously pillaged by Robert of Genf. On 30 March 1815, Murat gained a victory at this place over the Austrians. Pop. 12,000.

Cesium. See **CÆSIUM**.

Ce'sius, Bernar'dus, Italian philosopher: b. Modena about 1581; d. there 1630. He became a professor of philosophy and theology at Parma, and afterward at Modena, where he died of the plague. He is best known by his work entitled 'Alimnologia, sive Naturalis Philosophiæ Thesauri; Lugduni' (1636), in folio, which contains no important observations by the author himself, but is useful as being a laborious collection of everything relating to the mineralogy of the ancients, and as showing what minerals were familiarly known during the author's time.

Cesnola, Luigi Palma di, loo ē'jē pāl mā dē chēs-nō'la, American archaeologist: b. Piedmont, Italy, 29 June 1832. He served in the Italian war with Austria and came to the United States in 1860, serving in the Civil War, and attaining the rank of brigadier-general. He was United States consul at Cyprus (1865-77), where he made extensive archaeological discoveries. In 1878 he became a trustee and director of the Metropolitan Museum of Art, in New York, a post he has since held. In 1897 he was awarded a Congressional medal of honor for conspicuous military service. He has written 'Cyprus: Its Cities, Tombs, and Temples,' and many monographs on art topics.

Céspedes, Pablo de, pāb'lō dā thēs'pā-dēs, Spanish painter, sculptor, architect, and poet: b. Cordova 1538; d. there 26 July 1608. In 1556 he entered the University of Alcalá de Henares, where he distinguished himself by his proficiency in the classics and Oriental languages. He also assiduously cultivated his genius for the fine arts. Having at last made these his principal pursuit, he proceeded to Rome, studied under Zuccherò and Michael Angelo, and soon became renowned both for his frescoes and sculptures. In 1577 he obtained a prebend in the Cathedral of Cordova, and from that time resided alternately in his native town and in Seville. His best pictures are in Cordova, Seville, Madrid, and several towns of Andalusia;

and are admired particularly for elegance and loftiness of design, complete knowledge of anatomy, the skilful employment of light and shade, warmth of coloring, accuracy of expression, and spirituality of composition. One of his most celebrated pictures is a 'Lord's Supper,' in Cordova Cathedral. He was the head of the then Andalusian school of painting, and numbered among his pupils some painters of distinction.

Céspedes y Borges, ē bōr'-gās, Carlos Manuel de, Cuban insurgent: b. Bayamo 18 April 1819; d. 22 March 1874. He studied at the University of Havana, and later at Barcelona, Spain. Implicated in Prim's conspiracy, he was banished from Spain (1843), and returned to Cuba to practise law. As leader of the revolt of 1868, he was chosen by the insurgents president of the newly proclaimed republic. He was killed in a skirmish with the Spaniards.

Cessart, Louis Alexandre de, loo'ē ā-lēks-āndr dē cēs-sar, French engineer: b. Paris 1719; d. 1806. He early entered the military service, and distinguished himself in the campaigns of 1743-6, during which he was present at the battles of Fontenoy and Rocoux. Bad health having obliged him to obtain his discharge, he entered the École des Ponts et Chaussées, where he displayed so much genius and industry, that in 1751 he was appointed general engineer of Tours. In 1775 he was removed to Rouen, and in 1781 proposed his plans for the construction of the harbor and works of Cherbourg. These have immortalized his name. He died while engaged in preparing a description of his most important labors. The work was published under the title of 'Description des Travaux Hydrauliques de L. A. Cessart' (1806-9).

Cessio Bonorum, sēs'hī-ō bō-nō'rūm ('surrender of goods'), a process by which, according to the law of Scotland, a debtor against whom a warrant of imprisonment was issued after being charged to pay his debt, was entitled to be free from imprisonment, if innocent of fraud, on surrendering his whole estate to his creditors. Since the abolition of imprisonment for debt a debtor may be compelled to make *cessio bonorum* at the instance of a creditor.

Ces'tius, the name of a plebeian gens at Rome, of which two memorials have been preserved, one of them a bridge connecting the island of the Tiber with the right bank of that river, and the other a monumental pyramid standing at the gate San Paolo, partly within and partly without the walls of Aurelian. This pyramid stands upon a base of travertine. It is 125 feet high, and at the base 95 feet broad. It is built of bricks, encased in blocks of marble. In its interior there is a sepulchral vault 20 feet long, 13 feet broad, and 14 feet high. The walls of this vault were formerly decorated with paintings, but these are now faded, and only a few traces of them are still discernible. Two marble pillars which formerly supported the statue of the person whom the monument commemorates, stand in front of the pyramid. From the inscriptions still seen upon it, it has been inferred that the Cestius who caused this magnificent monument to be erected was a Roman knight of that name who lived in the

CESTODA — CETACEA

time of Cicero, and who, having enriched himself in Asia Minor, left part of his wealth for the purpose of perpetuating his memory in this way.

Cesto'da, a class of the phylum *Platyhelminthes*, represented by the tape-worms (q.v.). They are parasitic, usually ribbon-like worms, without any mouth or digestive canal, but with a slightly developed nervous system and an (excretory) water-vascular system. They are hermaphrodite, the joints as a rule numerous and containing male and female reproductive organs; the eggs are minute and very numerous. The mature worm is many-jointed, the joints budding out from near the head; in this form it is called a "strobila"; the terminal joints fall off, becoming independent (proglottis). The eggs, after fertilization, pass through a morula and gastrula stage, a circle of six hooks and suckers developing on the head and forming the *scolex*, or organ of attachment. They live as parasites in birds, beasts, and man, their earlier stages being passed in the bodies of a different host, as fishes, etc.

The Cestoda are divided into five families: (1) *Caryophyllaidæ*; (2) *Ligulidæ*; (3) *Tetrarhynchidæ*; (4) *Tetraphyllidæ*; (5) *Bothriocephalidæ*; (6) *Taniadæ*, the last group being represented by the common tape-worm of man (*Tania solium*). Consult: Leuckart, 'Die Menschlichen Parasiten,' two volumes; Braun, 'Die Tierischen Parasiten des Menschen'; Linton, 'Notes on Entozoa of Marine Fishes of New England'; 'Reports of the United States Commission on Fish and Fisheries,' Parts I., II.; Stiles and Hassall, 'A Revision of the Adult Cestodes of Cattle, Sheep, and Allied Animals' (Bulletin 4 of the United States Department of Agriculture).

Cestracion, sēs-trā'si-ōn, a genus of cartilaginous fishes allied to the sharks, of which the best known species is the Port Jackson shark of Australia (*C. philippi*). Four species are known, varying in length from four to five feet. They feed mainly on various kinds of mollusks. The family *Cestraciontidae*, though now poorly represented, was very abundant in the earlier geological periods.

Ces'tus ("girdle"), a band or zone said to have been worn by Aphrodite or Venus, and endowed with the power of exciting love toward the wearer. The following is Pope's translation of Homer's description of it:

In it was every art and every charm
To win the wisest, and the coldest warm—
Fond love, the gentle vow, the gay desire,
The kind decent, the still-reviving fire,
Persuasive speech, and more persuasive sighs,
Silence that spoke, and eloquence of eyes.

Cestus, or **Cæstus**, the boxing-glove of the Grecian and Roman pugilists. It consisted of thongs or bands of raw hide or leather, fastened to the hand, and reaching to the wrist. It was afterward enlarged so as to reach up to the elbow, and loaded with metal to increase the weight of the blow. The combat with the ordinary unloaded cestus was not more dangerous than a common modern boxing-match. Theocritus (Idyll. xxii.) has described one of these combats.

Cetacea, sē-tā'se-ā, an order of mammals whose structure is so modified as to render them

fit for an aquatic life. The whale-bone whales, the toothed whales, as the porpoise, narwhal, etc., and the extinct Zeuglodon, represent the leading divisions of the group. The body is fishlike in form, the head passing gradually into the trunk which tapers posteriorly and ends in a bilobate caudal fin which is placed horizontally, not as in the fishes, vertically. The posterior limbs are wanting, and the anterior are converted into broad paddles or flippers, consisting of a continuous sheath of the thick integument, within which are present representatives of all the bones usually found in the fore limb of mammals, but they are not movably articulated, so that the paddle moves like a solid oar. The fish-like aspect is further increased by the presence of a dorsal fin; but this is a simple fold of integument, and does not contain, as in fishes, any bony spines. The vertebrae of the neck, seven in number, are united more or less to each other, so that in some they form a single solid piece. The right whale and its allies have no teeth in the adult state, their place being taken by the triangular plates of baleen or whalebone which are developed on transverse ridges of the palate. The frayed edges of these plates slope obliquely downward and outward from the middle of the roof of the mouth, so that when the mouth is shut there is a triangular space in the middle, the floor of which is formed by the enormous tongue. The water taken into the mouth is sifted by the frayed edges of the plates; it is driven out sideways between the plates and the tongue sweeps backward to the gullet any animals that have been caught in the fringes. But the fetal whales possess minute teeth, which are very soon lost. The porpoises, etc., when they possess teeth in one or both jaws, have them numerous and conical in form; they have no milk predecessors. The stomach is divided into several chambers, but these are not, as in ruminants, connected directly with the gullet; they are rather appendages of the pyloric portion of the organ.

The arrangement of the respiratory and circulatory systems, which enable the Cetacea to remain for some time under water, are interesting. The nostrils open directly upward on the top of the head, and are closed by valvular folds of integument which are under the control of the animal. When the animal comes to the surface to breathe it expels the air violently, and the vapor it contains becomes condensed into a cloud; if the expiration commences before the mouth of the spiracle or blow-hole is above the surface, a little water may be blown up like spray but no water from the mouth is thus discharged, for the soft palate firmly embraces during life the upper end of the larynx, so that the gullet is divided into two narrow passages, while the lungs have a continuous passage to the exterior. The blood vessels, especially those of the thorax and spinal canal, break up into extensive plexuses or networks, in which a large amount of oxygenated blood is delayed, and thus the animal is enabled to remain under water, the necessity for changing the air in the lungs being diminished.

Fossil Cetacea.—Bones of cetaceans, mostly allied to the living species, are found in the marine sediments of the Tertiary and Quaternary ages, and are occasionally dredged up from deep-sea deposits. The hard and heavy ear-

CETEWAYO — CEVALLOS

bones are especially apt to be preserved as fossils. The zeuglodons and squalodons of the Eocene epoch represent a peculiar primitive group of cetaceans with two-rooted teeth. Very little is known of the evolution of this order of mammals.

Classification of Cetacea.—The sub-orders of cetacea are as follows:

1. *Mystacoceti*, baleen-bearing whales. Its families are: *Balaenopteridae*, rorquals, and other great whalebone whales; *Balaenidae*, right whales and kogias.

2. *Odontoceti*, of which the families are: *Physeteridae*, sperm-whales (*Physeterinae*), and beaked whales (*Ziphiinae*); *Delphinidae*, dolphins, porpoises, white whales, killers and the like; *Platanistidae*, river dolphins; and the extinct *Squalodontidae*.

3. *Archæoceti*, containing the extinct family *Zeuglodontidae*. The most recent and important work on this order is Beddard's 'Book of Whales' (London 1900). See WHALE, and the names of the various groups and species of cetaceans.

Cetewayo, sēt-ī-wā'yō, Kaffir chief or king, son of Panda, king of the Zulus: d. Ekowe 8 Feb. 1884. Disturbances as to the succession having arisen in Zululand, Shepstone, the representative of the Natal government, secured the recognition of Cetewayo as king in 1873. The latter, however, in spite of the obligations into which he had entered, proved a tyrannical ruler, and maintained a large army. A dispute which had arisen regarding lands on the frontier was settled by arbitration in favor of the Zulus; but on the refusal of Cetewayo to comply with the conditions imposed, war was declared against him by the British, and the king made prisoner soon after the battle of Ulundi, July 1879. In 1882 he visited England and was conditionally restored to part of his dominions. In the following year he was driven from power by the chief Ushepu, and remained under the protection of the British until his death.

Cethe'gus, Cai'us Corne'lius, Roman conspirator, one of the associates of Catiline. He was put to death in prison by order of the senate, at the instigation of Cicero, 68 B.C.

Cetinje. See CETTIGNE.

Cetiosaurus, sēt-ī-ō-sā'rūs, a genus of amphibious dinosaurs (see DINOSAURIA), of which fragmentary remains have been found in the Lower Cretaceous (Wealden) of Europe.

Cette, sēt, France, a seaport town in the department of Hérault, built on a neck of land between the lagoon of Thau and the Mediterranean, 23 miles southwest of Montpellier. The space enclosed by the piers and breakwater forming the harbor can accommodate about 400 vessels; and the harbor is defended by forts St. Pierre and St. Louis. A broad, deep canal, lined with excellent quays, connects the port with the Lake of Thau, and so with the Canal du Midi and the Rhone, thus giving to Cette an extensive inland traffic; and it has an active foreign commerce. The principal trade is in wine, brandy, salt, dried fruits, fish, dyestuffs, perfumery, and verdigris. Cette has shipyards, salt-works, glass-works, factories for the manufacture of syrups and grape sugar, etc., and carries on extensive fisheries. After Marseilles,

it is the principal trading port in the south of France; and it is much resorted to as a watering place. Pop. (1901) 33,065.

Cettigne, tsēt-tin'yě, or **Cetinje**, chět tēn'yā, Montenegro, the capital of the principality; situated in a lofty mountain valley, 19 miles east of Cattaro. It contains the palace of the ruler and the government buildings, a convent founded in 1478, a girls' institute and other schools, an arsenal, and a theatre. Turkish invaders sacked and burnt the town in 1683, 1714, and 1785. Many famous Montenegrin rulers lie buried here. Pop. about 3,500.

Ce'tus (Lat. whale), a large constellation lying on both sides of the equator, but mostly south of it, one of Ptolemy's original 48. It is surrounded by Pisces, Aries, Taurus, Eridanus, Fornax, Sculptor, and Aquarius. It contains the remarkable variable star Omicron Ceti, or Mira.

Cetyl, sē'til, an alcoholic radical not yet thoroughly isolated, but supposed to exist in a series of compounds obtained from spermaceti.

Ceuta, thā'oo ta, Morocco, a strongly fortified place belonging to Spain, on the coast of Africa, opposite Gibraltar. The town occupies the site of the Roman colony of *Ad Septem Fratres*, so called from the seven hills rising here in a group, of which the most prominent are Montes Almina and Hacho; on the latter, the ancient Abyla (one of the Pillars of Hercules), is a strong fort, and on the former, among beautiful gardens, lies the New Town. Ceuta contains a cathedral, a hospital, and convents, but is chiefly of importance as a military and penal station. The place was a flourishing mart under the Arabs, and there the first paper manufactory in the Western world is said to have been established by an Arab who had brought the industry from China. In 1415 it was captured and annexed by the Portuguese, and fell to Spain in 1580. It has resisted several sieges by the Moors (1694-1720 and 1732), and is still the most important of the four African presidios. Pop. about 14,000.

Ceva, Tommaso, tōm-mā'sō chā'vā, Italian mathematician and poet: b. Milan 20 Dec. 1648; d. 3 Feb. 1736. He was admitted into the order of Jesuits in 1663, and spent his life as an instructor in various colleges. His more important mathematical works had reference to angles, for the trisection of which he invented a mechanical instrument. He wrote several biographies in Italian, and many poems in Latin and Italian, two of which, entitled 'Philosophia novantiqua'; and 'Puer Jesus', are still admired.

Cevallos, Pedro, pā'drō thā-val'lōs, Spanish diplomatist: b. Santander, Biscay, 1761; d. Seville 29 May 1838. He studied at Valladolid, and entered on a diplomatic career. Having been appointed secretary to the embassy at Lisbon, he there married a niece of Manuel Godoy, Duke of Alcudia, the Prince of Peace, and became afterward minister of foreign affairs. In the disputes between Charles IV. and his son Ferdinand he adhered to the latter. Aware of the influence which Cevallos possessed over the Spanish people, Joseph Bonaparte was anxious to gain him over, and offered to take him into his service. Cevallos accepted with apparent willingness, but on arriving at Madrid

CEVALLOS—CEYLON

united with the Spanish *junta* against Joseph, and was sent by them on a mission to London, where in 1808 he published his celebrated work on Spanish affairs, referring more especially to the proceedings at Bayonne. After the Restoration he for some time maintained a great influence over Ferdinand, but on his opposing the marriage of the latter with a princess of Portugal he lost favor, was deprived of his office of secretary of state, and sent as ambassador to Naples and Vienna. On being recalled in 1820 he retired to private life.

Cevallos, Pedro Fermin, Ecuadorian lawyer and historian: b. Ambato about 1814. Besides holding several high professional positions he was a senator in 1867. His principal work is: '*Resumen de las historia del Ecuador*,' in five volumes.

Cévennes, sā-vën, France, a southern district, which at one time formed the northern part of the government of Languedoc. During the wars against the Albigenses its mountains and valleys were the asylum of numerous persons who had renounced many of the beliefs of the Roman Catholic Church. It now forms part of departments Haute-Loire, Loire, Ardèche, Gard, and Aveyron.

Cévennes, sev-en' (ancient CEBENNA), the chief mountain range in the south of France. With its continuations and offsets, it forms the watershed between the river systems of the Rhone and the Loire and Garonne. Its general direction is from northeast to southwest, beginning at the southern extremity of the Lyonnais Mountains, and extending under different local names as far as the Canal du Midi, which divides it from the northern slopes of the Pyrenees. The Cévennes extend for over 150 miles, through or into nine departments, the central mass lying in Lozère and Ardèche, where Mount Lozère attains 5,584 feet, and Mount Mézen (the culminating point of the chain) 5,754 feet. The average height is from 3,000 to 4,000 feet. The mountains consist chiefly of Primary rocks, covered with Tertiary formations, which in many places are interrupted by volcanic rocks.

Ceylon (native SINGHALA, ancient TAPROBANE, an island possession and crown colony of Great Britain, in the Indian Ocean, about 60 miles southeast of the southern extremity of Hindustan, from which it is separated by the Gulf of Manaar and Palk Strait. It lies between lat. 5° 56' and 9° 50' N., and between lon. 80° and 82° E., having the shape of a pear, with the broad end south. Length, about 270 miles north to south; average breadth, 100 miles; area, 25,364 square miles. The northern and northwestern coasts are flat and monotonous, those on the south and east bold and rocky, presenting a highly picturesque appearance, which is further heightened by the exuberant vegetation, the noble palm forests, the luxuriant corn fields, and the verdant slopes of the mountains enameled with bright flowers, herbs, and creeping plants, whose delicious perfume spreads far and wide. Many parts of the coast, at its southern and northern extremities are studded with small, rocky, and verdant islands, some of them overgrown with palms, and presenting a singularly beautiful appearance. At Trincomalee, on the northeastern coast, there is one of

the finest natural harbors in the world; at Galle on the southern coast there is also a harbor; while the harbor at Colombo, the capital, is capable of admitting the largest vessels, and is now the regular calling-station for mail steamers to and from Calcutta, China, and Australia. Between the islands of Manaar on the northwestern coast of Ceylon and the island of Ramiseram on the coast of India, is a ridge of sandbanks called Adam's Bridge, which nearly connects Ceylon with the continent, being intersected only by three narrow shallow passages, the remainder being covered with two or three feet of water at full tide. These channels admit only very small vessels, but ships of some size can get through between Ramiseram and the mainland; and schemes for the passage of larger vessels have been projected, as also for a railroad along Adam's Bridge.

Mountains.—The mountainous regions of Ceylon are confined to the centre of the south and broader part of the island. They gradually diminish to hills of moderate elevation as they recede from the central mass, and are succeeded on the western side by a flat tract extending to the coast. Their average elevation is somewhere about 2,000 feet, but there are several summits upward of 7,000 and 8,000 feet high. The highest summit is Pedrotallagalla (8,260), but Adam's Peak, reaching 7,420 feet, is the most remarkable from its conical form, the distance from which it is visible from the sea, and from the sacred associations with which it is connected, the summit being the point from which Buddha, according to his followers, ascended to heaven, a gigantic footprint bearing testimony to the fact. Other summits are Tolapella (7,720) and Kirrigalpota (7,810). The forms of the mountains of Ceylon are singularly varied. They most frequently occur connected in chains, and terminate in round or peaked summits. Their sides are always steep and occasionally precipitous and rocky. There is no proportional correspondence between the heights of the mountains and the depths of the adjoining valleys, and often the valleys are extremely narrow. The deepest are in the heart of the mountains. Some are between 3,000 and 4,000 feet deep, and not over half a mile wide.

Rivers and Lakes.—The rivers of Ceylon, though numerous, especially on the southern and southwestern sides, are small, being merely mountain streams, navigable only by canoes, and that but for a short distance from their mouths. The Mahaveli-ganga, which rises near Adam's Peak, and falls into the sea by a number of branches near Trincomalee, is by far the most important. It has a course of 134 miles, and drains upward of 4,000 square miles. Timber grows on its banks in great abundance, consisting of halmalille, ebony, satin-wood, etc., which is floated down to the harbor during the freshets. Of the remaining rivers the Kalaniganga, the Kala-ganga, and the Maha Oya reach the sea on the western coast; and the Gintota-ganga at Galle. All the rivers are liable to be surcharged with rain during the monsoon, and to inundate the level country, while the heat of the sun on drying the country produces malaria. There are numerous extensive lagoons or back-waters round the coasts, but no lakes in the island worth noticing, the largest being only four miles broad. There are rills and streamlets rushing along in every direction among the mountains,

CEYLON

so overhung with superabundant vegetation as to be frequently invisible.

Geology and Mineralogy.—Ceylon is mostly formed of ancient stratified rocks, but owing to the obliteration of fossil remains it is doubtful whether they have been deposited on the beds of seas or lakes. The mountains are composed of Primary and metamorphic rocks, the prevailing rock on the island being gneiss, though laterite (or "cabook") and a sort of dolomite also occur in considerable quantity. In the Nuwara-Eliya district and elsewhere there are large alluvial tracts. Basalt is found near Galle and Trincomalee, and at Pettigallakanda an ancient lava occurs. The soil is mostly formed from the disintegration of gneiss. The western coast of the island is believed to be rising. Plumbago is found in sufficient quantities to make it of commercial importance, anthracite is obtained, and among the metals occurring in the island are iron in fair quantity, manganese, gold, platinum, molybdenum, nickel, cobalt, copper, and tin. No coal has been found, but nitre and salt occur (the latter is also a somewhat important article of manufacture). Gems of many kinds are abundant, particularly near Ratnapura. They are found either embedded in the rock or washed down in the alluvium of river-beds, and include zircons, amethysts, cat's-eyes, topazes, moonstones, garnets, spinel, sapphires, rubies, cinnamon stones, etc. There are hot springs at Bintenna, Trincomalee, and Puttalam.

Roads and Transportation.—Ceylon is now well provided with roads. A highway has been made from Colombo to Nuwara-Eliya, 6,000 feet above the level of the sea. A continuous line, 769 miles in length, makes the entire circuit of the coast, and every town of importance is connected by roads with the two chief cities. The roads in general are good, many of them being macadamized, and in the neighborhood of the chief towns are adapted for carriages. During the monsoons, however, the roads in many parts are impassable from inundations. The building and maintenance of roads, bridges, streets, and canals forms one of the chief items of expenditure of the government. Railroad extension is also a government affair, and there are now about 300 miles in all, the main line being that between Colombo and Kandy (75 miles). In the early part of the 19th century there was not a single road in the country, merely a few pathways, the greater part of the island being then covered with impenetrable forests.

Climate.—Where the jungle has been cleared away and the land drained and cultivated, the country is perfectly healthy; where low wooded tracts, and flat marshy lands abound, covered with a rank, luxuriant vegetation, the climate is eminently insalubrious, showing, what is now pretty well understood, that mere heat has little to do with the unhealthiness of tropical climates. The heat is not so great as on the neighboring coast of India, the sea-breezes moderating the temperature. At Colombo, on the western side of the island, near the seventh parallel of north latitude, the mean daily variation of the temperature does not exceed 3°, and the annual range is from 76° to 86° 30' F. At Nuwara-Eliya (6,000 feet high) the annual range is from 32° to 80°. The eastern part of the island, being exposed to the northeastern monsoon, has a hot and dry climate, resembling that of the coast of Coromandel; while the

western division, being open to the southwestern monsoon, has a temperature and humid climate like that of the Malabar coast. The quantity of rain that falls annually in Ceylon is estimated at three times the quantity that falls in England, the rains being less frequent, but much heavier. The interruption which the course of the monsoons meet with from the mountain ranges of the island causes deluges of rain to fall on one side, while the other is parched with drought. At Kandy, in the interior, the average annual fall of rain is 85.3 inches; at Colombo, on the seacoast, 75 to 80 inches. The prevalent diseases are those of the liver and intestines, often accompanied by fever. Elephantiasis and other cutaneous complaints are common. The very fatal disease called beriberi (*Hydrops asthmaticus*) occasionally occurs, being almost peculiar to the island.

Animals.—Most of the animals found on the opposite continent are native to this island, excepting the royal tiger, which does not exist here. Elephants are numerous, especially in the northern and eastern provinces, where they sometimes do great injury to the growing crops. The elephants of Ceylon are esteemed for their superior strength and docility. The eagerness with which they are hunted has greatly diminished their numbers. Since 1869 licenses for the capture and exportation of elephants must be obtained from the government. Bears, buffaloes, leopards, jackals, monkeys, and wild hogs, are numerous. There are several species of deer, of which the elk and fallow deer (properly the great red Sambar and spotted axis) are most abundant. Porcupines, bandicoots, squirrels (flying and other), bats, mungoses, are to be found, as are also the pangolin or scaly anteater, and the loris or Ceylon sloth. Flying-foxes and rats are numerous. Pheasants, snipes, partridges, pigeons, peacocks, and a great variety of birds, of splendid plumage, are plentiful. Crocodiles, serpents, and reptiles of all sorts abound. Of the snake tribe, consisting of about 26 different species, six only are venomous. Among the insects are the leaf and stick insects, the ant-lion, the white ant, etc.

Vegetable Products.—In the luxuriance of its vegetable productions, Ceylon rivals the islands of the Indian Archipelago, and in some respects bears a strong resemblance to them; its most valuable products are tea, rice, coffee, cinnamon, and the cocoanut. Coffee used to be the chief cultivated crop, but disease has within recent years much reduced the product. Cinnamon grows in the southwest, to which it is almost exclusively confined, requiring a sandy soil with a moist atmosphere. The trade in this spice was reserved as a government monopoly by the Dutch when they had possession of the island; all that was collected beyond the quantity which it was thought could be sold at a monopoly price being burned. This absurd system was followed by the English for some years after their conquest of Ceylon, but was abandoned in October 1832, when the trade in cinnamon was declared free, subject to a duty on exportation. The cocoanut-trees grow along the entire western and southern coasts in countless numbers, each tree producing from 50 to 100 nuts in the year. Every part of this invaluable tree is capable of being turned to profitable account. The Palmyra palm, which grows principally in the northern part of the island, is of

CEYLON

hardly less importance than the cocoanut, being productive in seasons of drought, when the crops fail. The jaggery palm, or kittul-tree, is cultivated for the sake of its sap, which yields a coarse sugar; its pith furnishes a kind of sago; and its fruit is also eaten. The talipot palm also abounds, as do the jack- and breadfruit-trees, the fruit of which is used by the natives for food, both raw and cooked; the timber, also, of the jack-tree, not being subject to be attacked by the white ant, is much used by the natives for making furniture, and in house-building. The Ceylon areca nut, celebrated for its superior qualities, is exported in large quantities. Tobacco is raised principally in the northern district, and is of excellent quality. Indigo grows wild, but is not sought after. The cardamom plant is abundant, but inferior to that of Malabar; fruits and culinary vegetables are produced, the latter in the elevated districts, in great variety and profusion. The island abounds with timber of various descriptions, including calamander, satin, rose, sapan, iron, jack, halmalille, and other beautiful woods adapted for cabinet work. Agriculture generally, and the cultivation of the more valuable native products of the island in particular, are improving. As already stated, coffee once was the chief crop, but latterly the cultivation of tea, cinchona, and cacao has been carried to such an extent that the island has become less dependent on a single article of produce. Notwithstanding the acknowledged fertility of Ceylon, the capabilities of its soil where justice is done to it, and the efforts now in progress to develop these capabilities, by far the largest proportion of the island is still uncultivated. There are a few natives who possess considerable estates in land; but the law of inheritance has, for the most part, caused a minute subdivision of the soil, to a degree very unfavorable to its improvement. The British government claims the proprietorship of all the waste lands, which are now disposed of by public sale. Among works carried on by the government are irrigation works in suitable localities, including the cutting of channels, the construction of annicuts or dams, and the formation and repair of tanks. Some of the ancient works of this kind are of great magnitude. There is also a government forest department, part of the work of which is to provide fuel for the railroads and timber for government works.

Pearl-fishery, etc.—There has long been a pearl-fishery on the coast of Ceylon, carried on as a government monopoly. The fishery sometimes fails for years, there having been none, for instance, between 1837 and 1854, or between 1863 and 1874. Although the government still continued a strict surveillance over the banks, and occasionally subjected them to a careful examination, scarcely any trace of the pearl oyster was to be found. No cause has yet been discovered for this disappearance. When the pearl-fishery is in existence it is confined to the Gulf of Manaar, where the oyster banks extend for 60 or 70 miles along the coast south of Manaar, and perhaps 10,000 people, including 2,500 divers, will assemble in the fishing season. The Ceylon pearls are whiter than those of Ormuz or the Arabian coast. The chank or conch fishery was at one time carried on to a great extent, employing about 600 divers, but has greatly declined owing to the little demand

now made for them in Bengal, to which the greater part were sent. The chank is a sea-shell (*Volva pyrum*), adapted for cutting into rings, these being formerly used in great numbers by the native women of Hindustan for bracelets and anklets.

Manufactures and Trade.—The manufactures of Ceylon are very unimportant with exception of arrack, which is distilled from the juice of the cocoanut-tree. The spinning and weaving of cotton goods, generally of the coarsest kind, was at one time a considerable industry, but is now dying out. There are numerous oil-mills for pressing the cocoanut kernels to express the oil. The Singhalese make good artisans, as is experienced at Colombo, where they are employed in making steam engines and other machinery. They are skilful in carpentry and wood-work, expert workers in gold and silver, and excel in the manufacture of lacquered ware. Salt is a government monopoly, being collected from shallow lagoons, which at certain seasons are overflowed by the sea, or it is manufactured in pans, the property of the government. The exports are chiefly tea, coffee, cinchona, cinnamon, cocoanut products, areca nuts, cacao, cardamoms, plumbago, tobacco. Tea has only begun to be exported in recent years, and the export has increased from 2,392,975 pounds in 1884, to more than 130,000,000 pounds. The total value of exports in 1899 was about \$56,000,000; of the imports about \$51,000,000. The trade of Ceylon is chiefly carried on with Great Britain and India, the former of which received from the island in 1899 goods approximating in value to \$26,000,000, and sent thither goods to the value of over \$7,000,000. The chief article exported to Great Britain is tea, the value of which in 1899 reached nearly \$19,000,000. The only other exports thither worth mention are coffee, cocoanut oil, and plumbago. The principal articles of import from Great Britain are coal, cotton manufactures, apparel and haberdashery, iron and steel manufactures, machinery, etc. The value of imports from Great Britain of manufactured cotton goods in 1899 was \$1,138,000; of wrought and unwrought iron, \$700,000; of coal, \$975,000. From other countries are imported rice, dried fish, wheat, sugar, and various other commodities.

Government, etc.—The government of Ceylon is conducted by a governor and two councils, executive and legislative, of both of which the governor is president. The first is composed of 6 members, including the governor; the other of 17 members, including the members of the Executive Council, 4 other office-holders, and 8 unofficial members selected by the governor as representative of the different classes and interests in the community. The powers of the councils are limited, being wholly subservient to the governor, who can carry into effect any law without their concurrence. All laws must be approved of by the secretary of state for the colonies before they can take effect. Any individual properly qualified may be appointed to the most responsible situation, without reference to service, nation, or religion, and native Singhalese have occupied some of the highest posts. The island is divided into nine provinces—the Eastern, Western, Northern, Southern, Central, North Central, Northwestern, Sabaragamuwa, and Uva, and subdivided into districts. In each province is stationed a government agent. For

CEYLON

the administration of justice there are in the civil and criminal departments a supreme court, established at Colombo; also a vice-admiralty court, and provincial courts, stationed in various districts; besides magistracies. There are municipalities or local boards in the towns, and there are also native village councils. The chief sources of revenue are the customs duties, railroad receipts, land rents, and salt farms. The chief articles of export are now free. The revenue for 1898 amounted to \$12,600,000; expenditure, \$11,400,000. The public debt amounts to about \$17,300,000; but the finances are in a very healthy condition, as the public debt of the colony has been mostly incurred for the construction of railroads.

People.—The present population of Ceylon is composed of Singhalese, Cingalese, or Ceylonese, descendants of immigrants from Hindustan who entered the country in the 6th century B.C., Malabars or Tamils, originally from southern India, Moors, Malays, Veddahs, and a small proportion of Europeans and their descendants. The Singhalese inhabiting the coasts are a mild, timid race, obsequious to strangers, and hospitable and humane. Their stature is rather below the middle size; their limbs slender, but well shaped; eyes dark, finely cut features, hair long, smooth, and black, turned up and fixed with a tortoise-shell comb on the top of the head; color varying from brown to black, or rather from the lightest to the darkest tints of bronze. The Singhalese of the interior, or Kandian Singhalese, are a superior race, being stouter, handsomer, and of more manly and independent bearing, with a greater degree of intelligence. The Malabars of Ceylon are similar in all respects to those of the continent. The Mohammedans or Moors are an energetic and industrious people, and engross a large proportion of the commerce and traffic of the island. The Veddahs, a savage race, are supposed to be a portion of the aboriginal inhabitants of Ceylon. They inhabit the most secluded and inaccessible parts of the island, and subsist entirely on wild fruits and animals. A cloth round the loins is their only clothing; and their habitations, generally of small dimensions, are formed for security among the branches of large forest trees. They are a robust and hardy race, but extremely peaceable and inoffensive. The other inhabitants of the coast consist of Dutch, Portuguese, and English; some Malays or natives of the Eastern Archipelago, a few Chinese and Parsee traders, and a various population sprung from the intermixture of these races with each other. The descendants of the Dutch and other Europeans are known as burghers. The population is rapidly increasing. In 1832 it scarcely amounted to 1,000,000; while in 1881 it was 2,750,000. In 1901 the total was 3,576,990, including 2,334,817 Singhalese, 952,237 Tamils, 224,719 Moormen, and 9,583 Europeans. The increase is partly to be attributed to the number of coolies who come from India for employment on the plantations.

Religion, Language, Education.—More than half the population are said to be Buddhists, and about 500,000 are of the Hindu religion. Buddhism chiefly prevails in the interior, and generally among the Singhalese of the sea-coasts. It is maintained and protected by the British government, agreeably to the treaty of 1815. On the western and southwestern coasts

numbers of the Singhalese profess the Roman Catholic religion. There are a number of Episcopal clergy in the island, subordinate to the bishop of Colombo; various other Protestant bodies have places of worship, but the Protestants are less than half the number of the Roman Catholics. The Singhalese have a colloquial language peculiar to themselves, but their classic and sacred writings are either in Pali or Sanskrit. The Malabars use the Tamil English is becoming more and more common, "and there is scarcely a roadside village in Ceylon now where the traveler could not find some persons to speak English, or interpret for him." The government has a department of public instruction, and good progress is being made in education throughout the island. On 1 Jan. 1891, there were 146,500 children participating in public instruction, a number of the schools being maintained or aided by the government. There are schools maintained also by the Church Missionary Society, by the Wesleyan, the American, and the Baptist Missionary societies, besides a number of private and some regimental schools.

Antiquities, History, etc.—The Singhalese annals contain a historical record of events for 24 centuries; and their authenticity, as regards description of ancient towns and buildings, and other works of art, is established by existing ruins, proving that the island had been, at a remote period, inhabited by a powerful and numerous people. The ancient capital, Anuradhapura, and its neighborhood contain many interesting and splendid relics of the ancient Singhalese civilization. Chosen as the capital in 437 B.C., it received fully a century later various relics of Guatama Buddha, and to contain these as well as other sacred articles many temples were erected. In the 1st century of our era the city occupied an area of 256 square miles, enclosed by 64 miles of walls. A remnant of the celebrated bo-tree, said to have sprung from that under which Gautama sat at the time when he became a Buddha, is still seen enclosed in the court of a temple. Here, too, is the so-called Brazen Palace, originally built in 142 B.C., and consisting of 40 rows of 40 pillars each. Dagobas, or shrines containing relics of Buddha, are very numerous. They are of brick, incrusting with a special preparation which takes on a fine white polish. One of the finest of these monuments is the Ruwanwelisaye, built about 140 B.C.; but the most beautiful of Ceylonese dagobas is the Toopharamaya, with many finely sculptured columns. Jaitawaramaya, originally 315 feet in height, is now 269 feet high, and, like most of the ruins of the island, is overgrown by trees and brush-wood. Among the most curious and notable of the ancient relics which invest Anuradhapura with such profound interest are the numerous tanks constructed at various dates between 200 B.C. and 300 A.D., and in the 12th century. Some of these are of enormous size, and several have been restored and applied to their original purpose of irrigation. From the 8th to the 13th century the capital was Pollanarrua, now Topare, near which also are found many splendid ruins, including a fine rock temple. At Dambula, there is a celebrated cave temple, dating from the 1st century B.C.

Ceylon was known to the Greeks as Taprobane. In 543 B.C. it was conquered by Vijaya, a prince from the mainland of India, and for

CEYLON MOSS — CHABLAIS

several centuries the island enjoyed great prosperity under the generally beneficent rule of his dynasty. The Hindu incomers brought with them the civilization of their own country, and great part of Ceylon became covered with towns and villages. Several of Vijaya's successors had to contend with invading Malabars, and these ultimately secured the sovereignty. A restoration of the line of Vijaya in the 11th and 12th centuries contributed to the return of something of the ancient grandeur of the island. Little was known regarding it in Europe until 1505, when the Portuguese established a regular intercourse with Ceylon, being encouraged thereto by a native king. The Portuguese were subsequently expelled by the Dutch in 1658, after a stubborn struggle of 20 years' duration. The Dutch soon opened up an extensive and profitable trade with Holland, and they constructed several canals to serve as means of communication between their various posts on the island. Their policy, however, though beneficial on the whole to the Singhalese as well as themselves, was essentially a selfish and exclusive one. British intercourse with the island began in 1763, and in 1795, owing to the war with France and Holland, Great Britain was induced to attempt an effective occupation of it. In that year Trincomalee, and in the following year Colombo, was captured; and by these victories all the Dutch forts were transferred to Great Britain. By the peace of Amiens (1802) the whole coast territory was formally ceded. The king of Kandy, who remained in possession of the central mountainous region, perpetrated such atrocities on his own people that many of their chiefs in 1815 entreated Great Britain to depose him. A short campaign was ended by the capture of the tyrant and his deportation as a prisoner to India, and since then the whole island has been under direct British rule. A serious rebellion in 1817 and minor ones in 1843 and 1848 have been the only breaks in the generally tranquil subsequent history of the colony. British rule has contributed very largely to the material advancement of the island by the construction of roads and railways, the extension of the Dutch canal system, the restoration of irrigation tanks, the bridging of rivers, and the development of its great natural resources. Two important events in its modern history have been the rise and decline of coffee-planting (say from 1837 onward, and the substitution of tea-planting (about 1878) in its place. The decline of coffee-planting, as is well known, has been caused by a leaf-fungus. The planting of cinchona, cacao, and rubber-trees has also helped to add to the resources of Ceylon in recent times. In 1901 a considerable number of Boers, captured in the South African war (q.v.), were sent to Ceylon.

The principal towns of the island are Colombo, Trincomalee, Kandy, Galle, Jaffna, and Kornegalle.

Ceylon Moss. See AGAR.

Chapu, cha-poo' or shā-poo', or **Chapoo**, China, a seaport town in the province of Cheh-Chiang (or Che-Kiang), on the north side of Hang-Chau Bay, 35 miles from Ning-Po. Although not a treaty port, it carries on a considerable commerce with Japan. Its European trade is conducted through the treaty port of Ning-Po, and is largely in green tea. Its im-

ports are ginseng (from the United States), and manufactured goods. The native industries are sedge hats and mats, fishing, and silk-making. Merchant vessels do not touch at Chapu ordinarily, although Chinese and Japanese junks put in regularly. Pop. about 80,000.

Chabaneau, Camille, kā-mēl shā-bā-nō, French philologist; b. Nonttron 4 March 1831. Since 1879 he has been professor of romance languages at Montpellier. He has written 'Histoire et Theorie de la conjugaison Française' (1868); 'Grammaire Limousine' (1876); 'La Langue et Littérature Provençales' (1879); 'Biographies des Troubadours' (1885); and has contributed largely to the 'Revue des Langues Romanes.'

Chabas, François, frān swā shā-bā, French Egyptologist; b. Briancourt 2 Jan. 1817; d. Versailles 17 May 1882. Though at first engaged in commerce, he found time to become a learned linguist, but it was not till 1851 that he gave himself up to the study of hieroglyphics. The first results of his studies appeared in 1856, followed by a series of invaluable books and papers, elucidative chiefly of two important periods of ancient Egyptian history—the conquest of the country by the Hyksos, and the time of their expulsion. Among the more important of his many books are 'The Shepherds in Egypt'; 'History of the 19th Dynasty and especially of the Period of the Exodus'; and 'Studies of Historical Antiquity from Egyptian Sources.' From 1873 to 1877 he edited 'L'Egyptologie.'

Chabazite, a member of the zeolite family of minerals of variable composition, but in general definable as a hydrated silicate of aluminum, calcium, and sodium, with small amounts of potassium, and occasionally of barium and strontium. It has a hardness of from 4 to 5, and a specific gravity of about 2.1. It is transparent or translucent, and varies in color from white to pale red or yellow. It occurs in rhombohedral crystals that are sometimes barely distinguishable from cubes, and also in amorphous forms. It is widely distributed, and usually occurs in connection with basalt, syenite, gneiss, or mica, or hornblende schist.

Chabert de Cogolin, Joseph Bernard, zhō-zēf bār-nār shā-bār dē kō-gō-lān, MARQUIS, French geographer; b. Toulon 28 Feb. 1724; d. 1 Dec. 1805. He entered the marines as a cadet in 1741. In 1750 he sailed to the North American coast, and on his return published the result of his observations in an astronomical and hydrographical work, entitled, 'Voyage sur les Côtes de l'Amérique Septentrionale' (1753). In 1758 he was chosen a member of the Academy. In the American war Chabert distinguished himself so highly that in 1781 he was made commander of a squadron. In 1792 he was made vice-admiral. During the same year the Revolution drove him to England. In 1800 he lost his sight in consequence of his intense application to study, and in 1802 returned to Paris, where Bonaparte assigned him a pension. In 1804 he was appointed a member of the Bureau des Longitudes, and in 1805 presented to it a map of Greece and a description of the coasts of that country.

Chablais, shā-blā, France, a district in Savoy, south of the Lake of Geneva. At one time it formed part of the kingdom of Bur-

gundy, but in the 11th century came into the possession of the counts of Savoy. In 1860 it was ceded to France, along with the rest of Savoy, by Victor Emmanuel, king of Sardinia. It now forms the *arrondissement* of Thonon (its ancient capital), in the department of Haute-Savoie.

Chablis, *shā blē*, France, a town in the department of Yonne, on the left bank of the Serein, 11 miles east of Auxerre. It stands in the midst of vineyards which produce the celebrated white wine known by its name. The annual product is about 4,400,000 gallons, but the quantity sold over the world as Chablis is much greater. Pop. 2,400.

Chabot, François, *fran-swā shā-bō*, French revolutionist: b. Saint Geniez, France, 1759; d. Paris 5 April 1794. In early life he entered the Capuchin order. The treatises of casuistry which he perused in order to prepare him for the confessional he claimed to have corrupted his morals, and on the suppression of the monasteries, though still professing to be a priest, he gave himself up to the most scandalous excesses. The Bishop of Blois nominated him his vicar-general, and succeeded in getting him chosen deputy to the national convention for the department of Loire-et-Cher. In this capacity he displayed the bitterest animosity against the king and his ministers, and all deputies friendly to moderate courses; and labored incessantly to overturn the throne. On the night of 10 Aug. 1792, he preached in a church of the Faubourg St. Antoine, and urged the most violent incitements to insurrection; though on the following day he is said to have saved some priests and the Abbé Sicard, the celebrated teacher of the deaf and dumb, from the fury of the populace. His party, from occupying the higher seats of the national convention, were designated by the name of the Mountain, which they have since retained. The conversion of the cathedral of Notre Dame into the Temple of Reason is said to have originated with Chabot. He at last became suspected by his party, chiefly in consequence of his marriage with a young and beautiful Austrian, and the favoritism he displayed toward his two brothers-in-law, who were striving to enrich themselves in the general disorder. Along with several other deputies he was accused of having appropriated the effects of the former East India Company, and vainly tried to save himself by reminding Robespierre of the services he had rendered him. When he saw that he was lost he swallowed poison, but suffered such excruciating pains that he took an antidote to remove them. Three days after he was guillotined. His brothers-in-law shared his fate.

Chabot, Philippe de, *fē-lēp dē*, French general: b. about 1480; d. 1 June 1543. Having bravely defended Marseilles in 1524, he was made prisoner at Pavia in 1525. Appointed admiral immediately after his release, he was sent to Italy in 1529 to negotiate the ratification of the treaty of Cambray by Charles V. Made commander-in-chief of the forces in Savoy in 1535, he effected the conquest of part of that country and of Piedmont, but was censured for not following up his victory. On his return to France charges of frauds upon the national treasury were

brought against him. Found guilty and imprisoned, he was soon afterward pardoned by the king at the urgent solicitation of the duchess d'Étampes, and reinstated in his position. He is said to have been the first to suggest the project of colonizing Canada.

Chabrias, *kā'brī-ās*, Athenian general. In 392 he succeeded Iphicrates in the command of the Athenian forces before Corinth, was afterward sent to chastise the Æginetes for depredations on the coast of Attica, and assisted Evagoras in Cyprus, and Acoris in Egypt, against the Persians. In 378 he commanded the army which the Athenians sent to the aid of Thebes against the Lacedæmonians, under Agesilaus, on which occasion he saved his troops from impending defeat by a military manoeuvre renowned in antiquity, commanding them to await the attack of the enemy with pointed spear and shield, resting on one knee. In 376 he won an important victory over the Lacedæmonian fleet off Naxos. The Athenians having abandoned the alliance of Thebes, he defended Corinth against Epaminondas. He took part in the expedition against Thrace at the outbreak of the so-called social war. At the siege of Chios his vessel was the first to enter the harbor, but becoming isolated and disabled was soon abandoned; he alone refused to save his life, and fell fighting, 357 B.C. He was the last of the great Athenian generals. Demosthenes said of him that he conquered 17 cities, took 70 vessels, made 3,000 prisoners, and enriched the treasury of Athens with 110 talents. One of his apothegms, for which he was celebrated, was that an army of stags led by a lion is superior to an army of lions led by a stag. His life was written by C. Nepos.

Chabrier, *sha-brē-ā*, **Alexis Emmanuel**, French composer: b. Ambert, France, 18 Jan. 1841; d. Paris 13 Sept. 1894. He at first studied law, but presently turned his attention to music. He composed the operas of 'Gwendoline' (1886); and 'Le Roi Malgre Lui' (1887). Other works by him are 'Dix Pieces Pittoresques'; and 'España,' an orchestral rhapsody.

Chac-Mool, *shāk-mool'*, according to tradition, a chief of the Maya Indians of Yucatan. In 1876 a statue was discovered in the ruins Chichen-Itza, Yucatan, to which Le Plongeon gave the name of Chac-Mool, because he supposed it to be a representation of the chief. The statue was taken by the Mexican government and placed in the National Museum of Mexico, but the correctness of Le Plongeon's identification is in question among archaeologists.

Chacabuco, *chā-cā-boo'kō*, Chile, a mountain and mountain pass, 28 miles north of Santiago, in the province of that name. It is celebrated as the scene of a decisive victory of the republicans over the royalist troops on 12 Feb. 1817.

Chacma, *chāk'ma*, the Hottentot name for the baboon (*cynoccephalus porcarius*) native to western Africa. It is grayish-black in color, and has a well-marked crest of hair along the neck. It is larger than the allied species of its native region. See BABOON.

CHACO — CHADWICK

Chaco, chă'kō, South America, the name formerly given to a region of vast size in the central part of the continent, on the left bank of the Paraguay River, and the right bank of the Paraná, and extending below the confluence of those rivers, from about 20° to or beyond 28° south latitude. For years it was claimed by both Paraguay and Argentina, but effectively occupied by neither. The southern portion, below the Pilcomayo River, now belongs to Argentina, and has been divided into the territories of El Chaco and Formosa. The northern and larger portion, from the Pilcomayo River to Bolivia, belongs to Paraguay, and is called El Gran Chaco, or Paraguay Occidental. See CHACO, EL; CHACO, EL GRAN.

Chaco, El, a territory ("territorial government") of Argentina, bounded on the north by the territory of Formosa, on the east by Paraguay and the province of Corrientes, on the south by the province of Santa Fé, and on the west by the provinces of Salta and Santiago del Estero. Its area is 62,000 square miles, and its population about 30,000. Its capital is Resistencia, on the right bank of the Paraná River, with a population of 3,000. The districts near the river are inhabited by civilized people, who cultivate the soil or exploit the forests, while Indians roam in the interior. The national government has encouraged immigration by selling land to settlers at the average price of 31 cents for an acre.

Chaco, El Gran, the western section of the republic of Paraguay. It is also called Paraguay Occidental or El Chaco Paraguayo. It extends northward and westward from the right bank of the Paraguay River to the frontiers of Bolivia; Brazil bounds it on the northeast; Argentina on the southwest. By a convention concluded 3 Feb. 1876, between Paraguay and the Argentine Republic, the territory between the Pilcomayo and Bermejo rivers was surrendered to Argentina, but the part of Chaco which extends from Bolivia to the Rio Verde was acknowledged to belong to Paraguay. The other section of Chaco, which lies between the Rio Verde and the Pilcomayo, was subsequently awarded to Paraguay by the arbitrator chosen by both governments, R. B. Hayes, President of the United States (12 Nov. 1878). The commemoration of this event, and as a compliment to the arbitrator, the name of the principal town of Gran Chaco, was changed from Villa Occidental to Villa Hayes, by which name it is now known. The interior of Gran Chaco is almost entirely in the possession of nomadic tribes of Indians, some of them hostile to white men. Save Villa Hayes, Bahía Negra, and Fuerte Olimpo, there were, until quite recently, no settlements within its limits. It was regarded as a comparatively worthless, swampy, uninhabitable region. But surveys disclosed large tracts of land as desirable as any in that part of the world can be—exceedingly fertile, suitable for agricultural and grazing purposes, and in part covered with forests of valuable hard woods. The sales of such lands have greatly increased the receipts of the Paraguayan treasury. Stock-raising has become a profitable industry along the banks of the Paraguay River and for a distance of 30 miles inland. Special interest attaches to the

plan for improving navigation on the Pilcomayo River, and thus furnishing a direct outlet for the natural products and manufactures of pent-up Bolivia, via the Paraguay and Paraná rivers to Buenos Ayres and Montevideo. The area of Gran Chaco is approximately 91,499 square miles, somewhat less than one half of the total area of Paraguay.

Chacornac, Jean, zhôn shă-kôr-nâk, French astronomer: b. Lyons 21 June 1823; d. Paris 20 Sept. 1873. He is principally known for his discoveries of asteroids, which came about in connection with his work on the formation of ecliptic charts of the stars, and for the charts just mentioned. His asteroid discoveries were six in number, and most of his work was done at the Paris Observatory under Leverrier.

Chad, chăd. See TCHAD.

Chad'band, Rev. Mr., a personage in Dickens' 'Bleak House.' He is a hypocritical minister, who pretends to be humble and to despise the world, but is in reality extremely selfish and self-indulgent.

Chadbourne, chăd'bêrn, Paul Ansel, American educator and writer: b. North Berwick, Maine, 21 Oct. 1823; d. New York 23 Feb. 1883. He was president of the Massachusetts Agricultural College at Amherst (1867-82); of the University of Wisconsin (1867-70); of Williams College (1872-81). He wrote: 'Natural Theology' (1867); 'Instinct in Animals and Men' (1872).

Chadd's Ford. See BRANDYWINE CREEK.

Chad'wick, French Ensor, American naval officer: b. Morgantown, W. Va., 29 Feb. 1844. He graduated at the United States Naval Academy in 1866, and became a captain in 1897. During the war with Spain he commanded the armored cruiser New York, the flagship of the North Atlantic squadron, and was chief-of-staff to Admiral Sampson. In October, 1900, he was appointed president of the Naval War College.

Chadwick, George Whitfield, American musician: b. Lowell, Mass., 13 Nov. 1854. He was graduated at the Leipsic Conservatory, and in 1897 became director of the New England Conservatory of Music. He has won distinction as a composer with 'Tabasco,' a comic opera; 'Jubilee,' a symphony; and 'Columbian Ode,' a chorus. Since 1897 he has conducted the annual music festival at Worcester, Mass.

Chadwick, James Read, American physician: b. Boston, Mass., 2 Nov. 1844. He graduated B.A. at Harvard 1865; M.D. 1871; and pursued further studies abroad. In 1873 he began practice in Boston, and has become distinguished as a gynecologist. He was a founder of the American Gynecological Society, its secretary 1876-82, and president 1897. A strong advocate of cremation, he has been president of the Massachusetts Cremation Society since 1894. He has contributed many important articles on his specialty to the 'Transactions' of the American Gynecological Association, the Boston 'Medical and Surgical Journal,' the 'American Journal of Obstetrics,' etc.

Chadwick, John White, American writer and Unitarian clergyman: b. Marblehead, Mass., 19 Oct. 1840. His radical sermons have

MAJOR-GENERAL ADNA R. CHAFFEE.

attracted attention, and he has been a liberal contributor to current literature. Since 1864 he has been pastor of the Second Unitarian Church in Brooklyn, N. Y. Among his works are: 'A Book of Poems,' (1875); 'The Bible of To-day' (1878); 'Origin and Destiny' (1883); 'A Daring Faith' (1885); 'The Man Jesus'; 'The Faith of Reason'; 'Old and New Unitarian Belief'; 'The Power of an Endless Life'; 'The Revolution of God'; 'Theodore Parker, Preacher and Reformer' (1900); 'George William Curtis.'

Chæroneia, kër-ō-nē'a, a town in Bœotia, famous as the scene of several celebrated battles of antiquity. An important battle was fought near it in 447 B.C., by which the Athenians lost the supremacy in Bœotia. A still more celebrated battle was fought 338 B.C., in which Philip of Macedonia defeated the united forces of the Athenians and Bœotians, and crushed the liberties of Greece. A colossal sculptured lion was obtained by excavation on the site of this battle. In a third battle, fought at Chæroneia, Sulla defeated the generals of Mithridates, 86 B.C.

Chætopoda, kē-tōp'ō-dā, an order or subclass of the class *Annelida*, recognized by the bristles (chætæ), usually four bundles to a segment. They comprise the earthworm (q.v.), certain fresh-water and numerous annelids which live in the sea, such as species of *Serpula*, as *S. arenicola*, the lob-worm (q.v.), and many other genera; the most common and one of the largest American chætopods is the "clam-worm," (*Nereis virens*), which is associated with the clam of the New England coast, burrowing deeply in the mud. The marine forms undergo a metamorphosis, hatching as a top-shaped, free-swimming larva, called a trochosphere (q.v.). Some of the forms, as *Nais*, *Syllis*, *Autolytus*, etc., also multiply by a process of self-division called strobilation, and by alternation of generations. Some of them, as *Serpula* and *Spirorbis*, live in solid calcareous tubes or shells. Certain forms are luminous. The tracks of chætopod worms occur in Cambrian strata, which are so much like those made by existing forms as to show that the type has undergone little change since the Cambrian Period, which lies at the very base of the Palæozoic Age.

Chafer, chā'fēr, the British name for a scarabæid or dung-beetle (q.v.). The larger ones, called cockchafers, are very destructive to vegetation, especially in the larval state.

Chaf'fee, Adna Romanza, American military officer: b. Orwell, Ohio, 14 April 1842. He received a public-school education; entered the regular army as a private, 22 July 1861; became a captain, 12 Oct. 1867; and colonel of the 8th U. S. Cavalry, 8 May 1899. On 4 May 1898, he was commissioned brigadier-general of volunteers for the war with Spain; on 8 July, following was promoted to major-general; and on 13 April 1899, was honorably discharged under this commission. On the last-mentioned date he was re-appointed a brigadier-general of volunteers, and on 19 July 1900, the President, having selected him to command the American military forces in China, commissioned him a major-general of volunteers. He reached Taku, China, on 28 July, and led the American con-

tingent of the allied force which entered Peking on 15 August, and rescued the foreign legationers. Gen. Chaffee made a brilliant record in the Apache Indian campaigns; commanded the troops which captured El Caney, in Cuba; and afterward was chief of staff to both Gens. Brooke and Wood, when governor-general of Cuba. He has been widely known as a dashing cavalry officer, and his selection to command the American troops in China gave high satisfaction to his brother officers. On 19 June 1901, Gen. Chaffee was appointed military governor of the Philippines, to succeed Gen. MacArthur. He was relieved of this command in the autumn of 1902 and ordered to the command of the East. In 1904 he was chief of staff with the rank of lieutenant-general.

Chaf'finch, a brilliantly colored and well-known European finch, one of the most popular and most valuable cage-birds (q.v.). It is found in large numbers throughout the continent and England, and is migratory in the more northern parts, remaining, however, in England and around the Mediterranean in winter, where it is shot in great numbers for market purposes. The top of the head and nape of the neck of the male are bluish-gray, the back is chestnut, and the black wings are streaked with two conspicuous white bars. It is sought not only because of its loud, clear, and pliable voice, but because of its docility and beauty. Its voice is susceptible to training, and its value greatly increases by cultivation, the wild bird having an unpleasant and almost harsh cry. These birds sometimes have a repertoire of as many as six tunes, the words of which they sing with almost human articulation. Their training and rearing from the nest is an important industry throughout Europe, and particularly in Germany. For a full account of the powers of song of the chaffinch see Bechstein's 'Cage-Birds.'

Chagos (chā'gōs) **Archipel'ago**, a group of islands in the Indian Ocean, nearly on the same meridian as the Laccadives and Maldives, and probably a continuation of them. It extends from lat. 7° 39' to 4° 44' S., and lon. 70° 50' to 72° 50' E. The largest, called Diego Garcia or Great Chagos, 100 miles south of the main group, is about 12½ miles long by six broad, is of a crescent shape, and consists of a coral atoll covered with cocoa palms, and enclosing a lagoon which forms a harbor four miles broad. Fish abound, and excellent green turtle may be found on the shores. The islands belong to Great Britain, and form a dependency of Mauritius. Coconut oil is the chief product. Pigs and poultry are raised in abundance. Pop. 750.

Chagres, chā'grēs, Colombia, a seaport on the north coast of the Isthmus of Panama, at the mouth of a river of the same name. It acquired some importance at one time as the station at which steamers landed the mails for the west coast of America, and has been frequently associated with the proposed communications between the Atlantic and the Pacific. The terminus of the railroad across the isthmus was, however, fixed at Aspinwall, about eight miles northeast, and Chagres then greatly declined. The projected Panama canal route is partly in the bed of the Chagres River.

CHAILLE—CHAIN-MAKING

Chaille', shā-yā, Stanford Emerson, American physician: b. Natchez, Miss., 9 July 1830. He graduated B.A. at Harvard in 1851, and M.D. at Tulane University in 1853, subsequently studying in Europe for three years. During 1862-3 he was medical inspector of the Confederate army in Tennessee, and later had charge of various military hospitals. He is a member of the National Board of Health, and in 1879 was president of the Havana yellow-fever commission. Since 1858 he has held various professorships in Tulane University, Louisiana, and since 1886 has been dean of the medical department, and professor of physiology, hygiene, and pathological anatomy. He is a member of numerous medical societies and boards of health, and has contributed many articles to their journals and periodicals. In addition, he has published: 'Yellow Fever in Havana and Cuba'; 'Origin and Progress of Medical Jurisprudence, 1776-1876' (1877); 'Laws of Population and Voters' (1872); 'Living, Dying, Registering, and Voting Population of Louisiana, 1868, 1874, 1875'; 'Intimidation of Voters in Louisiana' (1876). From 1857 to 1868 he was co-editor and proprietor of the New Orleans 'Medical and Surgical Journal.'

Chaille-Long, shā-yā-lôn, Charles, American explorer: b. of French parentage, Baltimore, Md., 1843. After serving in the Confederate army he went to Egypt, where he was appointed lieutenant-colonel by the khedive (1870). Gordon made him chief of staff and sent him on a mission to King Mtesa of Uganda. He has written: 'The Three Prophets' (1886); 'Central Africa' (1887); etc.

Chaillot, shā-yō, France, formerly a village on the right bank of the Seine. It boasts a considerable antiquity, being noticed in a map of the 11th century. In 1659 it became a suburb of Paris, and received the name of Faubourg de la Conférence, in memory of the conference at which the Peace of the Pyrenees was concluded. In 1786, when a wall of inclosure was built around Paris, it was included within it, and has since formed part of the western district of Paris, near the Champs Elysées.

Chaillu, Paul du. See DU CHAILLU.

Chain, in surveying, is a measure consisting of 100 links, equal to 4 rods, or 66 feet, used for measuring land. It is sometimes called Gunter's chain, from its inventor.

Chain-bridge. See BRIDGE.

Chain-cable. See CABLE.

Chain-making. Iron and not steel is still the favorite material from which chains are manufactured. Chain cable is employed in quarrying, for lifting heavy weights in building construction, in foundries and machine shops, or at the docks in loading and unloading vessels; while to the lumberman it is absolutely indispensable. In such work the strains are severe and sudden, the links of the chain being subjected to repeated jar and wrench due to the slipping or dropping of the material which is being hauled and lifted. It is also found performing the most important and delicate work of hauling a yacht or merchant vessel up a marine railway; while last, and most important of all, is its use as a ship's cable, where, in

times of stress, a vessel costing hundreds of thousands of dollars, together with priceless human lives, may depend upon the sound quality of the material and the fidelity with which the smith has welded the chain, link by link, on his anvil.

Quality of Iron for Chain Making.—The iron used is a specially rolled grade, of high tensile strength and great ductility, the object being to secure a chain which, on the application of a sudden stress—as, for instance, when a ship is riding at anchor in a heavy seaway—will stretch and so resist the strain gradually, instead of snapping, as would be liable to happen with material of higher tensile strength but small ductility or power of elongation. Chain of from 5-16 inch up to 2 inches diameter is forged by hand, and above 2 inches it is forged with the assistance of machinery.

Hand-made Chain.—In the smaller sizes the whole operation of chain-making is done by a single smith without any helper. The length of completed chain is hung upon a hook or some convenient support near the anvil, and the operation of forging the link proceeds as follows: In his fire the smith will have two or three short rods of the required diameter, and as one is heated to, say, a cherry red, he withdraws it, cuts off the desired length for one link, gives it a couple of blows to form the welding scarf, bends it through, say, about 130 degrees, hooks it into the end of the completed chain, and brings the ends together for welding. He then raises the link to a welding heat in his fire, places the abutting ends over what is known as the bick-iron, gives it a few taps to insure a good weld, brings over a "dolly" (which is hinged at the outer end of his anvil and when brought over registers above the bick-iron), and with half a dozen blows on the dolly, accompanied with a dexterous movement of the link, the weld is completed and the link smoothed up to a neat finish. The rapidity with which the smiths do this work is very remarkable. Thus, in the case of a 7-16-inch chain, with 30 links to the yard, an expert smith will cut off from the iron bar, scarf, bend up into shape, and weld the links, at the rate of 18 yards in a day of nine working hours, which is two yards per hour, or one link per minute. In forging 1¼-inch chain the smith uses two helpers, and the iron is cut to about one-foot lengths, and several of these are being heated in the fire at the same time. The operation is as follows, the various steps succeeding each other with great rapidity: First, the helper to the right of the anvil withdraws the heated piece, drops one end into an eye at the end of the anvil, and bearing down upon the tongs, bends the piece over to an angle of about 45 degrees. The smith then takes it in his tongs, and with a few taps of the sledge it is bent around. It is heated again, passed through the end of the chain by the smith, laid flat on the anvil and the welding scarfs are put on with a few blows of the sledge. The link is now raised to a welding heat, welded by a few blows by the helpers, laid over the bick-iron, the hinged dolly is brought over, and a few rapid blows on the dolly, while the smith turns the link to and fro, serve to bring the weld up to a smooth finish. The link is now laid on edge; a single blow from the sledge brings it into shape, and with a final tap or two of the smith's hammer the link is finished. At this forge as

CHAIN MAKING.

Inserting the Stud in Heavy Stud Chain.

Bringing Scarfed Ends of Link Together Ready for Welding.

CHAIN-SHOT — CHALCEDON

many as 35 links will be added to a heavy chain of this size in one hour, or say about one every two minutes.

Machine-made Chain.—In the heavier sizes of chain of over 2 inches diameter, it becomes necessary to call in the aid of machinery in shearing the iron into lengths for the links and in bending the links into shape. The scarfs are produced by shearing the iron at an angle of 60 degrees with the axis of the bar, all cuts being taken with the inclination in the same direction, so that when the links are formed up the scarfs will lap in the desired relative position. The iron is then heated and placed in a hydraulic bending machine, where it is formed against a block into a rough U-shape at the first stroke, and then rolled into the oval link form on another block adjoining the first. The scarfed ends are left wide enough apart to allow of the link being hooked onto the end of the chain which is being forged. The scarfed ends are now brought down snugly into contact under an automatic quick-acting hammer, and the link is heated and then welded up under the same hammer. Most of the ship cable has a cast-iron stud inserted in each link. The ends of the stud are hollow, to match the round of the chain, and when the link has been hammered down snugly into place, it is impossible for the stud to be displaced. Indeed, the pull upon the cable, by tending to straighten it out, causes the link to tighten upon the stud and hold it the more securely in place. Cables are made in standard lengths of 15 fathoms or 90 feet, and any greater length is obtained by shackling several of the 15-fathom lengths together, the average length of a ship's cable being about 90 fathoms, or 540 feet. The life of such a cable is about 10 years.

Blacking.—When the 15-fathom length is completed, it is placed in an iron box and heated by steam, and then drawn through a vat of boiling tar, known as the "tar kettle." Here it receives a thorough coating, after which it is drawn out upon an iron grating, where the surplus tar is allowed to drain off, leaving a heavy protective coat upon the cable. In conclusion it should be noted that although each link of a chain consists of two thicknesses of bar, it must not be presumed that a chain possesses double the strength of a single bar; actually there is a reduction of three tenths in the strength, due to the formation into links, so that the chain has but about seven tenths of the united strength of two bars of the same diameter of iron. Moreover, as the strength per square inch of a heavy bar is not so great as that of a smaller diameter iron, there is further reduction to be made on this account. Thus, if a bar of ordinary rolled iron shows a breaking strength of 20 tons per square inch, the breaking strength will decrease to 19 tons up to 2 inches, and 18 tons per inch up to 3 inches diameter of rod. Consequently the breaking strength of chain made of 1-inch iron will be about 50,000 pounds, and the breaking strength of 2-inch chain about 190,000 pounds.

Chain-shot, a projectile consisting of two balls connected by a bar or a chain, formerly used for cutting and destroying the spars and rigging of an enemy's ship. It was invented by Admiral De Witt in 1666, but has long been disused.

Chain-snake, a harmless terrestrial snake, ranging from the Great Lakes to Mexico. In length it is from four to five feet, the color varying with the species. In the East and South the typical form (*Ophiobolus getulus*) is glossy black, with a chainlike pattern of yellow lines covering its back; the belly is dirty yellow, blotched with black, and the head-plates are black, spotted with yellow. A larger variety, found west of the Mississippi, is "cream-colored, sharply marked with rings of black." Chain-snakes feed upon small mammals, amphibians and reptiles, including venomous serpents.

Chain-timber, a timber of large dimensions placed in the middle of a building to give it strength. Called also bond-timber.

Chaine, George, American clergyman: b. England 1851. At first a Methodist minister, he resigned in 1877, and for the next three years was pastor of the Unitarian church in Evansville, Ind. Since then he has been chiefly engaged in lecturing and writing upon theological subjects and mysticisms, traveling through Australia and Palestine on his lecture tours. He is editor of 'The Interpreter'; and conducts a "school of interpretation." Publications: 'Foundation Stones'; 'Unitarian Sermons' (1879); 'The New Version: Discourses on the Bible' (1882); 'She: An Allegory of the Church' (1889); 'Jeanne D'Arc' (1888); 'The Ten Commandments' (1900).

Chair, an article of domestic furniture, having legs, a back, and sometimes arms; usually for the accommodation of one person. A sociable or vis-à-vis, sometimes considered as a chair, has seats for two. Among the Romans the word sella was used generically for seats of various kinds, and had usually a qualificative term appended to it, as sella curulis, sella balnearis. They had also specific names for different kinds of seats; a seat with a back, like our chairs, was called cathedra. Chairs were much less common, both with the ancients and in the Middle Ages, than they are in modern times; hence, perhaps, the reason why chair and cathedra have both given their names in an allegorical sense to various dignities. We speak of the chair of justice, and the chairman of a meeting, and cathedra is now most widely known by its derivative cathedral, the name still given to a metropolitan church.

Chair of St. Peter, The, a relic at Rome of which the first known mention was made by Ennodius in 500, and a feast in honor of which was instituted or restored by Paul IV. in 1558. It was exposed for public veneration by Pius IX. in 1867. It is of wood overlaid with ivory and gold.

Chaise, shāz, a two-wheeled carriage for two persons, with a calash top, and usually drawn by one horse.

Chalcedon, kāl-sē'dōn, a city of ancient Bithynia, opposite Byzantium, at the entrance of the Euxine, about two miles south of the present site of Scutari. Chalcedon is said to have been founded before Byzantium, and was a flourishing town when it came into possession of the Romans, under the testament of Nicomedes 74 B.C., as included in the kingdom of Bithynia. It was finally destroyed by the Turks, by whom it was taken about 1075. At

CHALCEDONY — CHALCONDYLAS

Chalcedon in 451, Marcian, the emperor of the East, held the fourth general council for the purpose of destroying the ascendancy of the Monophysite doctrines obtained in 449 by the influence of the Alexandrian patriarch Dioscurus at the (so-called) robber-synod at Ephesus; and define the Christian faith so as to guard its orthodoxy against the Nestorian and Monophysite heresies. This council, which consisted of 600 bishops, mostly of the East, deposed Dioscurus, and after violent debates the articles of faith settled by them declared, in opposition to the Monophysites, the belief of two natures in Christ, existing without mixture or change, without division or separation, so that by the union of the two natures in one person and substance their distinction is not destroyed, but the characteristics of each are retained. Besides this creed the council promulgated 30 canons against clerical abuses, of which canons the twenty-eighth conceded to the see of Constantinople second rights and privileges to the Roman, but Pope Leo I. refused to confirm it. Rebellions in Palestine and Egypt were the immediate consequences of the decrees of the council of Chalcedon against Dioscurus and the Monophysites; and not till after a long period of ecclesiastical contests, during which the Monophysites were entirely separated from the orthodox and formed a distinct church, did the Chalcedon formula of faith obtain the undisputed authority which it now has in the Catholic, Greek, and many Protestant churches.

Chalcedony, käl-sěd'-ō-nī (from Chalcedon, an ancient Greek town in Asia Minor), a cryptocrystalline variety of quartz, transparent or translucent with a waxy lustre, and white, gray, blue, brown, or black in color, but commonly of a tint suggestive of diluted milk. It occurs in masses, also very frequently in mammillary, botryoidal and stalactitic forms. It is used for ornament and is often called "white agate."

Chalced'onyx, the name applied to those agates in which opaque white chalcedony alternates with the translucent gray variety.

Chalchihuitl', chāl-chī-wēt'l', a bluish-green mineral, highly prized by the ancient Mexicans, and identified with jadeite by some authorities, with emerald by others, and with the turquoise of the Santa Fé region by still others. The last-mentioned conjecture is probably correct.

Chalcis, käl'sis, a town of Greece, in the island of Negropont or Eubœa, separated by the narrow Strait of Euripus from the mainland, with which it is connected by a bridge that opens to let vessels through. The modern town is now one of the most attractive in Greece, and consists of an inner walled town and an outer or suburban portion, the walls being the work of the Venetians. In the inner town the streets are narrow and the houses lofty. Several of the churches were formerly mosques. Ancient Chalcis was one of the greatest of the Ionic cities, carried on a large trade, and planted numerous colonies. It had also colonies on the coasts of Macedonia and Italy, in Sicily, and in the islands of the Ægean Sea. The Chalcians joined the Boeotians in a war with Athens, in which they were defeated 506 B.C. After the Persian wars Chalcis became tributary to Athens. The Chalcians revolted 445 B.C., along

with the Eubœans, but were vanquished by Pericles. Another revolt occurred 411 B.C., and Chalcis for a short time became independent. A bridge was at this time built across the Euripus, and fortified; a passage sufficient for a single ship being left in the middle. It was subsequently occupied by the Macedonians, and after various vicissitudes fell under the yoke of the Romans. Chalcis joined the Achæans in their last war with Rome, when the city was taken and destroyed by Mummius. It was afterward rebuilt, and about the beginning of the Christian era was the chief city of Eubœa. It was held by the Venetians from 1210 to 1470, when it was taken by the Turks. Pop. about 10,000.

Chalcis (käl'sis) **Flies**, a family (*Chalcididæ*) of parasitic *Hymenoptera*, allied to the ichneumon flies, and with similar habits. The fore wings are nearly veinless; the posterior margin of the prothorax not reaching the tegulæ; while the ovipositor issues from before the end of the abdomen. The chalcids are generally minute, a few almost microscopic; many of them of beautiful shades of green, with metallic reflections. A goodly proportion of them are secondary parasites, that is, are parasitic on other chalcids; some deposit their eggs in galls. Typical genera are *Pteromalus* (*P. puparum*), *Semotellus*, and *Chalcis*. *Eurytoma hordci* is the wheat joint-worm, not being carnivorous or parasitic in other insects. Our largest chalcid is *Leucospis affinis*. Aside from the immense benefit these chalcid flies confer on agriculture by destroying noxious caterpillars, etc., the fig insect (*Blastophaga grossorum*) is the agent in enhancing the value and flavor of figs. See CAPRIFICATION.

Chalcocite, käl'-kō-sit (χαλκός, "copper"), a native sulphide of copper having the formula Cu₂S. It crystallizes in the orthorhombic system, and also occurs in massive and granular forms. It has a hardness of from 2.5 to 3, and a specific gravity of from 5.5 to 5.8. It is opaque and leaden in color, with a metallic lustre. In the United States it occurs in crystals at Bristol, Conn., massive as the principal copper ore at Butte, Montana, and similarly in many copper mines in Arizona; also in Mexico, Chile, and Peru. Beautiful crystals come from Cornwall, England, and one crystal, found in Tuscany, weighs half a pound. It contains 80 per cent of copper and is known also as "copper-glance," "chalcosin," and "redruthite."

Chalcondylas, käl-kön'dī-lās, **Deme'trius**, Greek grammarian: b. Athens about 1424; d. Milan 1511. He was a pupil of Theodore Gaza, and on the taking of Constantinople by the Turks came to Italy, where he taught the Greek language, was invited to Florence by Lorenzo di Medici about 1479, and proceeded afterward on the invitation of Ludovico Sforza, to Milan. He spread the study of the Greek language and literature in the west of Europe, and sent out several celebrated scholars. Among the works edited by him was 'Homer' (1488); 'Isocrates' (1493); and 'Suidas' (1499). He also compiled a Greek grammar, which was long in general use as a school-book. In his editions of the Greek authors he was somewhat arbitrary in his emendations of the text. His brother Laonicus, after witnessing the fall of Constantinople, followed his brother to Italy. He is the author of

a history of the last years of the Byzantine empire, from 1297 to 1462.

Chalcondylas, Laon'icus, Greek historian: b. Athens; d. about 1464. He was a brother of Demetrius Chalcondylas (q.v.). He was an ambassador of John VII. during the siege of Constantinople, and wrote a 'History of the Byzantine Empire 1297-1462.'

Chalcopyrite, käl-kō-pī'rīt (Gr. χαλκός "copper" pyrites), a native sulphide of copper and iron, having the formula $Cu_2S.Fe_2S_3$, and crystallizing in the tetragonal system, commonly with a tetrahedral aspect. Chalcopyrite is brass-like in appearance, and is often tarnished and iridescent. It has a specific gravity of about 4.2, and a hardness of from 3.5 to 4. It is widely distributed, and in Cornwall, England, it constitutes the chief ore of copper. It occurs in many parts of the United States also. Owing to the iridescence noted above, it is often called "peacock ore." It is softer and deeper in color than ordinary iron pyrites, with which it is sometimes confused.

Chaldæa, käl-dē'a, in ancient geography, the southerly part of Babylonia, toward Arabia and the Persian Gulf, lying west of the mouth of the Tigris and Euphrates. The Chaldæans are supposed to have been at first a wandering and predatory race like the Arabs, who afterward became settled, and ultimately gave their name to Babylon and the Babylonian empire. The name Chaldæan was especially applied to a portion of the Babylonian Magi, who were devoted to the pursuit of astronomy and magical science.

Chaldæan (käl-dē'an) Christians, a branch of the Nestorians, in communion with the Roman Catholic Church.

Chaldean MS., *The*, an extraordinary satire, now almost forgotten save by special students of literature. It was a skit at the expense of the publisher Constable, and of the Edinburgh notables specially interested in the Whig 'Edinburgh Review'; prepared by the editors for the seventh number of the new Tory 'Blackwood's Magazine,' October 1817. In form it was a biblical narrative in four chapters, attacking Constable, and describing many of the Constable clientage with more or less felicitous phrases. Many of its characterizations cannot now be identified, but they were all scathing and many of them mean. The joke was perpetrated by James Hogg, the "Ettrick Shepherd," whose original paper was greatly enlarged and modified by Wilson ("Christopher North") and Lockhart. The satire, which now seems so harmless, shook the old city to its foundations, and led to many lawsuits. Originally it was headed 'Translation from an Ancient Chaldee Manuscript,' and pretended to be derived by an eminent Orientalist from an original preserved in the great library of Paris.

Chaldee (käl'dē) Language, a form or dialect of the Aramean, one of the three principal varieties of the ancient Semitic. The region called in Scripture Aram may be described generally as occupying the northern and northeastern divisions of that corner of Asia which was the home of the Semitic languages. It was bounded on the north by the Taurus range and the river Tigris, which latter also formed its eastern boundary; on the west by the Mediter-

anean and Mount Lebanon; and on the south by Palestine and the Arabian desert. The Aramean language was very extensively known, not only within the limits above mentioned, but beyond them. The princes of Judea and Assyria were familiar with it; it was spoken in the palace of Nebuchadnezzar, and even formed the medium of communication between the Persian court and its subjects in Judea and Samaria. It may also lay claim to a high antiquity, being probably the language of Abraham previous to his migration into Palestine, and certainly of his grand-nephew Laban. Unfortunately the older monuments of the language have perished, the Chaldee portions of Daniel and Ezra being the earliest specimens we possess of a language which had probably existed and flourished at least 2,000 years before. There is another dialect of the Aramean besides the Chaldee, namely, the Syriac, and in this as well as in the Chaldee numerous writings are still extant, but they are all of comparatively recent date. The Chaldee literature is usually arranged in two divisions: the biblical Chaldee, or those portions of the Old Testament which are written in Chaldee, namely, Daniel from ii. 4 to vii. 28; Ezra iv. 8 to vi. 18, and vii. 12-26; and Jeremiah x. 11; and the Chaldee of the Targums and other later Jewish writings. The former is distinguished by a closer approach to the Hebrew idiom, and is therefore considered less pure than the Chaldee of the Targum of Onkelos, the oldest and most valuable of the Targums.

Chalder, chal'dër, an obsolete Scotch dry measure containing 16 bolls or 12 imperial quarters.

Chal'dron, an English measure of 36 bushels, used chiefly in measuring coal.

Châlet, shā-lā' ("a little castle"), the wooden hut of the Swiss mountain herdsman; a French-Swiss name, which is also extended to Swiss houses generally, as well as to ornate and picturesque villas built in similar style.

Chaleur Bay, sha-lër, or **Bay of Chaleurs**, an inlet or arm of the sea in the Gulf of St. Lawrence, between Quebec and New Brunswick. The French fleet was here defeated by the British in 1760. There are a number of islands in this bay, notably Shippegan, near its mouth. The navigation is good and the mackerel fishery is important.

Chalice, chāl'is (Latin, *calix*), a cup or bowl. This term, originally signifying a common drinking vessel, is now usually applied to a communion cup. From wood or other cheap material in early times, chalices came to be made of glass, agate, silver, and gold, with engraving, enamel, and different kinds of costly decoration. Some of them have great historic interest and value, and are preserved in church treasures and various museums of Europe. It is generally held that a chalice must have a knop or ball in the middle of the stem or foot which supports the bowl. This is intended to secure the hold of the person who hands it to the communicant. It has also a cover which may be the paten or dish for the consecrated bread. When the Protestant separation took place in England, the communion-cup was made of a wholly different pattern from the chalice.

Chalicotherium, käl'i - kō - thē'rī - ūm, or **Macrotherium**, māk-rō-thē'rī-ūm, an extinct

CHALK — CHALLENGE

ungulate of the Miocene Epoch, as large as a rhinoceros, but hornless and with enormous claws on the toes of both fore and hind feet,—a character almost unique among the *Ungulata*. The animal was distantly related to the *Titanotherium* (q.v.), but is usually placed in a distinct sub-order, the *Ancylopoda*. The foot-bones, when first found, were supposed to belong to an animal related to the *Edentata* (sloths, ant-eaters, and armadillos), and was described by Cuvier as a *pangolin gigantesque*; but the discovery of a complete skeleton (preserved in the Museum of the Jardin des Plantes, Paris), showed its true relationships.

Chalk. In geology chalk is a soft, friable, finely granular variety of limestone, and may in color range from pure white to grayish or buff. It is a marine deposit, composed principally of the shells of foraminifera. In the United States are some great beds of chalk of Upper Cretaceous Age. One is exposed for 250 miles from Austin to Sherman, Texas, and is nowhere much less than 600 feet thick. Chalk beds of the same age, Colorado stage, are found in Arkansas, Kansas, and in Montana, while the great chalk belt of Texas extends southwest from Austin into Mexico, being found in the states of Chihuahua, Coahuila, and Tamaulipas. In Arkansas and Texas this chalk formation and its associated chalky marls is being developed as furnishing excellent material for making Portland cement. No statistics of the amount thus used at present are available. In England the Upper Cretaceous series is marked by great beds of chalk and chalky limestones, and includes the Cenomanian, Turonian, and Senonian stages. Such strata extend across England from Flamborough Head on the east coast to west of Dover on the south coast. The chalk-mining industry of England is of importance, the total amount of chalk produced in 1901 being 4,399,000 tons. Part was used for cement-making and part for making refined chalk. (See CEMENT; CRETACEOUS SYSTEM.) ('United States Geological Survey Report, 1900-1,' Part III.; 'The Chalk of Northwestern Arkansas.')

ROBERT THOMAS HILL,
Of the United States Geological Survey.

Chalk, Red, or Reddle, a red, amorphous variety of hematite or sesqui-oxide of iron, containing much clay. To this fact it owes its firm, compact texture. It has an ochre-red color and is used chiefly by carpenters for making marks on wood, and by tailors for marking on cloth; the finer, by painters. It occurs in thin beds in clay-slate and gray wacke-slate in parts of Germany.

Chalkley, chāk'li, Thomas, American Quaker itinerant preacher: b. London 3 March 1675; d. Tortola, West Indies, 4 Sept. 1741. He spent his life preaching in New England and the Southern colonies; toward its end he made his home near Philadelphia. His chief work was his 'Life, Labors, and Travels,' whose quaintness made it popular even outside the Society of Friends, and has caused it to be several times reprinted.

Challemeil-Lacour, Paul Armand, pôl är-măn shâl-mêl-lâ-koor, French statesman: b. Avranches 19 May 1827; d. Paris 26 Oct. 1896. He was graduated at the École Normale in

1849 and soon fell under the ban of political proscription. He was elected to the French Chambers, however, and served the republic as senator, ambassador to Switzerland from 1874 to 1879, ambassador to England from 1880 to 1882, Minister of Foreign Affairs and president of the Senate in 1888. He was elected to the French Academy in 1893, and was editor of the 'Republique Française.'

Chal'enge, originally, an accusation, charge, or claim. A challenge to jurors is an objection either to the whole panel or array, that is, the whole body of jurors returned, or to the polls, that is, to the jurors individually; and it is either peremptory, that is, without assigning any reason, or for cause assigned. A peremptory challenge is allowed to be made only by the party accused, and not by the government or prosecuting officer, and only in capital cases; and is said to be permitted on the ground that a man is liable to conceive a prejudice against another from his mere looks and appearance, for which he can give no reason; and such may be the case of the accused; and it is conceded, in favor of life, that in such case he may exclude the juror without assigning any reason; and also on the ground that, by questioning a juror as to any objection to him, his prejudice may be thereby excited against the prisoner, who, to save himself from the effect of such prejudice, is permitted to have him rejected. The ground on which peremptory challenge is allowed supposes the prisoner's life to be in danger, and he is not entitled to it if he pleads in bar or abatement; for the trial of these pleas does not decide on his life. He must, before making such challenge, plead "not guilty," or some plea the trial of which decides on his life. Having pleaded such a plea, the accused might, by the common law, peremptorily challenge 35 jurors; but the statute 22 Hen. VIII. c. 14 limited the number to 20 in felony. The regulating statute now in force in Great Britain is 6 Geo. IV. c. 1. By the law of the United States a peremptory challenge of 35 jurors is allowed in trials for treason, and 20 in those cases of felony mentioned in the statute. A challenge of the whole panel may be made because the jury is illegally drawn or summoned, whereby it is not a legal jury; and a challenge of this description may be made by the government as well as by the prisoner. Challenge to the polls may be made both in civil and criminal suits for cause, as that the juror is an alien, not from the proper district, not duly qualified as a freeholder, not of suitable age, etc., or is near of kin to one of the parties, is biased, has been guilty of felony, is interested, or is subject to any other exception, according to the common principles of proceeding or the provisions of any statute on the subject. In courts-martial a prisoner who objects to either of the judges must assign his reasons. In other words peremptory challenges are not allowed in these courts. The privilege of challenging here belongs equally to the prisoner and the prosecutor. The right of challenging the members of a court-martial prevails on the continent of Europe, as well as in England and America.

A challenge to fight a duel is punishable in England with fine and imprisonment. In several of the United States this offense

CHALLENGER EXPEDITION—CHALMERS

is subject to the additional punishment of ineligibility to any public office, either for life or for a limited term. See DUEL.

Challenger Expedition, an expedition conducted in 1872-6, under the auspices of the British government, for the purpose of exploring the open ocean. The Challenger was fitted with everything that could be carried in the way of appliances for scientific research, and placed in command of Capt Nares. Prof. Wyville Thomson and scientific staff conducted the investigations and determined the depths of waters, the configuration and condition of the sea-floor, the fauna, the currents, atmospheric conditions, etc. During the three and a half years they covered nearly 70,000 nautical miles. The route was south to Madeira, thence to the Canaries, the West Indies, and north as far as Nova Scotia; south again to Cape Verde, then to Cape of Good Hope, Australia, the China Sea, Japan, the west coast of South America, through the Straits of Magellan, and back to England. The narrative of the expedition is told in popular form in Moseley's 'A Naturalist on the Challenger.' A complete account of the scientific results was gradually published in 50 splendid volumes, by Wyville Thomson and Dr. John Murray.

Chal'lis, James, English astronomer: b. Braintree, Essex, 12 Dec. 1803, d. Cambridge 3 Dec. 1882. In 1836 he was elected Plumian professor of astronomy at Cambridge and director of the observatory. In 1861 he was succeeded in the latter position by Adams, but retained the professorship of astronomy till his death. He is best known for his work upon the theory of astronomical instruments, and for his observations in connection with the discovery of the planet Neptune.

Chal'loner, Richard, English Roman Catholic bishop: b. Lewes, England, 29 Sept. 1691; d. London 12 Jan. 1781. His parents were Protestant dissenters from the established religion of England. After the death of his father young Challoner came under other influences and was received into the Catholic Church. At the age of 13 years he entered the English college at Douai in France and there, after completing his studies, was ordained priest and appointed professor of divinity. He remained in this station till 1730, when he was sent on the English mission with London as his field. He wrote many controversial tractates and many devotional manuals. Among his writings is 'The Catholic Christian Instructed,' a sort of advance catechism of the Roman Catholic faith, in the preface to which he made an ingenious and spirited reply to Dr. Middleton's famous 'Letter from Rome, Showing an Exact Conformity Between Popery and Paganism.' Middleton, smarting from the keenness of Challoner's controversial weapons, invoked against his adversary the penalties prescribed by the penal laws enacted for the extermination of the Roman Catholic religion. In 1741 Challoner was consecrated bishop and made coadjutor to the bishop in charge of the "London District," for the assumption of a see-title in England by a Roman Catholic bishop was a penal offense. Besides the work already mentioned, Challoner wrote the devotional work, 'Garden of the Soul,' which is still in general use among Roman Catholics as a prayer-book. He wrote also, in two

volumes, 'Memoirs of Missionary Priests and Other Catholics of both Sexes Who Suffered Death or Imprisonment in England on Account of Their Religion, from the Year 1577 till the End of the Reign of Charles II.'; also 'Britannia Sancta,' lives of English, Scotch and Irish saints. He revised the Douai-Rheims English version of the Old and New Testaments, improving and modernizing the style.

Chalmers, chà'mèrz or chāl'mèrz, Alexander, English journalist, editor, and miscellaneous writer: b. Aberdeen 29 March 1759; d. London 10 Dec. 1834. He received a good classical and medical education in his native city, where his father, the founder of the first Aberdeen newspaper, was a printer. About 1777 Chalmers went to London, and was employed as a contributor to the *St. James' Chronicle*, the *Morning Chronicle*, the *Morning Herald*, and various critical magazines and reviews. He edited numerous editions of the English classics, particularly the 'British Essayist' (45 vols. 12mo 1803), commencing with the 'Tatler,' and ending with the 'Observer,' together with prefaces, histories, and biographies; the 'Spectator'; 'Tatler'; and 'Guardian' (12 vols. 8vo 1822); an edition of Shakespeare, with historical and explanatory notes, in 1809; 'The English Poets from Chaucer to Cowper,' with Johnson's 'Lives,' and additional 'Lives,' by Chalmers (21 vols. royal 8vo 1810). The most important and valuable of Chalmers' extensive literary labors, however, was the 'General Biographical Dictionary' (32 vols. 8vo 1812-17), the fullest body of biographical information published up to his time in England, and which has rendered invaluable service to subsequent compilers. Chalmers was as much distinguished for painstaking accuracy as an editor, combining patient and intelligent investigation of facts with literary discrimination, as for the industry which enabled him to accomplish so large an amount of work.

Chalmers, George, Scottish antiquary: b. Fochabers, Elginshire, 1742; d. 31 May 1825. Having studied law at Edinburgh, he removed to America, where he practised that profession for upward of 10 years, till the colonies declared themselves independent. Chalmers being a keen Loyalist, returned to Great Britain, where he was in 1786 appointed to the office of clerk to the Board of Trade.

Previous to his appointment he had published 'Political Annals of the United Colonies' (1780); 'Estimate of the Comparative Strength of Great Britain During the Present and Four Preceding Reigns' (1782); and 'Opinions on Interesting Subjects of Public Law and Commercial Policy, Arising from American Independence' (1784). In 1790 he published his life of Daniel Defoe; in 1794 his life of Thomas Ruddiman (a very curious book); in 1800 he edited the works of Allan Ramsay, with an elaborate memoir of the poet; in 1805 the works of Sir James Stewart of Coltness, also with a life prefixed; and in 1806 the writings of Sir David Lindsay of the Mount. The first volume of his 'Caledonia' (1807), in quarto, displayed a vast extent of erudition and research. It professes to be an account, historical and topographical, of North Britain, from the most ancient to the present times; and the original intention of the author was, that it should be completed

CHALMERS

in 4 volumes 4to, each containing nearly 1,000 pages. Chalmers left the remainder of his great work nearly ready for the press; and it was subsequently published complete, with numerous annotations. He also wrote a 'Chronological Account of Commerce and Coinage in Great Britain' (1810).

Chalmers, George Paul, Scottish painter: b. Montrose 1833; d. Edinburgh 28 Feb. 1878. After serving in succession under a surgeon and a ship-chandler, he went to Edinburgh in 1853 in order to become an artist. He was elected an Associate of the Royal Scottish Academy in 1867, and four years later was elected to full membership. His pictures, which are characterized by rich coloring, consist mainly of portraits and subjects, though during his later years he produced several landscapes. The most important are the 'Favorite Air' (1864); 'End of the Harvest' (1873); 'Running Water' (1875); 'Threescore Years and Ten' (1875); 'Prayer' (1876); 'Knitting' (1876); and 'The Legend' (unfinished).

Chalmers, Thomas, Scottish clergyman: b. Anstruther Easter, Fifeshire, 17 March 1780; d. Edinburgh 30 May 1847. At the age of 12 he was sent to the University of St. Andrews, for the purpose of studying for the Church, and after passing through a curriculum there seven years, was licensed as a preacher in July 1799, the rule of the Scottish Church requiring that a licentiate shall have reached the age of 21 being dispensed with in his case, in virtue of the exceptional clause in favor of those possessing "rare and singular qualities."

In May 1803 he was presented to the parish of Kilmany, in the northeast of Fifeshire, and opened classes of his own for teaching mathematics in the town of St. Andrews. These were so successful that he commenced a class in chemistry also, his lectures on and demonstrations in which created quite a sensation. About this time his views as to the obligations of a Christian pastor were very different from what he was subsequently led to entertain, and he deemed it a sufficient fulfilment of these to return to Kilmany on the Saturday evenings, and from thence back to St. Andrews on the Monday mornings, devoting the bulk of his time to scientific pursuits. In 1808 he published an 'Inquiry into the Extent and Stability of National Resources,' the object of which was to show that the Berlin decree would not touch the real foundations of the prosperity of Great Britain.

In 1813 his article on Christianity appeared in the Edinburgh 'Encyclopædia,' and shortly afterward his review of Cuvier's 'Essay on the Theory of the Earth,' in the 'Christian Instructor.' In this last he propounded the interpretation of the first verses of Genesis, afterward adopted by Dr. Buckland, with a view to make the truths of revelation and the discoveries of geological science harmonize. In his lectures at St. Andrews in 1803 he had already said, "The writings of Moses do not fix the antiquity of the globe. If they fix anything at all, it is only the antiquity of the species." His fame as a preacher had by this time extended itself throughout Scotland, and a vacancy having occurred in the Tron Church of Glasgow, he was elected to the charge by a large majority of the town-council, and inducted on 21 July 1815. In the month of November fol-

lowing he commenced his series of astronomical discourses, in accordance with a custom observed in Glasgow, of the city ministers delivering in rotation a course of sermons in the Tron Church on Thursdays. These created a sensation such as no sermons had ever before produced in Glasgow. It is related, that when the hour of delivering them arrived, merchants and men of business would regularly leave their desks and proceed to the Tron Church, while the more liberal among them would, in addition, grant a similar indulgence to their clerks and assistants. In the commencement of 1817 these discourses were published, and attained a sale of nearly 20,000 copies by the end of the year. They raised their author to the position of the first preacher of the day, and in a visit which he shortly afterward paid to London, the most distinguished literati and statesmen crowded to listen to the wondrous oratory of the Scottish divine.

The main object which engaged Chalmers on his arrival in Glasgow was the reorganizing of the parochial system, so as to provide a machinery by which the destitute and outcast might be visited and reclaimed, and the young instructed in the lessons and duties of religion. Especial efforts were directed toward the establishment of Sabbath-schools. Great exertions were also made by him to get new churches erected throughout Glasgow, the church accommodation for which comprehended scarcely a third of the inhabitants. In this he ultimately succeeded, and in addition, a new parish and church (St. John's) were erected and endowed expressly for himself by the town-council of Glasgow. To this he was in 1819 transferred from the Tron. The fatigues, however, which unrelenting attention to parochial affairs involved were becoming too much for his health, and on the vacant chair of moral philosophy, in the University of St. Andrews, being offered to him, he accepted it.

In 1827 the divinity chair in the University of Edinburgh became vacant, and Chalmers was unanimously elected to it by the town-council 31 October. This appointment he held till the disruption of the Scottish Church in 1843. In 1832 he published his 'Political Economy,' and shortly afterward appeared his contribution to the celebrated Bridgewater Treatises, 'On the Adaptation of External Nature to the Moral and Intellectual Constitution of Man.' In 1834 he was elected a corresponding member of the Royal Institute of France. An important matter which now largely engaged his attention was the subject of church extension, which he had zealously advocated from the days of his ministry in Glasgow. But Lord Melbourne's government was little disposed to aid the Church of Scotland on this occasion, and it was consequently obliged to carry out its scheme on the voluntary principle. Amid the various public movements with which Chalmers' name stands connected, there is none in which it more prominently occurs than in relation to the great non-intrusion movement in the Scottish Church. Throughout the whole of this memorable contest, from the passing of the veto law by the General Assembly to the Disruption in 1843, he acted as the leader of the Evangelical party in their struggles with the civil power, and may be regarded as the founder of the Free Church, of the first assembly of which he was

CHALONS-SUR-MARNE — CHALYBEATE WATERS

moderator. He was also the originator of the sustentation fund, out of which the ministers of that body are principally supported. Having vacated at the Disruption his professorial chair in the Edinburgh University, he was appointed, on the establishment of a new college in connection with the Free Church, to the offices of principal and primarius professor of divinity in that institution. The energy which made Chalmers remarkable as an orator was infused into all his practical undertakings; and in the social and religious movements which he inaugurated he has left his mark in the history of his country. His published works are very numerous, embracing sermons, tracts, essays, works on political economy, the parochial system, church establishments, etc. They exhibit the same energy of conviction, together with a breadth and profundity of view, which, though many of his theories have not been accepted by other thinkers, will always make them a rich mine of suggestion and instruction to inquirers into the complicated relations of human society. See 'Lives,' by Hanna (1849-52); Fraser (1881); Mrs. Oliphant (1893); Blaikie (1897).

Châlons-sur-Marne, shâ-lôn sŭr marn, France, a city and capital of the department Marne (Champagne), 107 miles east of Paris. It lies on the right bank of the Marne, here crossed by a stone bridge of three arches, built in 1787. Low walls now supply the place of the old ramparts, the entrance being by six gates, which open to six main roads. The principal public buildings are the cathedral, restored by Louis XIV. after having been destroyed by fire in the 13th century; the church of Notre Dame, of the 12th and 13th centuries, and since restored; the Hotel de Ville, built in 1772; the Hotel de la Prefecture, built in 1764, one of the finest buildings of the kind in France; public library, containing 30,000 volumes; museum, hospital, etc. There is a promenade, occupying about 18 acres, formerly planted with superb elm trees, which the Germans cut down for fuel during the Franco-Prussian War. Châlons is the seat of a bishopric, and of one of the schools of arts and trades, where 300 pupils are maintained and instructed at the public expense. There are manufactures of woollen and cotton goods; cotton mills, tanneries, etc. Châlons was fortified and embellished by the Romans. Christianity was preached here about the year 250. In 451 Attila was defeated before its walls. From the 10th century it formed a kind of independent state, governed by its bishops, till 1360, when it was united to the crown. A celebrated camp was established by Napoleon III. at the distance of about 18 miles from Châlons for the purpose of training the French troops. In 1870 the town was occupied by the Germans after MacMahon's withdrawal. Pop. (1903) about 27,000.

Châlon-sur-Saône, sŭr sôn, France, a town in the department of Saône-et-Loir, 33 miles north of Macon, at the commencement of the Canal du Centre. It is situated on the Saône, here crossed by a bridge of five arches, communicating with the suburb of St. Laurent. It is irregularly built, and is surrounded by a wall and the remains of ancient fortifications. The public buildings include the church of St. Vincent, built in 1386-1440, a library with 22,000

volumes, a gallery of painting, etc. Châlon is the seat of a tribunal of first resort and of commerce, and has a communal college. There are foundries, dye-works, manufactories of leather, cloth, glass, etc., and a considerable trade in grain, flour, and wines. The Saône becomes navigable for steamboats here, and there is steamer connection with Lyons. Cæsar had grain magazines at Châlon, and it became the capital of Burgundy under Gontran. In 1273 Edward I. of England, being invited to a tournament here on his return from Palestine, attended with 1,000 men-at-arms; and some disputes having arisen, the English attacked the French, killed a great number, and left the tilting-ground strewn with the dead. This event is known as "the little war of Châlon." The town suffered considerably from the civil wars of the 15th and 16th centuries, and from the invasion of the allies in 1814. Pop. (1896) 26,630.

Chalybeate (ka-lib'ë-ät) **Waters**, those which contain salts of iron in sufficient quantity to give them a special value in the treatment of cases of anæmia, etc. Iron or steel waters are not the only mineral waters in which some form of iron is found. Indeed in nearly all this ingredient exists, but in very many in such small quantity, while other ingredients are so conspicuous, that the character of the water can hardly be supposed to be affected by that metal. Those springs most successfully resorted to contain from one third to nine tenths of a grain of iron, in the form of carbonate, in 16 ounces. Some springs are classed as iron springs which contain barely one fifth of a grain in 16 ounces of water. What are called pure iron springs are those which contain but a few grams of dissolved solids, a salt of iron existing to some appreciable amount; compound iron springs contain moderate quantities of other salts, such as Epsom and Glauber's salts, common salt, sulphate of lime, besides being rich in carbonic acid gas. The reason for the use of iron waters is that iron is a necessary ingredient of the blood, and in certain conditions promotes the formation of blood. Small doses only should be employed, as excess may irritate the stomach and bowels and produce constipation. It has been found that iron springs are most useful in cases of poverty of blood quickly produced, for example, by loss of blood by bleeding from the nose, or from wounds; by drain occurring from the blood, owing to diarrhoea, suppuration, and other profuse discharges; in cases of chlorosis in young girls; and in poverty of blood dependent on acute disease, in which cases they materially promote convalescence. Iron springs are also used in disorders of menstruation, especially in its suppression; in malarious conditions and poverty of blood due to residence in tropical countries; and in neuralgia, sterility, and impotency due to enfeebled conditions of general health. In such cases as these last the improvement is not so rapid, and is often best promoted by waters which, besides the iron, contain marked quantities of other ingredients, like common salt. It is chiefly in the form of carbonate that the iron exists, and this is the best form for administration. The presence of carbonic acid gas in the water keeps the carbonate of iron in solution, and when the water

CHALYBITE—CHAMBERLAIN

stands a yellowish rust is deposited. Iron springs are used for bathing, but it is not now believed that the iron produces any effect on the skin or is absorbed from the bath. Among the chief chalybeate springs are those at Saratoga, N. Y.; two at Harrogate, England, called the Muspratt and the Tewitt, the latter pure; a pure one at Tunbridge Wells; several at Bath; one at Bocklet, near the salt spring of Kissingen, containing much common salt and carbonic acid gas; those of Antogast, Freiersbach, Griesbach, Petersthal, and Rippoldsau, in the Black Forest region, at altitudes of from 1,280 to 1,886 feet; one at Orrezza, in Corsica, with much carbon dioxide and traces of arsenic; many at Spa; one at St. Moritz, Switzerland, situated at an elevation of 5,710 feet; one at Santa Catarina, Italy, three miles from Bormio, at a height of 5,600 feet; several very popular pure ones at Schwalbach in Nassau; one at Pyrmont, Waldeck; and one at Cheltenham, with a very high proportion of iron carbonate.

Chalybite, kál'i-bít, or **Siderite**, a common iron ore. It is iron protocarbonate, FeCO_3 , containing 48.2 per cent of metallic iron. It occurs in rhombohedral crystals, also botryoidal, globular, compact or earthy, but most commonly cleavable-massive. Its hardness is 3.5 to 4, but in the siliceous variety, clay iron-stone, found in many coal formations, it sometimes runs up to 7. Its specific gravity is about 3.85, lustre vitreous to pearly, color usually brown or yellowish-gray. It is generally nearly opaque. It occurs in enormous quantities in Austria, also at Roxbury, Conn. It is a frequent associate of silver, lead, and copper ores. Clay iron-stone is considered the most important iron ore of England.

Cham, shàn (pseudonym of AMÉDÉE DE NOÉ), French caricaturist: b. Paris 26 Jan. 1819; d. 6 Sept. 1879. He adopted the name Cham (Ham) as one of the sons of Noah, his father being M. de Noé (Noah). The son of a peer of France, he attended the polytechnic school; but following his artistic inclinations, became a pupil of Delaroche and Charlet, and acquired distinction as a caricaturist by his spirited and humorous contributions to the Paris 'Charivari,' and by the publication of several collections of caricatures, among the best of which are 'Annee's Comiques' (1880); 'Les Folies Parisiennes' (1883).

Chama, ká'ma, a genus of mollusks, the typical one of the family *Chamidae*. The shell has foliaceous valves, the upper one the smaller, one valve attached to another body by the left umbo; the hinge tooth of the free valve is received between two teeth of the other. The chamas are found less than 50 fathoms deep in tropical seas, especially among coral reefs. Fifty recent species are known, and 40 fossil, the latter from the Cretaceous onward. The still existing *Chama gigas* sometimes weighs 300 pounds, and may measure four feet across. The byssus by which it adheres to the rock is so tough that a hatchet is required to cut it through. One valve is sometimes used in churches as a baptismal font.

Chamærops, ka-mě'rōps, a genus of palms established by Linnæus, and remarkable as containing those species of the palm family which are found at the greatest distance from the equator. It is characterized by its flabelliform

leaves, polygamous and sometimes dioecious flowers, and its triple monospermous drupes. The *C. humilis* is the only palm which is seen growing in the open air in any part of Europe. It is confined, however, to its hottest parts, and even there is generally only from four to five feet high. Its trunk, from five to six inches in diameter, is closely covered with triangular hard scales, the bases of the old leaves; the new leaves grow in a tuft at the top. Sometimes the stem does not appear at all; and the leaves, apparently issuing from the ground in the form of a large fan, have procured for the plant the name of the fan-palm. In hot-houses the stem attains the height of 15 feet or more. The leaves are used for thatch and other purposes, and they furnish a large quantity of fibre, which forms an article of commerce and yields a material that may be used instead of horse-hair. *C. fortunei*, a species from northern China, stands the climate of southern England quite well. Brazilian grass is a fibre obtained from *C. argentea*.

Chamalari, chà-ma-là'rē, or **Chamalhari**, a peak of the Himalaya Mountains, at the western extremity of the boundary line between Bhutan and Tibet. Height, 23,929 feet.

Chamba, chām'ba, a state of the Punjab district, British India, north of the districts of Kangra and Gurdaspur; area 3,216 square miles. It is a mountainous tract, shut in on almost every side and traversed by two hill-ranges. The crops consist of all kinds of grain and the supply of iron and slate is plentiful. The sanitarium of Dalhousie is in this district. Pop. 130,000.

Chambal, chūm'būl, a river in Rajputana, Central Provinces of British India, flowing into the Jumna; length, 750 miles.

Cham'ber, a term having various technical meanings. The chamber of a cannon is that part of the bore of a cannon which receives the powder with which it is charged. The chamber of a mine is the place where the charge of powder is lodged that is to be used for blowing up the works. In several languages chamber is used to designate a branch of government whose members assemble in a common apartment. A chamber of commerce is a board or association to promote the interests of the trade and merchandise. See CHAMBERS OF COMMERCE.

Chamberlain, Abiram, American governor: b. Colebrook, Conn., 7 Dec. 1837. He was educated in the public schools and at Williston Seminary, Easthampton, Mass., making a special study of civil engineering. In 1856 he removed to New Britain, Conn., where he learned the trade of rule-making and practised civil engineering with his father. He was teller of the New Britain National Bank for five years, cashier of the Home National Bank of Meriden, 1867, and its president since 1881. He has held local municipal offices, was a member of the General Assembly, 1877, comptroller 1901-2, and governor of Connecticut, 1903-4.

Chamberlain, Alexander Francis, American anthropologist: b. Kenninghall, England, 12 Jan. 1865. He was graduated at Toronto University in 1886, and became a member of numerous learned societies. Since 1892 he has been lecturer on anthropology at Clark Uni-

CHAMBERLAIN

versity, Worcester, Mass. He has written 'The Child and Childhood in Folk-Thought' (1896); 'The Child; a Study in the Evolution of Man' (1900); and many essays on similar topics.

Chamberlain, Basil Hall, English Japanese scholar: b. Southsea 18 Oct. 1850. He is a grandson of Basil Hall (q.v.). He is emeritus professor of Japanese and philology at the Imperial University of Tokyo, and has published 'The Classical Poetry of the Japanese' (1880); 'Translation of the Kojik' (1883); 'A Romanized Japanese Reader' (1886); 'Language, Mythology, and Geographical Nomenclature of Japan in the Light of Aino Studies' (1887); 'Luchuan Grammar' 1895; 'Handbook of Colloquial Japanese'; 'Things Japanese.'

Chamberlain, Daniel Henry, American lawyer: b. West Brookfield, Mass., 23 June 1835. He graduated at Yale with high honors in 1862, and at Harvard Law School in 1863. In 1864 he was commissioned lieutenant in the 5th Massachusetts colored cavalry, served in Maryland, Louisiana, and Texas, and was promoted captain. In 1866 he settled as a cotton planter in South Carolina. Upon the call for a constitutional convention, he was chosen a delegate, and was subsequently elected attorney-general, a position he held for four years. From 1872 to 1874 he practised law at Columbia, S. C. He was governor of the State 1874-7. Though renominated in 1876 and re-inaugurated in January 1877, his election was contested by Wade Hampton, the Democratic candidate for governor. After the inauguration of President Hayes, both contestants were invited to a conference at Washington, which resulted in the U. S. troops (which had been sent to support Chamberlain) being withdrawn from South Carolina, and Gov. Chamberlain withdrawing his claim to election. He resumed law practice in New York city until his retirement to West Brookfield, Mass. He has published several addresses and pamphlets, the latest of which is 'Charles Sumner and the Treaty of Washington' (1902).

Chamberlain, Henry Richardson, American journalist: b. Illinois 25 Aug. 1859. He engaged in journalism in Boston and New York, being managing editor of the *New York Press* in 1888, and of the *Boston Journal* in 1891, and since 1892 has been London correspondent for the *New York Sun*. He has published 'Six Thousand Tons of Gold' (1894).

Chamberlain, J. Austen, English politician, son of Joseph Chamberlain (q.v.): b. 1863. He was educated at Rugby, and Trinity College, Cambridge. He was financial secretary to the Treasury, 1900-2, and has been postmaster-general from 1902. In appearance he bears a striking resemblance to his father, the noted colonial secretary.

Chamberlain, Jacob C., American missionary: b. Sharon, Conn., 13 April 1835. He graduated at Western Reserve College 1856; studied at the Dutch Reformed Church theological seminary 1859, and also took a medical degree at the College of Physicians and Surgeons in New York. In December 1859, he went as a medical missionary to southern India, and has resided in the Madras presidency ever since, with the exception of three visits to the

United States. He established a hospital and dispensary at Madanapalli 1868, and another at Palamanair 1872. He translated the Reformed Church liturgy into Telugu Madras 1873), and also 'Hymns for Public and Social Worship' (1884). He has written 'The Bible Tested' (1878; 7th ed. 1885); 'Native Churches and Foreign Missionary Societies' (1879); 'Winding up a Horse; or Christian Giving' (1879); 'Break Cocoanuts Over the Wheels: or All Pull for Christ' (1885).

Chamberlain, Joseph, English statesman: b. London July 1836. He was educated at University College School, and entered his father's screw factory at Birmingham, from which, however, he retired in 1874. He had by this time acquired considerable celebrity as a Radical politician. In 1868 he was appointed a member of the Birmingham town-council, was mayor of Birmingham from 1873 to 1876, and chairman of the Birmingham school-board from 1874 to 1876. After unsuccessfully contesting Sheffield against Mr. Roebuck in 1874, he was returned for Birmingham without opposition in June 1876. He soon made his mark in Parliament, and on the return of the Liberals to power in 1880 was appointed president of the Board of Trade, with a seat in the cabinet. To Mr. Chamberlain's exertions was due the passing of the Bankruptcy Bill, but his efforts to amend the Merchant Shipping Acts were unsuccessful. Meanwhile his influence was increasing rapidly outside the House; he came to be regarded as the leader of the extreme Radical party, and enunciated schemes for the regeneration of the masses which were based on the doctrines of the "restitution" of land and the "ransom" of property. During the last hours of Mr. Gladstone's government he was understood to be opposed to the renewal of the Irish Crimes Act; and during the general election of 1886 he was most severe in his strictures on the moderate Liberals, and produced an "unauthorized" programme (in opposition to that of Mr. Gladstone), which included the readjustment of taxation, free schools, and the creation of allotments by compulsory purchase. He was returned free of expense by the western division of Birmingham. On 1 Feb. 1886 he became president of the Local Government Board, but resigned on 26 March, because of his strong objections to Mr. Gladstone's Home Rule measures for Ireland, and after the "Round Table" conference had failed to reunite the Liberal party he assumed an attitude of uncompromising hostility to his old leader's new policy, and was bitterly assailed by Home Rulers as a renegade. He became leader of the Liberal-Unionists when the Duke of Devonshire went to the Upper House. Lord Salisbury sent him to Washington as commissioner on the Canadian fishery dispute, and in 1895 he was made colonial minister in the Unionist Cabinet.

In that capacity his chief aim has been to unite more closely the colonies with the mother country. During his tenure of office he has had various difficult matters to handle, such as the negotiations concerning the "Jameson raid" on the Transvaal in December 1895, and the French claims in West Africa. On news of the "raid" being received, Mr. Chamberlain at once repudiated all connection with it on the part

CHAMBERLAIN — CHAMBERLIN

of the British authorities; and he subsequently denied in the most distinct manner having had any personal foreknowledge or suspicion of what was about to take place. His conduct of the negotiations with the South African Republic preceding the outbreak of war in 1899 met with enthusiastic support from many and severe censure from others. Since the conclusion of the Boer war he has visited South Africa and by his personal influence done much to bring about a good understanding between the Boers and the English government. He had much to do with the passing of the Workmen's Compensation Act of 1897. In 1896 the students of Glasgow University elected him lord rector. He carried the Australian Federation measure in Parliament (1900), and later had to face opposition from within the Liberal party. In 1888 he was married to Mary, daughter of William C. Endicott, secretary of war in President Cleveland's first administration. He resigned from the Cabinet in 1903, owing to his pro-tariff views.

Chamberlain, Joshua Lawrence, American army officer and educator: b. Bangor, Maine, 8 Sept. 1828. He was graduated at Bowdoin College in 1852, and entered the volunteer service of the Union in 1862, was promoted to the rank of brigadier-general by Gen. Grant, for bravery at Petersburg 1864; became a major-general in 1865, and received the colors of Lee's army on its surrender. In 1867-71 he was governor of Maine, and in 1871-83 was president of Bowdoin, resigning to engage in business in New York.

Chamberlain, Mellen, American lawyer: b. Pembroke, N. H., 4 June 1821; d. Chelsea, Mass., 25 June 1900. He graduated at Dartmouth College in 1844, and at the Harvard Law School in 1848. In 1849 he was admitted to the bar, opened a law office in Boston, and made his residence in Chelsea, where, during 51 years of citizenship he served the town in many public capacities. In 1858 and 1859 he was a member of the Massachusetts House of Representatives, and of the Senate in 1863-4. He was associate justice of the municipal court of Boston 1866-70, and chief justice 1870-8. On 26 Aug. 1878 he was chosen librarian of the Boston Public Library, serving until ill health compelled his retirement in 1890. During his administration the new library building was begun, and the corner-stone laid. Throughout his life he was a close student and investigator of American history. Besides important chapters in Winsor's 'Memorial History of Boston' (1881), and 'Narrative and Critical History of America' (1888), he wrote: 'John Adams, the Statesman of the Revolution' (1884); 'The Authentication of the Declaration of Independence' (1885); 'John Adams, the Statesman, with Other Essays and Addresses' (1898).

Chamberlain, Montague, American naturalist: b. St. John, New Brunswick, 5 April 1844. He was educated privately, both his parents being teachers. Though engaged in mercantile pursuits, he devoted much time to the study of natural history and came to be well known as an ornithological writer. In 1889 he became assistant secretary of the Lawrence Scientific School of Harvard University, and since 1893 has been secretary. He is a member of

several scientific bodies, and his chief publications are: 'Canadian Birds' (1870); 'Birds of New Brunswick' (1882); 'Mammals of New Brunswick' (1884); 'Systematic Table of Canadian Birds' (1887); 'Birds of Greenland' (1892); 'Some Canadian Birds' (1895); 'Maliseet Vocabulary' (1899); 'The Penobscot Indians' (1899).

Chamberlain, Nathan Henry, American clergyman: b. Bourne, Mass., 25 Dec. 1830; d. there 1 April 1901. He graduated at Harvard, 1853, and studied theology at the divinity school there, and at Heidelberg, Germany, eventually becoming a Unitarian minister. He was pastor at Canton, Mass., 1857-9, and at Baltimore, Md., 1860-3. He then took orders in the Episcopal Church, and became rector at Birmingham, Conn., 1864-7; Morrisania, N. Y., 1868-71; Milwaukee, Wis., 1871-3; Somerville, Mass., 1874-9; East Boston, Mass., 1882-9. He then retired to devote himself to literary pursuits. His books are: 'Autobiography of a New England Parish' (1864); 'The Sphinx in Aubrey Parish' (1889); 'What is the Matter with our Tariff and its Taxes' (1890); 'Samuel Sewall and the World He Lived In' (1897), an admirable study of colonial life in New England; 'Life of Sir Charles Napier'; 'An Itinerary of Cape Cod.'

Chamberlain, Thomas Crowder, American geologist: b. Mattoon, Ill., 25 Sept. 1843. He was educated at Beloit College and the University of Michigan; was professor of natural sciences in Whitewater Normal School, Wis., 1869-73; professor of geology at Beloit College 1873-82; president of the University of Wisconsin 1887-92; and has been dean of the scientific faculty of the University of Chicago from 1892. He was assistant State geologist of Wisconsin 1873-6, and State geologist from 1876. He is the author of 'Geology of Wisconsin' and of many important papers printed by the United States Geological Survey.

Chamberlain, a court officer, originally employed, as the name indicates, to take charge either of the private apartments of a prince, or of a treasury, called in the 10th century *camera* (whence the word chamber). The golden key, which is worn by the chamberlains of the European courts on two small golden buttons (as well as the buttons themselves, when the key is omitted), indicates also the origin of the office. At present the employment of chamberlains (when their office is not merely nominal) is to attend on the persons of the princes and their consorts. There is generally a chief or high chamberlain. This officer in England is called Lord Great Chamberlain of England. His office is one of great antiquity and honor, being ranked as the sixth great office of the English crown. He dresses and undresses the king before and after the coronation. There exist also a lord chamberlain of the household, a lord chamberlain of the queen's household, etc.

Chamberlin, Joseph Edgar, American journalist: b. Newbury, Vt., 6 Aug. 1851. Until 1890 he was on the staffs of papers in Newport, R. I., Fall River, Mass., Chicago, and Boston. From 1891 to 1898 he was assistant editor of the 'Youth's Companion,' an essayist and magazine writer. During the Spanish war he was war correspondent of the New York *Evening Post* in Cuba. He has published: 'The Lis-

MR. JOSEPH CHAMBERLAIN.

tener in the Town'; 'The Listener in the Country.'

Chambers, chām'bérz, Charles Julius, American journalist and novelist: b. Bellefontaine, Ohio, 21 Nov. 1850. In 1870 he traveled through the West Indies, Europe, the United States, and Canada, as special correspondent of the *New York Herald*. In 1876 he published an account of his few weeks of experience (incognito) in an insane institution, entitled, 'A Mad World,' which excited great interest. He has also published several novels: 'On a Margin'; 'Lovers Four and Maidens Five'; 'Chats on Journalism'; 'Missing'; 'The Rascal Club'; 'One Woman's Life.'

Chambers, Edward Thomas Davies, Canadian journalist: b. Saffron Walden, Essex, England, 1852. He removed to Canada in 1870, and after teaching a short time entered journalism, becoming chief editor of the *Quebec Daily Chronicle* in 1897. He has published 'The Port of Quebec' (1890); 'The Haunts of the Ouaniche' (1891); 'Quebec: Ancient and Modern' (1892); 'Quebec, Lake Saint John and the Saguenay' (1893); 'Chambers' Guide to Quebec' (1895); 'The Book of the Ouaniche and its Canadian Environment' (1896).

Chambers, Ephraim, English miscellaneous writer, and compiler of a popular 'Dictionary of Arts and Sciences': b. Kendal, Westmoreland, about 1680; d. 15 May 1740. On leaving school he was apprenticed to a mathematical instrument and globe maker in London. Here he acquired such a taste for the study of science, and made so much proficiency in it, that he not only formed the design of compiling his famous 'Cyclopædia,' but actually wrote some of the articles for it behind his master's counter. The first edition of this work was published in 1728, and Chambers was soon after chosen F.R.S. Two subsequent editions, in 1738 and 1739, appeared previously to his death. A French translation of the 'Cyclopædia' was the basis of the 'Encyclopédie' of Diderot and D'Alembert. A revised and enlarged edition was brought out first by Scott and Mill, and afterward, 1781-6, by Dr. Rees, who latterly built up on it the work known by his own name.

Chambers, George Frederick, English publicist: b. 18 Oct. 1841. He was educated at King's College, London, and has filled various public appointments. Besides editing various legal text-books, guides to Sussex, etc. he is the author of 'Hand-book of Descriptive and Practical Astronomy'; 'Pictorial Astronomy' (1891); 'The Story of the Sun, Stars, Eclipses, Weather' (1896-9), etc.

Chambers, Robert, Scottish prose-writer and publisher: b. Peebles 10 July 1802; d. Saint Andrews 17 March 1871. He and his brother William began in poverty as small booksellers; issued penny leaflets of useful information for the people, written in a clear and simple though not infantile style, which became very popular, and at last took regular periodical form in 'Chambers' Journal,' and the great publishing-house which bears the name of both developed gradually. The 'Chambers' Encyclopædia for the People' was the outgrowth of the 'Journal,' and edited by the brothers. Robert wrote also 'Traditions of Edinburgh'; 'History of the British Empire'; 'Domestic Annals of Scotland';

'The Book of Days'; 'Cyclopedia of English Literature'; 'Ancient Sea Margins'; etc., but his most noted book was the anonymous 'Vestiges of Creation,' for years an unequaled theological-scientific sensation.

Chambers, Robert William, American artist and novelist: b. Brooklyn, N. Y., 26 May 1865. He has written: 'In the Quarter' (1893); 'The King in Yellow' (1893); 'The Red Republic' (1894); 'A King and a Few Dukes' (1894); 'The Maker of Moons' (1895); 'Oliver Lock'; 'The Mystery of Choice' (1896); 'Lorraine' (1896); 'Ashes of Empire' (1897); 'The Haunts of Men' (1898); 'The Cambric Mask' 1899; 'Outsiders' (1899); 'The Conspirators' (1900); 'Cardigan' (1901); and 'With the Band,' a volume of ballads.

Chambers, Talbot Wilson, American clergyman: b. Carlisle, Pa., 25 Feb. 1819; d. New York 3 Feb. 1896. He graduated at Rutgers, 1834; studied theology at the Reformed Church Seminary there, and also at Princeton. He was pastor of the Reformed Dutch Church in Somerville, N. J., 1839-49. In 1849 he was installed a pastor of the Collegiate Dutch Church in New York, and remained in association with the Middle Dutch Church congregation until his death. He was a member of the American Bible Revision Committee, and for many years chairman of the committee on versions of the American Bible Society. He wrote: 'The Noon Prayer Meeting in Fulton Street' (1857); 'Mémorial of Theodore Frelinghuysen' (1863); 'Exposition of the Book of Zechariah' (1874), in 'Lange's Commentary'; 'The Psalter a Witness to the Divine Origin of the Bible' (1875); 'Companion to the Revised Version of the Old Testament' (1885).

Chambers, Sir William, English architect: b. of Scottish parents, Stockholm, Sweden, 1726; d. London 8 March 1796. He was educated at Ripon, in Yorkshire, and while very young went as supercargo to the East Indies, resided for some time in China, and brought back many drawings of Chinese buildings and costume, which were afterward published. He then devoted himself to the study of architecture, and on returning from travels in France and Italy was appointed drawing master to the Prince of Wales, afterward George III. He laid out the royal gardens at Kew in the Chinese style, and built the villa of the Earl of Besborough at Roehampton, in the Italian style, a mansion for Lord Abercorn, near Edinburgh, and houses for Lord Melbourne and the Earl of Gower, at Whitehall and in Piccadilly. His masterpiece was Somerset house in London, which he rebuilt in 1775. He published in 1759-68, a 'Treatise on Civil Architecture,' several times reprinted; in 1772, a 'Dissertation on Oriental Gardening.'

Chambers, William, Scottish publisher and miscellaneous writer: b. Peebles 16 April 1800; d. Edinburgh 20 May 1883. He was a brother of Robert Chambers (q.v.). He published 'Things as They Are in America' (1853), 'American Slavery and Color' (1857); 'France: Its History and Revolutions' (1871); 'Stories of Old Families,' etc. In 1859 he bestowed on his birthplace the commodious suite of buildings known as the Chambers Institute, comprising a library, reading-room, lecture-room, art-gallery, and museum. Of his native county he published

CHAMBERS OF COMMERCE — CHAMBORD

a history in 1864. In 1865 he was elected Lord Provost of Edinburgh, in which capacity he organized and carried out many extensive and useful measures of sanitary improvement. Between 1871 and 1883 he spent upward of \$100,000 on the restoration of St. Giles' Cathedral, Edinburgh.

Chambers of Commerce, associations formed by tradesmen and merchants for the purpose of protecting and furthering the commercial interests of the community to which the chamber belongs. Among the various methods employed to promote the ends of such associations are the following: The influence of legislative action for the benefit of commerce, the collection of trade statistics, the gaining of economical or other advantages, by combination, the settlement by arbitration of mercantile disagreements. The oldest body of the nature of a chamber of commerce was started in Marseilles at the close of the 17th century. The value of such bodies became apparent and they sprang up rapidly throughout the civilized world. In mediæval Venice and in the Hanse towns they do not seem to have existed in the sense in which they are understood to-day. The first institution of the kind in the United States, the New York Chamber of Commerce, was organized in 1768 and incorporated by royal charter from King George III. in 1770. There are similar bodies in every city and town of consequence in the United States. The oldest Chamber of Commerce in Great Britain, that of Glasgow, dates from 1783. Edinburgh followed two years later, and for long held a leading position, but the most important British chamber of commerce at the present time is that of London, founded so lately as 1881. It has instituted a series of examinations in commercial subjects, and lectures are delivered under its auspices. Junior and senior commercial certificates are granted after examination to those who display the amount of knowledge required. In 1860 there was formed an Association of Chambers of Commerce of the United Kingdom, which holds annual meetings in London. It includes nearly 100 chambers.

The extension of the functions of chambers of commerce in the United States has been considerable in the decade between 1890 and 1900. The movement had its origin in Germany and grew out of the organized efforts of the last 20 years to foster the world commerce of the empire. The chambers of commerce in leading cities like Berlin and Hamburg undertook the commercial training of young men, with a view to their future advancement in mercantile life and the consular service. The result was the securing of a higher order of talent in such pursuits. The hint thus thrown out was promptly taken up in the United States. The New York Chamber of Commerce, in 1899, voted a fund for the endowment of a lecture course on commerce at Columbia University; in Chicago a chair of commerce was established by that city's chamber at the University of Chicago, and in August 1900 a School of Commerce, Accounts, and Finance was established by the University of New York. Students were assured in the event of a satisfactory course of study, that they would be given posts in leading commercial establishments or appointed to consular offices so far as influence could attain that

result. The movement is destined to mark a new era in the influence of chambers of commerce.

Chambersburg, Pa., a borough and county-seat of Franklin County, on the Conococheague and Falling Creeks and the Cumberland Valley and W. and the Philadelphia & R. R.R.'s, 49 miles west-southwest of Harrisburg. In Early's raid in the Civil War Gen. McCausland entered Chambersburg with Confederate cavalry, 30 July 1864, and demanded a tribute of \$100,000 gold; this not being paid the place was set on fire and two thirds of it burned, causing a loss of \$1,000,000. It was soon rebuilt, chiefly of brick or stone, and is now the seat of Wilson College for women, and has an academy, several churches and newspapers, public schools, manufactories, machine shops, two national banks, and an assessed property valuation of \$3,000,000. In the environs blue limestone, freestone, and marble abound. Pop. (1900) 8,864.

Chambertin, shān'-bēr-tān, a superior red Burgundy wine, named after the place where it is produced, in the department of Côte d'Or.

Chambéry, shān-bā-rē, France, capital city of the department of Savoy, at the junction of two small rivers, near the Isère, between two mountains on the border of a fertile plain. It is an archbishop's see, and contains a cathedral, six hospitals, a castle, now the prefecture, the palace of justice, barracks, a covered market, a college, a museum, and a public library with 25,000 volumes. The old ramparts have been converted into public walks. In its vicinity are excellent baths, much frequented in summer. Its suburbs are large with many fine villas. It has considerable manufactures and distilleries; trade in grain, silk, cattle, etc. Chambéry was founded about the 10th century. It was under feudal lords till 1230, when it was ceded to Thomas, first Count of Savoy, who built the castle, where the princes of the house of Savoy resided till the government was removed to Turin. The town was surrendered to the French in 1792, and became the capital of the department of Mont Blanc. It was restored in 1815, and ceded to France again in 1860. Pop. (1900) 22,000.

Chambezi, chām-bē'zī, a river of Africa, rising in the highlands south of Lake Tanganyika, about lat. 9° 40' S., and lon. 33° 15' E. Its tributaries are large, and form a considerable stream, which flows southwest to Lake Bangweolo.

Chambly, shān-blē, **Fort**, a fort situated near the rapids of the Richelieu or Chambly, at the outlet of Lake Champlain, during the time of the Revolutionary War. It was captured by the Colonists under Col. Bedel in 1775, and the colors of the Seventh Regiment of British regulars was sent to the Continental Congress as trophies of the victory.

Chambly River, a river of Canada, the same as the Richelieu (q.v.) or St. John.

Chambord, shān-bôr, **Henri Charles Ferdinand Marie Dieudonné**, dē-è-dôn-nā, COMTE DE, Duke of Bordeaux, French noble: b. Paris 29 Sept. 1820; d. Frohsdorf, Austria, 24 Aug. 1883. He was the last representative of the elder branch of the French Bourbon dynasty, and was called by his partisans Henry V. of France. He was born after the assassination of

his father, Prince Charles Ferdinand d'Artois, Duc de Berry. Charles X., after the revolutionary outbreak of 1830, abdicated in his favor; but the young count was compelled to leave the country with the royal title unrecognized by the nation. He lived successively in Scotland, Austria, Italy, and London, keeping a sort of court, and occasionally issuing manifestos. In 1846 he married the Princess Maria Theresa, eldest daughter of the Duke of Modena; and in 1851 inherited the domain of Frohsdorf, near Vienna, where for the most part he subsequently resided. While abstaining from violent attempts to seize the crown, he let slip no opportunity of urging his claims, especially after Sedan; but his belief in divine right, and his failure to recognize accomplished facts and modern tendencies, destroyed all chance of his succession.

Chambord, France, a castle, park, and village, near Blois, department of Loir-et-Cher. The splendid castle stands in the middle of a park, enclosed by walls extending eight leagues. It contains 440 rooms, 13 large staircases, and stalls for the reception of 1,200 horses. It was built in the Gothic style, by Primatice, for Francis I., and completed under Louis XIV. Here Francis I. indulged his inclination for gallantry; here the arts first sprang to life in France; and here King Stanislaus Leczinsky resided for nine years. In 1745 it was given by Louis XV. to Marshal Saxe, who died there in 1750. The Emperor Napoleon I. gave the domain of Chambord to Marshal Berthier, and in 1821 a company of Legitimists bought it and gave it to the Duke of Bordeaux, son of the Duke de Berry and grandson of Charles X.

Chambray, Georges, zhörzh shän-brä, MARQUIS DE, French general: b. Paris 1783; d. 1848. He served in the Napoleonic wars, fell into the power of the Russians, was banished to the Ukraine, and not permitted to return to France until after the fall of Napoleon. From 1823 to 1829, he filled high military positions at Vincennes and Perpignan. He wrote various works on military subjects. A second edition of his 'Philosophie de la guerre' appeared in 1835, and a 'Life of Vauban,' written by him, appeared in the 'Plutarque Français.' His most important production is his 'Histoire de l'expédition de Russie,' which appeared in 1837, and has since passed through several editions.

Chambre Ardente, shänbr är-dänt ("fiery chamber"), an apartment hung with black and lighted with tapers, in which the corpse of a person of distinction is deposited before the funeral ceremonies. The name was formerly given in France to an apartment, similarly draped and lighted, in which sentence of death, frequently by burning, was pronounced on heinous offenders. In a historical sense the term is more especially given to those extraordinary tribunals which, from the time of Francis I., directed the persecutions against heretics, and acted as a sort of inquisition. The members of the tribunal were named by the Pope. They ferreted out heretics, directed the proceedings against them, pronounced sentence, and also saw it carried into execution. A chambre ardente was established by Louis XIV. to put a stop to the numerous cases of poisoning which, after the proceedings against the Marchioness of Brinvilliers, were brought before the public. Many persons of the highest rank, among others the

Marshal of Luxemburg and Princess Louise of Savoy, were brought before this court, which, however, existed only for two years, and ceased in 1680. The last exercise of its powers was the condemnation of the celebrated sorceress, Voisin.

Chambre des Comptes, dā könt, a great court established in France prior to the Revolution, for various purposes; as for the registration of edicts, ordinances, letters patent, treaties of peace, etc. The sovereign Chambre des Comptes was held at Paris; there were also inferior courts in 10 provincial cities.

Chambre Introuvable, än-troo-vä-bl ("the chamber the like of which is not to be found again"), the term applied to the French Chamber of Deputies which met after the second return of Louis XVIII., and which by its fanatic loyalty threatened to again plunge France into anarchy and commotion.

Chameck, cha-mëk', a species of spider-monkey. See COATA; SPIDER-MONKEY.

Chameleon, ka-mël'yün or ka-më'lë-ön, lizard belonging to the family *Chamaeleontidae*. The chameleons are generally considered as constituting a sub-order or equivalent primary division of the *Lacertidae* (q.v.). All parts of their anatomy present striking peculiarities. The parietal and equamosal bones are greatly produced and meet at a common apex, thus forming a bony tripod which supports the integument of a conspicuous crest or casque on the posterior part of the head. In many species the strangeness of the physiognomy is enhanced by warts, serrated crests, and prominent spines. Trifid teeth are situated on the ridge (acrodont) of the maxillary and dentary bones, but the premaxillary is toothless. The eyelids are almost completely united, leaving only a minute circular orifice through which the animal sees, and which moves with the eyeball in its almost constant roving. More remarkable still is the well-known fact that the two eyeballs move quite independently; one may be directed at an object behind while the other views one in front. The tongue is club-shaped at the free end and slips into a sheath at the base, from which it can be projected by a complex mechanism to a distance of more than half the total length of the animal, and returns, like a bit of rubber, with great rapidity to its former position. Quite unique among lizards is the prehensile tail, which rolls downward in a flat spiral and is utilized for clinging to twigs. Serving the same purpose in the arboreal life of the animal are the almost equally peculiar feet, which have five toes arranged in two opposed sets on both fore and hind feet, but in the former the first, second, and third toes form the inner and the fourth and fifth the outer group; while on the hind feet the first and second are internal, the remaining three in the opposed outer group. Among internal peculiarities may be mentioned the lungs, which are produced into a series of long tubular diverticula, which extend to all parts of the trunk, and by means of which the chameleon is enabled to swell up its body in the fashion of a toad when angry or threatened. But the chameleon is most famous for an attribute which is by no means confined to it, but is common to many lizards and other animals. The well-known facility with which

CHAMELEON — CHAMINADE

it changes its colors is referred to. This is accomplished at the will of the animal, or results from the direct influence of external stimuli, by a relatively simple mechanism. The outer portion of the skin or epidermis is transparent; beneath this is a layer of cells filled with granules and oil-drops which appear white or yellow; among and beneath these again are large irregular chromatophores or cells filled with black and red pigment granules. These chromatophores are under the control of the nervous system, and have the power, when appropriately stimulated, of sending out long branching processes filled with pigment into the spaces between and external to the light-colored cells. When this occurs the latter cells are concealed by a pigment curtain and the animal appears dark-colored; when, on the other hand, the chromatophore processes are withdrawn, and the pigment is concentrated in the deeper layers of the skin, the animal appears pale. The rapid play of colors is due to the interchange of these two conditions in varying degrees.

Upward of 50 species of chameleons are known, belonging to the typical genus *Chameleon*, and a few others. With the exception of a few species which inhabit Arabia and India, and one whose range extends across the Mediterranean into southern Spain, all are confined to Africa, and a very large number of the strangest forms to the island of Madagascar. The common chameleon (*C. vulgaris*) is the one which inhabits the shores of the Mediterranean, and, through being so well known to Europeans, has made the peculiarities of these lizards almost proverbial.

In the United States the name chameleon is commonly applied to a lizard (*Anolis principalis*) and its allies, belonging to a quite different group. The American chameleon belongs to a genus and family *Iguanida* (q.v.) of numerous species which swarm in tropical America and the West Indies. It is probable that it has been popularly classed with its African namesake because of the equal facility with which changes of color are effected. It may be bright green, yellowish-gray, rich brown, or almost black, and the male is peculiar in having beneath the throat a pouch of elastic skin which can be inflated by means of a pair of delicate bony rods belonging to the skeleton of the tongue, when it appears of a flaming orange or vermilion color. They are dainty, smooth-bodied little animals, and are chiefly arboreal, jumping from twig to twig in pursuit of insects with an activity that contrasts strongly with the sluggishness of the European chameleon, which depends upon its projectile tongue to secure its game. *Anolis principalis* is the only member of the genus which enters the United States, and is quite common in Florida and other southern States, from which numbers were shipped to the north a few years ago to supply the requirements of a silly fashion in vogue at that time of wearing the pretty lizards secured to the dress by a tiny golden chain about its neck. Owing to the ignorance of the wearers, many of the chameleons quickly succumbed to thirst, as they, in common with most lizards, require a constant supply of water.

Chameleon, a southern constellation containing nine stars, lying within the Antarctic polar circle.

Chameleon Mineral, manganate of potassium, so called because a solution of it changes from green, through a succession of colors, to a rich purple.

Chamfort, shān-fôr, **Sébastien-Roch Nicolas**, French revolutionist: b. near Clermont in Auvergne 1741; d. 1794. He made his début as a litterateur under the name of Chamfort, and obtained some success as a dramatist and as a critic, which procured him a place in the French Academy, a pension, and a place at court. An independent and somewhat misanthropic spirit made him, however, in spite of his interest, favor the Revolution, of which he became the epigrammatist. He resigned his employment at court, and took the literary editorship of the 'Mercury.' He furnished Sièyes with the idea and the title of his famous pamphlet 'Qu'est-ce que le Tiers-État?' and forged such popular watch-words as: 'Guerre aux châteaux, paix aux chaumières' ('War to the castles, peace to the cottages'). He was employed by Roland in the 'National Library,' and published the first 26 'Tableaux Historiques de la Révolution.' Threatened with imprisonment, he endeavored to blow out his brains. Though not immediately fatal, the wounds he inflicted on himself ultimately put a period to his life. His poetry has now little reputation. His best work, 'Mustapha and Zangir,' at which he labored for 15 years, exhibits him as a feeble follower of Racine and Voltaire. It is praised for purity of style and mildness of sentiment; but, as a French critic pungently observes, he reserved all his mildness for his tragedies. A collection of 1,800 *bon mots*, under the title 'Chamfortiana,' is now considered the best memorial of him. In this he appears as a man to make himself feared rather than loved.

Chamier, sha-mêr', **Frederick**, English novelist: b. London 1796; d. 1870. He entered the navy at an early age, took part in the last campaigns against the French, and distinguished himself in the American war of 1812. He retired in 1833 with the rank of captain, and living at Waltham Hill, acted as a justice of the peace for the counties of Hertford and Essex. He imitated Captain Marryat in making his experience of a sea life the basis of a series of romantic tales, but did not equal him in humor and imagination. He has, however, been credited with great fidelity to nature. His principal works are: 'The Life of a Sailor' (1834); 'Ben Brace' (1835); 'The Arethusa' (1836); 'Jack Adams' (1838); 'Tom Bowline' (1839). He also published a review of the scenes witnessed by him in the revolution of 1848.

Chaminade, shā-mē-nād, **Cecile Louise Stephanie**, French musician: b. Paris 8 Aug. 1861. She studied at Paris under Le Couppey, Savard, Marsick, and Benjamin Godard; soon acquired a high reputation as a pianist, and played at concerts in Paris, Berlin, Vienna, London, Constantinople, and other cities. Her compositions, which are widely known, include 'Callirhoë,' a ballet symphony performed with great success at Marseilles (1888), Lyons (1889), and Bordeaux (1901); 'Les Amazones'; 'Ménétriers'; and a number of songs, among which are 'Madrigal'; 'Chanson Slave';

CHAMELEON.

CHAMISSO—CHAMOUNI

'Ritournelle'; 'Fleur de Matin'; and 'Sans Amour.'

Chamisso, shā-mēs'sō, **Adelbert de** (properly **LOUIS CHARLES ADELAIDE DE CHAMISSO DE BONCOURT**), German writer: b. at the castle of Boncourt, Champagne, 27 Jan. 1781; d. Berlin 21 Aug. 1838. When a boy his family were driven by the breaking out of the Revolution to seek an asylum in Berlin. On the Peace of Tilsit he returned with his family to France, and in 1810 was appointed professor in the Lyceum of Napoleonsville; but shortly after returned to Prussia, and during three years devoted himself enthusiastically to the study of natural science at Berlin. Count Romanzoff having in 1815 fitted out a vessel, under the command of Otto von Kotzebue, for the discovery of the northwest passage, Chamisso accepted the appointment of naturalist to the expedition, and added greatly to his store of scientific knowledge. He afterward took up his residence at Berlin, was appointed superintendent of the botanic garden, and received the diploma of doctor from the university for the collections in natural history which he had presented to the museum. His abilities as a naturalist are displayed in his work 'De Animalibus quibusdam e Classe Vermium Linnæi' (1819); and his 'View of the Most Useful and the Most Noxious Plants of North Germany, with Remarks on Scientific Botany.' In 1827, partly for the purpose of rebutting the charges brought against him by Kotzebue, he published 'Views and Remarks on a Voyage of Discovery,' and 'Description of a Voyage Round the World.' Both works display great accuracy and industry. His last scientific labor was a tract on the 'Language of Owyhee.' His reputation as a naturalist has been somewhat eclipsed by that which he acquired as a poet. As early as 1804-6 he, in concert with Varnhagen von Ense, published a collection of poems, under the name of the 'Muses' Almanac'; and in 1813 appeared his celebrated and most original tale, 'Peter Schlemihl,' which has been translated, among other languages, into English, and admirably illustrated by Cruikshank. His poetry is marked by vigor, correctness, and a thorough command of the German language; but is in general of a gloomy and terrific cast. He is the author, however, of several humorous pieces; and his political poems are distinguished by caustic, yet wholesome raillery. Many of his ballads and songs are masterpieces of their kind. See *Hitzig*, 'Leben und Briefe von A von Chamisso' (1839); *Fulda*, 'Chamisso und seine Zeit' (1881); *Raymond*, 'A von Chamisso als Naturforscher' (1889).

Chamois, shām-wā or shām'ī, a horned animal (*Rupicapra tragus*) classed among the goat-antelopes, and native to the mountains of middle and southern Europe from the Pyrenees to the Caucasus and Georgian Mountains, and as far east as Persia. The chamois found in the Pyrenees and in the Caucasus differ in local peculiarities from the Tyrolese, which is the race-type. This is about the size of a goat; but its neck is somewhat longer in proportion than that of the goat and is more graceful. The general color is brown; the head pale, almost yellow, with a dark marking on each cheek; the nails black. The short black horns rise straight from the forehead, and are recurved at the tip.

The chamois may be found in summer, in the highest Alpine altitudes, close to, and indeed beyond, the snow-line. In winter it seeks the forests, where it is somewhat protected. These forests furnish also a covert for the females and fawns, and supply the aromatic herbs on which the chamois feed, sometimes in considerable herds, though in the Alps, where they have been much hunted, the herds are small. The breeding season is in May and June.

The chamois is famous for its agility. It crosses easily, and without hesitation, chasms 15 feet or more in width; leaps rock walls a dozen feet high as easily as a boy vaults a low fence, and roams through mountain passes which other quadrupeds would shun,—dashing, with sudden leap, down almost perpendicular walls, and alighting on incredibly narrow ledges, with its fore feet so close to its hind feet as almost to touch. The creature is timid; and when feeding in flocks, one is always on the watch to announce danger by a peculiar whistling noise.

Chamois-hunting as a sport is almost impossible in the Alps, as the numbers have been so reduced by continuous hunting that the remaining ones are protected by law—only a few being annually at the disposal of the hunter; but, in the Carpathians and eastward the sport is not restricted; and he who possesses the mountaineering and sportsman-like qualities necessary may there stalk his game alone, or with a native guide, through dangerous mountain defiles.

Chamois leather is valuable commercially for its softness and warmth (see **LEATHER**), and the flesh is esteemed a table delicacy. The horns are used for ornamental purposes, especially in making souvenirs of Alpine tourist resorts.

Cham'omile. See **CAMOMILE**.

Chamond, St. See **ST. CHAMOND**.

Chamore'ril, a lake with apparently no outlet, in Middle Tibet, on a plateau 15,000 feet above the sea, between the upper waters of the Sutlej and the Indus. It is surrounded by mountains some 5,000 feet in height, from which it receives much water. Its length of 15 miles and width of 2½ are pretty constant. On account of its great depth it freezes only in winter.

Chamouni, shā-moo-nē, or **Chamonix**, shāmō-nē, a celebrated valley of France, in the department of Haute-Savoie, district Faucigny, in the Pennine Alps, fully 3,000 feet above sea-level. It is about 12 miles long, and only about half a mile wide; lies southwest to northeast, its east side formed by Mont Blanc and other lofty mountains of the same range, and its west side by Mont Brévent and the Aiguilles Rouges. It is traversed in its whole extent by the Arve, which leaves the valley by a narrow gorge at the southwest end, through which also passes, high above the river, the highway to Sallanches and Geneva. At its north end the valley communicates with Canton Valais by two roads and a bridle-path, the latter crossing the Col de Balme; and it may also be left by other passes, as the Col du Géant, but they are difficult and dangerous, and only suited for practised and daring pedestrians. The mountains on the west side of the valley, though attaining a height of 8,500 feet above sea-level, are not covered with snow in summer; but those on the east side, in the

CHAMP CLOS—CHAMPAGNE

range of Mont Blanc, being from 10,000 to upward of 15,000 feet high, are always snow-clad, excepting where the peaks are too perpendicular for snow to lie. From the snowy range proceed the glaciers, some of which approach close to the cultivated fields. They are very numerous, and of different sizes; but the two most important are the Glacier des Bossons and the Mer de Glace, the latter one of the largest glaciers in the Alps. From its lower extremity, called the Glacier des Bois, the meltings of the glacier flow off, in greater or less volume according to the season of the year, from under a naturally formed ice-arch, the source of the Arveyron, the name given to the stream thus formed, which is an affluent of the Arve. The lower slopes of the mountains are covered with timber, through which is frequently to be seen the devastating course taken by the avalanche. The soil is not fertile, but it is assiduously cultivated; and the inhabitants, who are gathered together in numerous villages, of which Chamouni or Le Prieuré is the chief, raise barley, oats, spelt, flax, potatoes, etc., raise cattle, and keep bees. During the winter, yarns, cloths, hats, and implements are made, and many articles of wood are carved. All the valley is famous for its scenery, which was first brought to public notice by Windham and Pococke, two Englishmen who visited it in 1741. It presents various points from which the whole mass of Mont Blanc may be seen at one view. The village of Chamouni, 39 miles east-southeast of Geneva, originated in a Benedictine priory founded about 1090. It has several hotels, and is supported mainly by visitors to the scenery of the valley. The ascent of Mont Blanc is most commonly made from this village. There is a monument to De Saussure, who did much to bring the valley before the notice of travelers. Pop. 2,435.

Champ clos shān klō (Fr. "a closed-in field or area"), formerly a place set apart for duels between those who wished to determine, in that manner, either a lawsuit or dispute of honor. This name was also given to the place set apart for tournaments.

Champ-de-Mars, shān-dè-mārs, and **Champ-de-Mai**, dè mā, the annual public assembly of the Franks. They were held originally in March and called from the place of meeting Champs-de-Mars; in the 8th century they were transferred by Pepin, the father of Charlemagne, to the month of May, and called the Champs-de-Mai. At the Champs-de-Mai, all questions relating to public affairs, such as war, peace, the enactment of laws, were decided by the majority. These assemblies were held irregularly under the Merovingians, but became more frequent and systematic under the first Carolingians. Pepin called together only the nobility and the clergy; but Charlemagne ordered that every count should bring with him 13 men from his jurisdiction, to represent the people in the General Assembly. The first descendants of Capet departed from this usage; but Philip IV., who reigned from 1285 to 1314, restored the third estate by calling together delegates from the cities.

The modern Champ-de-Mars in Paris is an extensive area, on the left bank of the Seine, which originally formed a place of exercise for the young men in the military school, and subsequently has been the scene of various public

festivals and great gatherings of people. Louis XVI. and his family took part here, in 1790, in the great Fête de la Fédération, in which the king swore to defend the new constitution; in June 1794, it was the scene of the Fête de L'Être Suprême. In 1815 Napoleon selected the Champ-de-Mars for the scene of a general assembly of the French people, at which he placed before the representatives of the nation the articles of a supplementary constitution, called the *Acte additionnel*, intended to establish the legality of his throne. It has also been the site of international expositions of 1867, 1878, 1889, and 1900. See PARIS.

Champac. See CHAMPAK.

Champagne, shān-pān-yū, or **Champaigne**, **Philippe de**, Flemish painter: b. Brussels 26 May 1602; d. Paris 12 Aug. 1674. He went to Paris at the age of 19, and worked on the decorations of the Luxembourg under Duchesne; he was later appointed court painter by Marie de Medicis. He was also a member and finally rector of the Academy of Painting and Sculpture. His coloring is excellent and his portraits possess great merit. His best pictures are at Vincennes and at Paris; among them are a portrait of himself, a portrait of Richelieu, 'The Apostle Philip,' and 'The Last Supper,' all in the Louvre.

Champagne, France, an ancient province which before the Revolution formed one of the 12 great military governments of the kingdom. The name Champagne, formerly Champaigne, is derived from the vast plains (Lat. *campus*, "a plain") which occupy the territory. Champagne was bounded on the north by Hainaut and the bishopric of Liège; on the east by the duchy of Luxembourg and Lorraine; on the south by Franche-Comté and Burgundy; and on the west by L'Orléanais, L'Isle de France, and Picardie. It forms at present the departments of the Marne, Haute Marne, Aube, Ardennes, and part of those of the Yonne, the Aisne, Seine-et-Marne, and Meuse. The land is fertile, and produces the celebrated wine called after its name. In the Middle Ages it was a countship of which Troyes was the capital, and was incorporated with France in 1361.

Champagne, shām-pān'; (Fr. *shōn-pā-nyè*), a French wine made chiefly in the department of the Marne, in the former province of Champagne. It is commonly divided into river and mountain wines (*vins de la rivière de Marne*, and *vins de la montagne de Rheims*), the former being for the most part white, the latter red. Not all of these wines are sparkling or frothing, though by the name "champagne" is generally understood such wine as has been subjected to an imperfect fermentation, and contains a quantity of carbonic acid gas, generated during the insensible fermentation in the bottle, this gas being disengaged on removing the pressure by which it was detained in solution. The briskest wines are not always the best; they are, of course, the most defective in true vinous quality, and the small portion of alcohol which they contain immediately escapes from the froth as it rises on the surface, carrying with it the aroma, and leaving the liquor that remains in the glass nearly vapid. Hence the still or the creaming or slightly sparkling Champagne wines (*vins crénants* or *demi-mousseux*), are more highly valued by connoisseurs and bring greater

CHAMPAGNY — CHAMPFLEURY

prices than the full-frothing wines (*vins grand-mousseux*). By icing these wines before they are used the tendency to effervesce is in some degree repressed; but when they are kept cool this precaution is unnecessary. In general, it may be observed that the vineyards on the banks of the Marne supply the choicest wines, and that the quality degenerates in proportion as they recede from the river. Among the white wines of Champagne the first rank is generally assigned to those of Sillery, the produce of the vineyards of Verzenay, Mailli, Raumont, etc. Of the Rheims Mountain wines those of Verzi, Verzenay, Mailli, Bouzy, and St. Basle are most esteemed; but the Clos St. Thierry furnishes perhaps the finest red champagne. The soil of the principal vineyards throughout Champagne is composed of a loose marl resting on chalk and sometimes mixed with flints. For the manufacture of the white Champagne wines black grapes are now generally used. In making the red wines the grapes are trodden before they are introduced into the vat. Champagne, when well made, and placed in cool cellars, will retain its good qualities from 10 to 20 years.

Champagny, shān-pān-yē, **Jean Baptiste Nompere** (nōn-pār) **de**, (DUKE OF CADORE), French naval officer, diplomatist and politician: b. Roanne 4 Aug. 1756; d. Paris 3 July 1834. He entered the navy in 1780, and was a member of the States-General, National, and Constituent Assemblies. Thrown into prison in 1793, he was released after the 9th Thermidor (1794), and became councillor of state. He was employed by Napoleon as ambassador to Vienna, and as minister of the interior and of foreign affairs, and he negotiated the marriage with Marie Louise. After Napoleon's downfall he transferred his allegiance to the Bourbons, under whom he became a peer.

Champaign, shām-pān', Ill., a city in Champaign County, on the Illinois Cent., the Cleveland, C. & St. L., and other R.R.'s, 48 miles southeast of Bloomington. It is the trade centre of the richest agricultural county in the State, and has also a number of manufacturing interests. It is the seat of the University of Illinois, and of the Burnham Athenæum and Hospital. Pop. (1900) 9,098.

Cham'pak, chūm'pāk, an East Indian tree (*Michelia champaca*), of the natural order *Magnoliaceae*. It has large axillary flowers of a deep yellow color, and very fragrant, which are much celebrated in Hindu poetry. The tree is sacred to Krishna, and the women of India adorn their hair with its blossoms. The bark has tonic properties.

Champaran, chūm-pā-rūn', India, a district in the province of Behar, in the northwestern part of Bengal, south of Nepal, and east of Oudh; area, 3,531 square miles. The surface is mostly a fertile plain which produces rice, grains, sugar, opium, indigo, etc. Gold is washed down by the rivers from the mountains of Nepal. The climate is very unhealthy. Pop. 1,500,000.

Champe, chāmp, **John**, American soldier: b. Loudon County, Va., 1752; d. Kentucky about 1790. He was selected by request of Washington to go to New York as a deserter and spy, and if possible to seize and bring off Arnold in time to save the life of André. Champe under-

took the enterprise with courage, passed the American lines with difficulty, was hotly pursued by his comrades as a deserter, reached New York, underwent an examination before Sir Henry Clinton, and by him was consigned to Gen. Arnold, who gave him in the British army his former rank. He discovered the custom of Arnold to walk in his garden at a late hour every night, formed a plan with a comrade to seize and gag him there, and to take him between them as a drunken companion to a boat on the Hudson, whence arrangements were made for his transportation to the American headquarters. On the appointed night Arnold failed to appear in the garden, and Champe, after waiting for him till near morning, returned with deep chagrin to his position in the British army. It proved that Arnold had the day before changed his quarters, preparatory to the embarkation of his troops for Virginia. There was nothing left for Champe but to embrace the first opportunity to escape to the American army, which he did soon after landing in Virginia, and joined the troops under Gen. Greene. Washington discharged him from further service, lest, falling into the hands of the enemy, he should be immediately put to death upon a gibbet. When subsequently Washington sought for him to reward him for his faithful and dangerous service, he learned of his recent death.

Champeaux, Guillaume de, gē-yōm dé shān-pō, French philosopher: b. Champeaux in Bré, about 1050; d. 1121. He was so called from the place of his birth. He studied at Paris under Anselme, De Laon, and Manégolde, and afterward himself opened a school there, in which he had numerous pupils. The schools opened by De Laon and Champeaux are regarded by Pasquier as the origin of the University of Paris. Among the pupils of Champeaux were Robert de Bethune, one of the most distinguished prelates of the age, and still more famous Abelard. He defended the doctrine of realism against the nominalism of Abelard; but it is only in the works of Abelard that any record of their contention remains. Champeaux has left a treatise on the origin of the soul, ('De Origine Animæ,' in which he examines the question how children dying without baptism are justly damned, which he concludes by referring to the unfathomable judgments of God. The only other work of his which has been printed is 'Moralia Abbreviata.' He founded in 1113 the abbey of St. Victor.

Cham'perty, or **Cham'party** (Lat. *campi partitio*, "a division of lands"), in law, a bargain with the plaintiff or defendant in any suit to have part of the land, debt, or other thing sued for, if the party that undertakes the suit prevails therein, the champertor carrying on the party's suit at his own expense. It is a species of maintenance, and is generally held to be illegal both in courts of common law and equity; but in some of the States of this country such agreements are recognized by law, and the tendency is toward freedom of action in these as well as other contracts. See MAINTENANCE.

Champfleury, shān-flē-rē, pseudonym of JULES FLEURY-HUSSON, French novelist and miscellaneous writer: b. Laon 10 Sept. 1821; d. Sèvres 5 Dec. 1889. His story of 'Les Chien-Cailloux' was in Victor Hugo's opinion a masterpiece of realistic description. He wrote an

CHAMPIER — CHAMPION'S HILL

autobiographical novel of his youthful years in 'The Confessions of Sylvius' (1849), continuing the story in 'The Adventures of Mariette' (1856). But his 'Burghers of Molinchart' (1855), a satiric delineation of the provincial bourgeoisie, made him famous. He is a pronounced "realist." Among his later novels 'The Tourangeau Girls' (1864), and 'The Little Rose,' are most worthy of mention. He compiled a 'General History of Caricature' (5 vols. 1865-85), with a supplementary volume, 'Secret Museum of Caricature' (1888); and several other works on the arts of design and ceramics.

Champier, shān-pē-ā, **Symphorien**, French historian: b. St. Symphorien-le-Loise, Lyonnais; d. Lyons about 1540. Famed as a physician, with powerful friends at court and an ample fortune, he took delight in literature and the society of literary men, himself writing a series of poems for 'Virtuous Ladies' (1503), in four divisions, entitled 'The Flower of Dames,' 'The Rule of Love,' 'The Prophecies of the Sibyls,' and 'The Book of True Love,' respectively. His best history is an account of 'Princes and Battles' (1502).

Champignon, shan-pē-fion, the French name for the common mushroom (*Agaricus campestris*). See AGARIC.

Cham'pion, chām-pi-ōn, one who undertakes to defend, in combat or by argument, another person, a doctrine, or a cause. In the rudest state of society men avenge their own wrongs without restraint. The first step commonly made toward a better state of things in the rude beginnings of political society is to confine this right within certain bounds, and allow it to be exercised only with certain formalities. This was done by the feudal institutions of Europe, which recognized in many circumstances, under the toleration of the Church itself, the right of private combat. In some countries, however, particularly in England, the legal recognition of the right of combat had this injurious effect, that the practice became so settled as to be allowed to continue even after more rational ideas had grown up on the subject of the administration of justice. The combat, after it had become a common means of settling disputes, was not always waged by the contending parties. This was the case, indeed, in appeals of felony, and if the heir, either from sex or age, was incapable of "waging his battle," as it was called, the question was left to a more rational mode of settlement. But in the writ of right, the last and most solemn decision respecting real property, the tenant was required to produce his champion, who threw down his glove as a challenge to the champion of the demandant, and the latter, by taking it up, accepted the challenge. The laws authorizing judicial combat, though fallen into disuse, continued to disgrace the English statute-book till 1819. Even the right to the English crown was in some degree put in issue by appeal to judicial combat; and the appearance of a champion offering battle to any one who gainsays the right of the king to the crown was till recently a part of the ceremonial of an English coronation. This office was for four centuries hereditary in the family of Dymoke, of Lincolnshire. The champion's function was to ride into Westminster Hall in full knightly armor, throw down his gauntlet, and proclaim his readiness to de-

fend the title of the sovereign to the crown against any one disputing it. The last exercise of the office was at the coronation of George IV.

The term "champion" is also used in the realm of athletics to designate one who is pre-eminent in a certain branch. More especially is it applied to the foremost boxer, wrestler, or billiard-player, or in the case of the first two sports, to the leader in his class as distinguished by weights, etc. See BOXING. Those pre-eminent in track athletics are usually said to "hold the record."

Champion's Hill, Battle of. On 30 April 1864, Gen. Grant crossed to the east side of the Mississippi River at Bruinsburg, 32 miles in a direct line below Vicksburg. On 1 May he marched to Port Gibson, defeating a Confederate force under Gen. J. S. Bowen. This turned the position at Grand Gulf, and on the 3d Grant reached Hankinson's Ferry; then, after bringing up supplies, marched northeast to interpose between the Confederates, under Gen. J. C. Pemberton, in and near Vicksburg, and those at Jackson, the capital of Mississippi, 40 miles east of Vicksburg. The battle of Raymond was fought and won on the 12th, and on the 14th Gen. Joseph E. Johnston was attacked, defeated, and driven north from Jackson, Grant occupy-

ing the place. Learning from an intercepted dispatch, one of three sent by Johnston to Pemberton, on the 13th, that Pemberton had been advised to march with all his available force on Clinton, 10 miles west of Jackson, and attack Grant's rear, while Johnston operated on his front or flank, Grant, leaving Sherman with two divisions at Jackson to destroy all public property and manufacturing establishments, turned the rest of his army from Clinton, Raymond, and Auburn, on Bolton and Edwards' Station, on the Vicksburg & Jackson R.R., the nearest points where Johnston could unite forces with Pemberton, and at night of the 15th the various divisions were near their designated positions. Pemberton, with the three divisions of C. L. Stevenson, J. S. Bowen, and W. W. Loring, was near Big Black River, on the 14th when he received one of the triplicate dispatches sent by Johnston on the 13th. Anxious to hold Vicksburg and the line of the Big Black, 13 miles east, he questioned the wisdom of acting upon Johnston's suggestion, and called a council of his leading officers, a majority of whom agreed with Johnston; but he adopted the suggestion of Loring and Stevenson, to move on Grant's rear in the direction of Raymond, and advanced on the 15th for that purpose, Loring's division halting at night on the Raymond road at Elliston's, eight miles east of Edwards' Station, the other divisions farther north on roads coming

CHAMPLAIN

into the Raymond road. Early next morning the march was resumed, but the head of column had scarcely left camp when Pemberton received a despatch from Johnston that he had been driven north from Jackson, and advising that he move directly on Clinton, and inform him of the movement, that he also might move to that point with 6,000 men. Pemberton concluded to make the movement. He immediately turned back his trains to Edwards' Station to get the road leading to Brownsville on the north, and had scarcely done so, when Osterhaus' and Smith's divisions of Grant's army made their appearance on the Raymond road and attacked his skirmishers, upon which he suspended his movement to join Johnston. Continuing the reversal of his trains to the rear, he formed for battle on the general line of a cross-road, connecting the Raymond and Clinton roads, Loring on the right, covering the Raymond road, Bowen in the centre, and Stevenson on the left, on the northern point of a narrow ridge, known as Champion's Hill, about 60 to 70 feet above the general level of the country, covering the Clinton road and the intersection of the cross-road. Stevenson formed line while heavy skirmishing was going on to his right. Pemberton had about 17,500 men. The position of Grant's army on the night of the 15th was as follows: Hovey's division was at Bolton on the Clinton road; Logan's and Crocker's were on the same road a few miles in Hovey's rear; Osterhaus' was on a cross-road half-way from Raymond to Bolton; Carr's a short distance in his rear; and the divisions of A. J. Smith and Blair were west of Raymond on the Edwards' Station road. These seven divisions numbered about 32,000 men, on the three roads converging on Edwards' Station, and known as the Raymond road on the south, the middle road, and the Clinton road on the north. Early on the morning of the 16th Grant, who was at Clinton, heard that Pemberton was marching to attack him, upon which he sent orders for McPherson, with the divisions of Logan and Crocker, to close up rapidly on Hovey, and for the four divisions under McClernand on the Raymond and middle roads to move forward cautiously and establish communications with each other. He then hastened by the Clinton road to the front. A. J. Smith, advancing on the Raymond road, attacked and drove in Loring's skirmishers about 8 o'clock, and Osterhaus on the middle road engaged those in his front, artillery was brought up and opened fire, but McClernand, who was in command of the four divisions, more than half the army on this part of the field, doubtful if Grant wanted him to bring on a general engagement, deferred attack until 2 p.m., when he received Grant's order to attack, upon which he ordered Smith and Osterhaus to attack vigorously and "press for victory," but the attack was not a vigorous one, and meanwhile the battle was being fought out and decided on the right, on Champion's Hill. Hovey, advancing on the Clinton road began skirmishing with Stevenson about 10 o'clock, and began to form line for a general attack, but was directed by Grant to wait until McClernand could be heard from. Logan came up at 11 o'clock; nothing had been heard from McClernand, and line was formed for a general attack, Hovey south of the Clinton road and Logan on his right. It was about noon when

Hovey advanced with great spirit, climbed Champion's Hill, and attacked; finally, after a hard contest with varying success, driving back the right of Stevenson and capturing 11 guns, soon after which Logan, who had worked around on Stevenson's left, on the north side of the hill, attacked and drove back Stevenson's left and captured seven guns. The positions thus gained were held until 2 o'clock. Meanwhile Stevenson, who had been compelled to take ground to the left to meet Logan's flank movement and cover the road to Baker's Creek and Edwards' Station, had induced Pemberton to draw Bowen to the left and close the interval between the two divisions, and Loring was ordered to close in on Bowen. It was after 2 o'clock when Bowen closed in on Stevenson, and his two leading brigades, F. M. Cockrell's and Green's, attacked Hovey furiously and drove him back down the hill, Hovey contesting every foot, but forced to abandon nine of the captured guns. As Hovey fell back two brigades of Crocker's division came to his support, and the Confederates were checked. Artillery was now massed, and poured such an effective enfilading fire upon Stevenson's line that it was much shaken, and Hovey and Crocker again charged up the hill, driving Stevenson and Bowen, after a desperate resistance, before them; and Pemberton, seeing his left entirely broken, at 3 o'clock gave the order for a general retreat, which he ordered Loring to cover. Before this, Loring, leaving Gen. Lloyd Tilghman's brigade on the Raymond road to oppose Smith and Blair, had already with two brigades nearly closed up on Bowen, and when the retreat began was forming his men between the Clinton and Raymond roads, when he was attacked by Osterhaus, and soon gave way, falling back to the Raymond road. Meanwhile A. J. Smith had advanced on the Raymond road, defeated and killed Tilghman. Loring reunited his command and retreated on the Raymond road, but when he came to the ford of Baker's Creek he found it in Union possession, upon which, after vain effort to find a crossing lower down, and realizing that he had been cut off from Pemberton's army, he moved off to the south, abandoning his artillery, and on the 19th joined Johnston, who meanwhile had re-occupied Jackson. Stevenson's and Bowen's men retreated to the Big Black, Grant following as far as Edwards' Station, where darkness ended the pursuit. Grant says he fought the battle with about 15,000 men actually engaged, in four hours of hard fighting, preceded by two or three hours of skirmishes, some of which rose almost to the dignity of battle. The Union loss was 410 killed, 1,844 wounded, and 187 missing. The Confederate loss was 380 killed, 1,018 wounded, 2,441 missing, and 24 guns taken. Grant pursued next day, the 17th, defeated Pemberton at the Big Black, and on the 19th invested Vicksburg. Consult: 'Official Records' (Vol. XXIV.); Greene, 'The Mississippi'; Grant, 'Personal Memoirs'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. III).

E. A. CARMAN.

Champlain, shān-plān or shām-plān', **Samuel de**, French navigator, colonizer, and soldier: b. Brouage, Saintonge, about 1570; d. Quebec 25 Dec. 1635. In early life he served in the army of Henri IV., as quartermaster of

CHAMPLAIN — CHAMPNEYS

cavalry, but in January 1599 he sailed to the West Indies, Mexico, and Panama. On his return (1601) he prepared a record of this cruise, with charts, etc. In March 1603 he sailed for North America, and explored, by boat, the St. Lawrence River up to the Falls of St. Louis, and down to Gaspé. In May 1604 he sailed with De Monts along the shores of Nova Scotia, wintered on the island of St. Croix, and founded a colony at Port Royal. From 1604 to 1606 he made careful surveys and charts of the coast as far as Cape Cod. He revisited France in 1607, but sailed again in 1608, and founded Quebec, which, owing to the development of its fur-trade, rapidly increased in size. In 1609 he accompanied an Algonquin and Huron expedition against the Iroquois, and thereby discovered Lake Champlain, on the borders of which the Iroquois were defeated. From September 1609 to March 1610 he was engaged in bringing over French mechanics for his colony. He became lieutenant-governor of New France, 8 Oct. 1612; fortified Quebec in 1620; but was compelled in 1629 to surrender to an English fleet, and was taken to England. Released in 1632, he sailed again for New France, with three well-equipped vessels, and spent his last years in the government and development of the French colonies. He published '*Voyages à la Nouvelle France*' in 1632.

Champlain, shām-plān', **Lake**, a body of water chiefly in the United States, between the states of New York and Vermont, but having the north end of it within the Canadian boundary, in the province of Quebec. Its extreme length, north to south, is about 125 miles; breadth, from half a mile to 15 miles; area, about 600 square miles. It is 90 feet above the level of the sea. It was discovered in 1609 by Samuel Champlain, governor of Canada, whence its name. It is navigated by steamboats and other vessels, and is deep enough for ships of the largest class. Its waters are carried northward to the St. Lawrence by the river Richelieu or Sorel, which, in conjunction with the Chambly Canal, affords navigation for large vessels, and forms a well-frequented line of communication. The south end of the lake is connected by a canal with the Hudson River, Lake Champlain thus affording water communication between the St. Lawrence a few miles below Montreal and the Atlantic at New York. Upwards of 50 islands are scattered over its surface; and it receives numerous streams, none of which are very important. The scenery along its sides is picturesque. It abounds in salmon, shad, pike, and other fish; in winter it is usually frozen over. The chief port on its banks is Burlington, Vt. During the wars between the United States and Great Britain, this body of water was the scene of numerous military operations. On 13 Oct. 1776, Benedict Arnold engaged a vastly superior English force, and made a daring escape. On 11 Sept. 1814, the American Commodore McDonough gained, under adverse circumstances, a most brilliant and thorough victory over the English fleet, near Plattsburg. This was one of the earliest substantial successes for the United States in the War of 1812.

Champlain Summer School. See SUMMER SCHOOL.

Champlain Stage, the name given by American geologists to the subsidence that was a feature of the close of the Glacial Epoch in New York, New England, Ontario, and Quebec. At the beginning of the Glacial Epoch the elevation of this section of the continent may have been greater than now, but when the ice-sheet finally retreated the sea extended up the St. Lawrence River nearly to Lake Ontario, and the lower Ottawa River and Lake Champlain were occupied by salt water. The stage is named from the lines of old sea beaches containing whale and walrus bones, thus showing the submergence, typically developed about Lake Champlain. The total amount of the depression varied, being greatest over the St. Lawrence valley. About New York harbor the coast was depressed fully 70 feet; at Albany 355 feet. Along the Maine shore the land was 150 to nearly 300 feet lower than now, and in the St. Lawrence valley the depression was over 500 feet, making allowance for the previous elevation the total depression in the St. Lawrence valley reached 1,500 feet. The climate of Champlain time was probably warmer and moister than that of the present. On the Pacific coast are evidences of depression in the region about Mount St. Elias, shells of Champlain species being found at an altitude of 5,000 feet. See GLACIAL PERIOD; QUATERNARY PERIOD.

Champlin, chāmp'līn, **James Tift**, American educator: b. Colchester, Conn., 9 June 1811; d. Portland, Maine, 15 March 1882. He graduated valedictorian at Brown University in 1834, and was tutor there, 1835-8. He was a Baptist pastor at Portland, Maine, 1838-41; professor of Greek and Latin, Waterville (now Colby) College, 1841-58; president of the college, 1857-73; professor of intellectual and moral philosophy, 1858-73, when he removed to Portland to devote himself entirely to literary work. He published a large number of school and college text-books, including English, Greek, and Latin grammars, editions of *Æschines*' and *Demosthenes*' orations, *Tacitus*, and *Butler's* '*Analogy of Religion*.' Others are: '*Text-book of Intellectual Philosophy*' (1860); '*First Principles of Ethics*' (1862); '*Political Economy*' (1868); '*Scripture Reading Lessons*' (1876); '*Constitution of the United States*'; with *Brief Comments on the Constitutions of England and France*' (1880).

Champlin, John Denison, American author: b. Stonington, Conn., 29 Jan. 1834. He was graduated at Yale in 1856, and admitted to the bar in 1859. In 1864 he became associate editor of the '*Standard*,' at Bridgeport, Conn. He afterward published '*The Sentinel*' (1865-9) at Litchfield, Conn., and became associate editor of the '*American Encyclopædia*' (1875). He is author of '*Young Folks' Cyclopædia of Common Things*' (1879); '*Young Folks' Cyclopædia of Persons and Places*' (1880); '*Young Folks' Catechism of Common Things*' (1880); '*Young Folks' Astronomy*' (1881); '*Young Folks' History of the War for the Union*' (1881); '*Chronicle of the Coach*' (1886); '*Young Folks' Cyclopædia of Games and Sports*' with A. E. Bostwick (1890); '*Young Folks' Cyclopædia of Literature and Art*' (1901).

Champneys, chāmp'nīz, **Basil**, English architect: b. 1842. He was educated at Trinity College, Cambridge, and after studying archi-

lecture with the architect Prichard, of Llandaff, began the practice of his profession in 1867. Important works of his are the divinity and literary schools of Newnham College, and the Archæological Museum at Cambridge; Indian Institute, Robinson Tower at New College, and Mansfield College at Oxford; Rylands Library in Manchester; Butler Museum at Harrow; and Quincentenary buildings at Winchester College. He is cathedral architect at Manchester. He has published 'A Quiet Corner of England,' a delightful description of Rye and Winchelsea (1875); 'Henry Merritt: Art Criticism and Romance' (1879); 'Coventry Patmore: Memoirs and Correspondence' (1900).

Champney, chāmp'nī, Benjamin, American artist: b. New Ipswich, N. H., 20 Nov. 1817. He went to Boston in 1834, and for three years worked in a lithographic establishment. From 1841 to 1848 he studied painting in Paris and Italy, exhibiting several times in the Paris Salon. He works chiefly in landscape and flower painting, and his White Mountain paintings, which are owned in and around Boston, are famous. Since 1853 he has passed most of his summers at his cottage and studio in North Conway, N. H.

Champney, Elizabeth (WILLIAMS), American writer for young people: b. Springfield, Ohio, 6 Feb. 1850. She was married to J. W. Champney (q.v.), 15 May 1875. Many of her books are illustrated by her husband. Among them are the Vassar Girls' Series, 'Three Vassar Girls Abroad,' 'In England,' 'In South America,' etc.; 'In the Sky-Garden'; 'All Around a Palette'; 'Rosemary and Rue'; 'The Bubbling Teapot'; 'Bourbon Lilies'; 'Sebä's Tangled Web'; 'Romance of the Feudal Châteaux'; 'Fables in Astronomy'; 'Six Boys'; 'Dames and Daughters' Series.

Champney, James Wells, American artist: b. Boston, Mass., 16 July 1843; d. New York 1 May 1903. He studied in Europe under Edouard Frère, and in 1882 became a member of the National Academy. He excelled in genre pictures and portraits, and exhibited oil paintings at the Columbian World's Fair (1893), and at the Paris (1900) Exposition.

Champollion, Jean François, zhōn frānswā shan pōl yōn, LE JEUNE, French Egyptologist: b. Figeac, Lot, France, 23 Dec. 1790; d. Paris 4 March 1832. At an early age he devoted himself to the study of Hebrew, Arabic, Coptic, etc. In 1807 he read a paper before the Academy of Grenoble on the ancient Egyptian geographical names, which he endeavored to explain by the Coptic. He then went to Paris, where he continued his Oriental studies, paying particular attention to the Coptic, and endeavoring through it to find the key to the Egyptian hieroglyphics. In 1809 he became professor of history at Grenoble, but soon retired from this post and went to Paris, where he devoted himself almost exclusively to the study of Egyptian antiquities. Assisted by the trilingual inscription of the Rosetta stone he at length discovered the key to the graphic system of the Egyptians, the three elements of which—figurative, ideographic, and alphabetic—he expounded before the Institute in a series of memoirs in 1823. These were published in 1824 at the expense of the state, under the title of 'Précis du Système hiéroglyphique des anciens Égyptiens.' In 1824

he went to Italy, and investigated the collections of papyri and other Egyptian antiquities in the principal cities there. In 1826 Charles X. appointed him to superintend the new department of Egyptian antiquities in the museum of the Louvre. In 1828 M. Champollion went as director of a scientific expedition to Egypt, at the expense of the king. He was admitted a member of the Academy of Inscriptions in 1830. In 1831 the chair of Egyptian archæology was created for him in the Collège de France. His principal works are: 'Grammaire Égyptien,' and 'Dictionnaire hiéroglyphique,' both published after his death. They are indispensable to the student of hieroglyphics.

Champollion-Figeac, fē-zhāk, Jacques Joseph, French archæologist, elder brother of the preceding: b. Figeac, Lot, 5 Oct. 1778; d. 9 May 1867. He completed his studies at Grenoble, published his first archæological memoirs in 1803, and was named successively librarian of Grenoble, professor of Greek literature, secretary and dean of the Faculty of Letters of the same town. He took an active part in everything connected with science and letters in the department of the Isère. He acted as secretary to Napoleon in drawing up under his instruction the account of his memorable passage from Elba to Grenoble. In 1828 a place was made for him as keeper of the manuscripts in the Royal Library, and shortly afterward he was installed in the chair of paleography in the École des Chartes. He was made an officer of the Legion of Honor in 1866. His principal works are: 'Antiquités de Grenoble' (1807); 'Paléographie Universelle'; 'Annales des Lagides' (1819); 'Traité élémentaire d'Archéologie' (1843); 'Écriture démotique Égyptienne' (1843); 'L'Égypte Ancienne' (1850); besides several other interesting works on Oriental history, and on the language and antiquities of the department of the Isère.

Champs-Elysees, shānz-ā-lē-zā (Fr. "Elysian Fields"), an avenue in Paris, with its surrounding gardens. It extends from the Place de la Concorde to the Place de l'Etoile, a distance of one and a quarter miles, and is a famous public resort and promenade. It became the property of the crown in 1616 and was ceded to the city in 1828.

Chanca, chān'ka, Dr. (believed to have been DIEGO ALVAREZ CHANCA), Spanish physician: b. Seville; who became a companion of Columbus on his second voyage in 1493. One of the principal authorities for this voyage is the letter which he wrote to the Catholic college at Seville, giving an account of his journey. No record has been kept of his subsequent life.

Chance, Sir William, English writer on sociology: b. 1853. He was educated at Harrow and Trinity College, Cambridge, and has been honorary secretary of the Central Poor Law Conference since 1893. He has published 'The Housing of the Working Classes of London' (1895); 'Children Under the Poor Law' (1897); 'Our Treatment of the Poor' (1899).

Chance, in its original and strict meaning, may be defined as that which determines the course of events in the absence of law, ordinary causation, or Providence. Strictly speaking, it is an idea which few men would now be disposed to admit as corresponding to anything

CHANCE ACQUAINTANCE — CHANCELLOR

which really exists; the religious mind excluding it as inconsistent with the belief in the divine government, and the philosophical mind rejecting it as inconsistent with a recognition of universal laws of causation. As a word, however, it has always been, and always will be popularly accepted as a term denoting an unknown cause, or a cause so remote that it is overlooked when events are considered superficially and apart from their universal connection.

Chance Acquaintance, A, a story by William Dean Howells, published in 1873. This agreeable and entertaining sketch contains many charming descriptions of the picturesque scenery and places about Quebec.

Chance, Games of. See GAMBLING.

Chance'-Medley, homicide happening either in self-defense, on a sudden quarrel, or in the commission of an unlawful act without any deliberate intention of doing mischief.

Chancel, that portion of a church occupied by the clergy, and often separated from the nave and aisles by screens of carved stone or oak. The screen separating the chancel from the nave is called the rood screen, because anciently a rood or large crucifix was usually placed on it, accompanied with two figures representing Saint John and the Virgin Mary. In the chancel were situated the high altar, the sedilia, or seats for the officiating clergy, and the piscina, in which the water used for washing the hands of the celebrant was poured. It usually contains carved seats or stalls, occupied by the clergy not engaged in the services. These are usually enriched with carvings, and have canopies of carved oak. The chancel occupies the same place with the apsis in the ancient basilicas, and was called so from the *cancelli* or rails used in the early churches to separate the clergy from the laity. The chancel is always at the east end of the church (churches being technically considered as having their major axes extending east and west), and is often constructionally a separate building opening from the nave with a lower roof elevation and raised several steps above the nave. In architecture the term is often employed as synonymous with choir (q.v.).

Chan'cellor, Charles Williams, American physician: b. Spottsylvania County, Va., 19 Feb. 1833. He studied at Georgetown College, and the University of Virginia, 1848-52, and was graduated at Jefferson Medical College, Philadelphia, 1853. During the Civil War he was medical director of Gen. Pickett's division in the Confederate army, 1863-5. He was professor of surgery in and dean of Washington University, Baltimore, 1868-75; secretary of the Maryland State board of health, 1875; president of the Maryland State Insane Asylum, 1880; and United States consul at Havre, France, 1893-7. Among his numerous reports and articles on medical and sanitary topics are the following: 'Report upon the Condition of the Prisons, Reformatories, and Charitable Institutions of Maryland' (1875); 'Contagious and Infectious Diseases' (1878); 'Mineral Waters and Seaside Resorts' (1883); 'Drainage of the Marsh Lands of Maryland' (1884); 'Heredity' (1886); 'Sewerage of Cities' (1886); 'Climate of the Eastern Shore of Maryland.'

Chancellor, Richard, English navigator: d. 10 Nov. 1556. He seems to have been brought up in the household of the father of Sir Philip Sidney, and was chosen in 1553 as captain of the *Bonaventure* and pilot-general of Sir Hugh Willoughby's expedition in search of a northeast passage to India. The ships were parted in a storm off the Lofoden Islands, and Chancellor, after waiting seven days at Vardöhus, the rendezvous agreed upon, proceeded alone into the White Sea, and traveled thence overland to the court at Moscow, where he was very hospitably treated, and was able to conclude a treaty giving freedom of trade to English ships. His interesting account of Russia was published in Hakluyt's 'Navigations.' Next spring Chancellor rejoined his ship and returned to England, where his hopeful reports led to the establishment soon after of the Muscovy Company. In the summer of 1555 he made a second voyage in the *Bonaventure* to the White Sea, and was at Moscow once more in the succeeding winter. In July 1556, he set sail on his voyage homeward, but was lost in the wreck of his ship in Aberdour Bay off the Aberdeenshire coast.

Chan'cellor, an officer supposed to have been originally a notary or scribe, under the emperors, and named *cancellarius*, because he sat behind a lattice, called, in Latin, *cancelli*, to avoid being crowded by the people. There are, however, other derivations of this title. Whatever may have been its origin, the office and name of chancellor were undoubtedly known at the court of the Roman emperors, where the title seems to have signified originally a chief scribe or secretary, who was afterward invested with several judicial powers, and with superintendence over the other officers of the empire. From the Roman empire the title and office passed to the Roman Catholic Church, and hence every bishop has to this day his chancellor, the principal judge of his consistory. When the modern kingdoms of Europe were established upon the ruins of the empire, almost every state preserved its chancellor, with different jurisdictions and dignities according to their different constitutions. In all he seems to have had the supervision of all charters, letters, and such other public instruments of the Crown as were authenticated in the most solemn manner, and therefore, when seals came into use, he had always the custody of the king's great seal. This officer has now great authority in all the countries of Europe.

The *Lord High Chancellor of Great Britain* (originally of England) is the first judicial officer of the Crown and exercises an extensive jurisdiction as head of the supreme court of judicature. He ranks as first lay person of the state after the blood-royal. He is always one of the commissioners appointed to represent the sovereign in opening and closing Parliament or giving the royal assent to bills. He is created by the delivery of the great seal into his custody. In like manner the act of taking away the seal by the sovereign formally determines his office. He is a cabinet minister and a privy counselor in virtue of his office, is speaker of the House of Lords by prescription, and vacates his office with the ministry which appoints him. He has a salary of £10,000. He has the appointment of all justices of the peace in the

CHANCELLORSVILLE

kingdom, is visitor, in the king's right, of all royal foundations, and patron of all Crown livings under the value of 20 marks in the king's books. The office having in early times been always filled by ecclesiastics (for no others were then capable of an employment requiring so much writing), he became keeper of the king's conscience; and by special appointment he now exercises a general superintendence as guardian over all infants, idiots, and lunatics, though these latter powers are not necessarily attendant on his office, as Blackstone seems to have imagined, but can be delegated by the Crown to any other judicial officer, as in fact they were delegated even as late as the reign of James I., when the seals were held by Dr. Williams, then dean of Westminster, and afterward bishop of Lincoln. The great seal has been not unfrequently put in commission, and was last so on the resignation of Lord Thurlow in the year 1793. One vice-chancellor was appointed to preside in the courts of equity by 53 George III., c. 24, and two by 5 Vict. c. 5, § 19. The two last-mentioned were at first subordinate vice-chancellors, but they were afterward all made of equal rank. They sat in separate courts, and an appeal lay from their decisions to the lord chancellor. They latterly sat in the chancery division of the supreme court of judicature. See CHANCERY; SUPREME COURT OF JUDICATURE.

Chancellors of Ireland and Scotland.—There is a lord high chancellor of Ireland, who is the head of the judicial bench, with a salary of £8,000. He is not a member of the British ministry. The chancellorship of Scotland was abolished at the union. The Scottish chancellor had no independent jurisdiction in equity, as there has never been a separate court of equity in Scotland; but he presided in Parliament, and was head of all the courts of judicature, and of the Scottish office of chancery, in which all charters and other writs appointed to pass the great seal were recorded. This office still exists under a director of chancery.

The *Chancellor of the Exchequer* is the principal finance minister of the government, and as all questions of supply originate in the House of Commons, a peer cannot be conveniently appointed to this office. When the first lord commissioner of the treasury is a commoner, the two offices have sometimes been united.

The *Chancellor of the Duchy of Lancaster* presides in the court of the duchy chamber, to decide questions relating to lands holden of the king as Duke of Lancaster; but it does not appear that this is a court of record. The chancellorship is generally bestowed during pleasure, though there are two instances of its being granted for life; the last being that of the celebrated Lord Ashburton. The Chancellor of the Duchy of Lancaster is a cabinet minister.

The *Chancellor of a University* is an official at the head of the university, generally a man of rank, whose duties are more or less nominal, but who is regarded as conferring the degrees. At Oxford his duties are almost entirely discharged by the vice-chancellor; the chancellor's own acts being limited to the signing of diplomas, etc. Under the vice-chancellor are four pro-vice-chancellors, nominated by him from among the heads of colleges, to one of whom, in his absence from the university, he delegates his authority. The chancellor of Cambridge Uni-

versity, whose duties are very similar to those of the Oxford official, is elected biennially by the Senate; but there is no instance, at least in modern times, where a re-election has not taken place.

Chancellor of the Order of the Garter and Other Military Orders, an officer who seals the commissions and the mandates of the chapter and assembly of the knights of the order, keeps the register of their proceedings, and delivers their acts under the seal of their order. The title "chancellor" is given, in England, to several officers of other bodies.

Chancellors of Other European Countries.—The chancellor was one of the highest officers in the German states, and by the influence of his office was one of the most important. In Germany this dignity was from the remotest times vested in one of the higher clergy, until the head of the German clergy, the Archbishop and Elector of Mainz, united it forever with his office as Arch-chancellor of the empire. The two other spiritual electors held the same dignity, but it was merely titular; the Archbishop of Cologne, as Arch-chancellor of Italy; the Archbishop of Trèves, as Arch-chancellor of Gaul and Arles, that is, the kingdom of Burgundy, once belonging to Germany. The Arch-chancellorship of Mainz, on the contrary, had important duties attached to it—the direction of the Diet and of the public business, as well as of all the imperial chanceries. The Elector appointed a vice-chancellor, who was the actual minister of the empire at the imperial court. In the new German Empire the chancellor (*Reichskanzler*) is the president of the Federal Council (*Bundesrath*), and has the general conduct of the imperial administration. All laws of the empire, after being sanctioned by the emperor, must be countersigned when promulgated by the chancellor.

The Chancellor of France was the highest officer of state, and the only one who, when once appointed, could not be dismissed. In case, therefore, it was desired to remove him from participation in affairs, a keeper of the seals (*garde des sceaux*) was appointed. As the chancellor was properly the minister of justice, he was chosen from the body of jurists. A relic of his spiritual character was, that all his furniture, liveries, and even his coach, were black.

Chan'cellorsville, Battle of. The Chancellorsville campaign included the battle of Chancellorsville, 1-3 May 1863, the action at Marye's Heights, 3 May 1863, and the engagement at Salem Church, 3 and 4 May 1863. In the fore part of April 1863 the Army of the Potomac, under Gen. Hooker, and the Army of Northern Virginia, Gen. Lee, confronted each other on opposite sides of the Rappahannock at Fredericksburg. Lee was so strongly entrenched on the south side of the river from Port Royal on the right to Banks' Ford on the left, a distance of 25 miles, that an attack on his front was not to be thought of, and Hooker concluded to march his cavalry far beyond and around Lee's left, destroy his communications with Richmond, and compel him to leave Fredericksburg, when he proposed to fall on his flank and rear as he fell back. For this purpose Gen. Stoneman with 10,000 cavalry was put in motion, 13 April, under orders to ascend

CHANCELLORSVILLE

the Rappahannock, cross it west of the Orange & Alexandria R.R., attack Lee's cavalry wherever found, and plant himself firmly across his line of retreat. Stoneman found the Rappahannock and other streams so swollen by heavy rains that he was compelled to abandon the movement, and Hooker modified his plans. He determined to flank Lee's position and compel him to come out and fight on open ground of Hooker's own choosing. Lee had, in and around Fredericksburg, exclusive of cavalry, about 60,000 men and 170 guns; the two divisions of McLaws and R. H. Anderson of Longstreet's corps, and Jackson, with the divisions of A. P. Hill and D. H. Hill, commanded by R. E. Rodes; Trimble, commanded by R. E. Colston and J. A. Early. Hooker had, not including his 12,000 cavalry, about 118,000 men and 380 guns, divided into seven corps: First, Gen. J. F. Reynolds; Second, D. N. Couch; Third, D. E. Sickles; Fifth, Geo. G. Meade; Sixth, John Sedgwick; Eleventh, O. O. Howard; Twelfth, H. W. Slocum. Both armies were in the best of condition. On the 27th the Eleventh and Twelfth corps marched for Kelly's Ford, 25 miles up the Rappahannock, arriving on the 28th, and being joined by the Fifth corps, all crossed the river next morning, the Eleventh and Twelfth corps marching for Germanna Ford on the Rapidan, the Fifth corps for Ely's Ford, lower down the same stream. Pleasanton's cavalry brigade accompanied the two columns. Some opposition was met at the fords, and at 2 P.M. of the 30th, after some sharp encounters with Stuart's cavalry, on the Germanna road, the three corps united at Chancellorsville, 11 miles west of Fredericksburg, and were joined the same day by two divisions of the Second corps, under Couch, which had crossed the Rappahannock at United States Ford, the Third corps also being near. The cavalry was thrown out on the roads toward Fredericksburg and Spottsylvania. Hooker had concentrated with great ability 71,000 men on Lee's left and joined them before night. Mahone's and Posey's brigades of Anderson's Confederate division had been guarding United States Ford; the passage at Germanna Ford turned this position, and the two brigades on the 29th fell back to Chancellorsville, where Anderson had come up with Wright's brigade. Next morning Anderson fell back with the three brigades to near Tabernacle Church, four miles, and began to throw up works covering the roads converging at that point. These movements on Lee's left were covered by demonstrations on his right and front below Fredericksburg. They began as early as the 21st, and on the 29th Sedgwick, with the First, Third, and Sixth corps, moved to points two to four miles below town, threw pontoon bridges across the river, and crossed troops to hold them. On the 30th he was ordered to demonstrate on Lee's right down the river, and the Third corps marched by the north bank of the river for Chancellorsville. Sedgwick's movements did not deceive Lee. On the afternoon of the 29th Stuart had informed him that heavy Union columns were marching for the Rapidan, and he ordered Anderson to march with Wright's brigade to Chancellorsville. When informed that Hooker had crossed the Rapidan he ordered McLaws, leaving Barksdale's brigade on Marye's Heights, to march with three brigades, at midnight of the 30th, and take posi-

tion on Anderson's right. Jackson was ordered with three divisions to Chancellorsville, leaving Early's division with Barksdale's brigade—in all, about 8,500 men, and 30 guns—to hold the lines at Fredericksburg against Sedgwick. McLaws arrived on Anderson's right about daylight, and was joined by two of Anderson's brigades from near Banks' Ford. Jackson marched at 3 o'clock on the morning of 1 May, and came up to Anderson at Tabernacle Church at 8, suspended work on the entrenchments and, at 11 o'clock, ordered McLaws and Anderson forward on the two roads leading to Chancellorsville, his own three divisions following Anderson. Three roads lead from Chancellorsville to Fredericksburg, the most direct, the old turnpike, passing Salem Church. The second, the plank road, led south from Chancellorsville, then east, uniting with the turnpike beyond Tabernacle Church. Both these roads were covered by Anderson's works. The third road led northeastward, passed Banks' Ford, about six miles distant, and continued to Fredericksburg. It was 11 o'clock, 1 May, when Meade pushed out two divisions on the Banks' Ford road and one, Sykes', on the turnpike, under orders to

be at or near Banks' Ford at 2 P.M., and at the same hour, 11 A.M., Slocum advanced on the plank road, to be at Tabernacle Church at noon, Hooker's intention being to get out of the Wilderness, uncover Banks' Ford, and form for battle in open, elevated country, his right at Tabernacle Church, his left covering Banks' Ford. Meade's left divisions had come in sight of Banks' Ford; Sykes, supported by Hancock's division, Second corps, had encountered McLaws and driven him back nearly to Anderson's works; Slocum, over two miles out, had met Jackson and was sharply skirmishing with him; and all was going well, when Hooker, impressed by the unexpected advance of the enemy, and fearing his own inability to get entirely out of the tangled forest, onto open ground, before being beaten in detail, ordered the columns back to Chancellorsville, thereby giving up the advantage of position practically gained and losing the confidence of his corps commanders. Jackson and McLaws followed the retreating troops and felt the lines with skirmishers, and McLaws got guns in position and cannonaded the left of the line. Hooker's line,

CHANCELLORSVILLE

as completed on the morning of the 2d, extended from the Rappahannock on the left to a point on the Germanna plank road full two and a half miles west of Chancellorsville. The Fifth corps and a division of the second was on the left, facing east, the right in advance of the Chancellor House. The Twelfth corps was south of the plank road, its left less than one fourth of a mile in front of the Chancellor House, its right near Hazel Grove, a little over a mile southwest of Chancellor's. Birney's division of the Third corps was on the right of the Twelfth, and the Eleventh corps continued the line from Dowdall's tavern westward beyond Talley's farm. The works held by the Twelfth, Third, and Eleventh corps faced south, those of the Twelfth in form of a bow, the plank road being the string of the bow; those of the Eleventh ran in a straight line generally just south of the road. For nearly the entire distance the line ran through an almost impenetrable forest of scrub-oak and pine. There was a spacious clearing around the Chancellor House, where Hooker had his headquarters, and open ground around Dowdall's. A division of the Second corps and two of the Third were in reserve. Pleasanton's cavalry was near

Chancellor's House. On the evening of 1 May Lee had a conference with Jackson. To attack Hooker's 71,000 men, behind works, with 48,000, was certain to entail a terrible loss of life, and it was determined that Jackson, with nearly 30,000 men, infantry, cavalry, and artillery, should march across Hooker's front and assail his right flank and rear, Lee remaining with McLaws' and Anderson's 18,000 men to watch his left, demonstrate on it, and guard the roads to Fredericksburg. Jackson moved on the morning of the 2d with his accustomed celerity, and about 4.30 P.M. his head of column was on Hooker's right and rear, and he began to form line a scant mile from the right flank of the Eleventh corps. His movement had been discovered and misunderstood. As early as 9 o'clock he was seen marching a mile or so to the south; information of the fact was sent to Slocum and Howard, and instructions to both to strengthen their flanks. Hooker soon came to the conclusion that Lee was retreating, and about 1 P.M. Sickles, at his own request, was ordered to take two divisions of the Third corps, move out and attack, which he did, falling on Jackson's rear at Welford's Furnace, taking some prisoners. Barlow's brigade of the Eleventh corps was sent to Sickles, and Pleasanton's cavalry joined him, but the forest was too dense for cavalry operations, and Pleas-

anton withdrew two of his regiments and battery to Hazel Grove, where Sickles had left some of his artillery. Williams' division of the Twelfth corps was sent from its works to form on Sickles' left, attack Anderson's left and roll him back on Chancellorsville. Williams was about to attack when Jackson fell on the flank of the Eleventh corps, and he went back to his works. The Eleventh corps was badly posted and, though repeatedly informed by brigade and regimental commanders and picket officers of the gathering enemy on the flank, the superior officers, with one exception, lulled into security by the pleasing reports that Jackson was retreating, made no adequate provision against a flank attack, and most of the men were preparing supper when the storm broke. Jackson had formed his 26,000 infantry in three lines across the plank road, a mile on either side of it, artillery in the road, and a little after 5 o'clock gave the order to advance. The lines advanced with a rush, startling the game in the forest. The Union skirmishers were quickly driven in, and with a wild yell the main Confederate line struck the right brigade of Devens' division, flanked it, and after two or three rounds had been fired it gave way, the enemy following, striking and flanking everything in the way. No troops in the world, so placed, could stay such an attack. Some regiments made heroic stand and fought brilliantly, but in 30 minutes Devens' division of 4,000 men, was routed and the Confederates advanced upon Schurz's division, which had changed front. Schurz held ground about 20 minutes, and then fell back upon Buschbeck's brigade, east of Dowdall's. Here Schurz rallied some of his men. Buschbeck stood three quarters of an hour, and it was after 7 o'clock, when, attacked in front and flank, he fell back in good order to Fairview, where 40 guns of the Eleventh and Twelfth corps were being massed on high ground in his rear. Howard's corps had been driven two miles in less than two hours, losing nearly 1,500 killed and wounded, and 1,000 prisoners. The force of Jackson's attack had spent itself; his two leading divisions—Rodes' and Colston's—had become inextricably mixed; the men were tired and hungry, and Jackson suspended their further advance and ordered A. P. Hill to relieve them. Meanwhile Hooker had sent Berry's division, of the Third corps, and Hays' brigade, of the Second, to the west edge of the open field north of the road; on Berry's right were some of Schurz's regiments; and Williams, desisting from his attack on Anderson, regained part of his works and formed south of the road on Berry's left, Buschbeck in his rear. This covered the road at a distance of a little over a half mile west of Chancellor's House. Sickles, when informed of Howard's disaster, fell back from Welford Furnace to Hazel Grove, and formed on Pleasanton's left. Barlow drew up in Pleasanton's rear, all close to Williams' left and front. The two Confederate lines fell back to the open ground around Dowdall's, to re-form, and A. P. Hill was brought up and his leading brigade pushed along the plank road beyond the intersection of a road leading left to White House, and United States Ford, the road to be taken by Hill to cut off Hooker's retreat. While Jackson was reconnoitering on this road, beyond his main line, skirmishing began between the opposing pickets in the woods, and as

CHANCELLORSVILLE

Jackson, with his staff and orderlies, was riding back, the mounted body was mistaken for Union cavalry, and fired into, Jackson (about 9.20 p.m.) was wounded in three places, both arms being shattered. Nearly the entire escort were also killed or wounded. Jackson died 10 May. At the sound of the firing in the woods the Union guns on Fairview opened a furious fire down the plank road, causing some confusion to the Confederate column on it. During this fire A. P. Hill, next in command, was wounded; the intended advance was suspended, and Gen. J. E. B. Stuart was sent for to take command. During the night and early morning some changes were made in the Union line by which the approaches on the right to United States Ford were covered by Reynolds' corps and part of Meade's, and the Eleventh corps took position on the extreme left vacated by Meade. At 9 p.m. Hooker, not knowing that Sedgwick's entire corps was at Fredericksburg, ordered him to cross from Falmouth and march up the south side of the river to Chancellorsville, and attack Lee's rear at daylight, 3 May, while he attacked in front. Pleasanton and Sickles were ordered to fall back from Hazel Grove at dawn. Pleasanton marched back at 4 o'clock, and Sickles was following when his rear was caught by the oncoming Confederate line. Stuart, who had assumed command of Jackson's corps, advanced at 5 o'clock, 3 May, with great impetuosity, his right attacking Sickles as his rear brigade was about retiring from Hazel Grove. The brigade was soon driven, four guns were captured, and Stuart swept on. Thirty Confederate guns were put in position at Hazel Grove which swept the open ground of Fairview and poured an enfilading fire on the right of Geary's division of the Twelfth corps, which was fighting Anderson, and at the same time Geary's left was being pounded by McLaws' guns. The battle now became fierce along the entire line of the Second, Third, and Twelfth corps. On the right Stuart's men fought French's division of the Second corps and the three divisions of the Third, taking the Union works, being driven from them, and retaking them. Williams was fighting Stuart's right, Geary of the Twelfth corps was desperately engaging Anderson, and on his left, covering Fredericksburg road, Hancock's division of the Second corps was resisting the fierce attacks of McLaws. Stuart gradually gained ground and united his right with Anderson's left near Hazel Grove. The Union ammunition began to fail, and finally, about 9 o'clock, French, of the Second corps, the Third corps, and Williams' division of the Twelfth, after frightful losses, began to fall back, and the Confederates gained the west of the Chancellor plateau and swept it with artillery. A cannon-shot struck a pillar of the Chancellor House against which Hooker was leaning. He was knocked down and stunned, and Couch, who was second in command, was instructed by Hooker to withdraw to a position, already selected, about three fourths of a mile north of the Chancellor House, and covering United States Ford. The right and centre, closely pressed, fought their way back; Geary, attacked in front, right flank, and rear, followed; Hancock followed Geary; before noon the troops were in the new position; and here the battle of Chancellorsville proper ended, for, before

Lee had completed preparations to renew his attack, he heard of the capture of Fredericksburg and Marye's Heights and the advance of Sedgwick. Suspending further operations against Hooker, he turned his attention to Sedgwick, sending McLaws' division to oppose him.

When Sedgwick received Hooker's order of 9 p.m., 2 May, to cross the river at Fredericksburg, he had already done so and was three miles below the town. It was 11 p.m. when he received the order; he had 14 miles to march before he could reach Chancellorsville; and an enemy barred the way. He had about 23,000 men. His three divisions were commanded by Gens. John Newton, W. T. H. Brooks, and A. P. Howe. Brooks was left below Fredericksburg, and Newton led the advance on the town. The night was dark; progress was slow; frequent halts being made while the skirmishers were feeling the way; it was the gray of the morning when Newton reached the rear and left of Fredericksburg; and as daylight came Marye's Heights were seen to be held by the enemy. Gibbon crossed the river from Falmouth and reported to Sedgwick with his division, and under cover of a demonstration by Newton, advanced on the right to turn the position, but was stopped by the canal and a concentrated fire of artillery. He found also that Hays' brigade of Early's division, and Wilcox's of Anderson's were in his front, and he was obliged to fall back. On the other flank Howe's division failed to make an impression. Nothing remained but to assault the heights, and storming columns were formed, Howe forming three on the left, and Newton, two, of two regiments each, strongly supported. These were launched against the Confederate position, and were bloodily repulsed by Barksdale's brigade. The assault was renewed and Marye's Heights carried about 11 o'clock, with a loss to Sedgwick of nearly 1,000 killed, wounded, and missing, in a very few minutes. He took 15 guns and nearly 1,000 prisoners. Here a delay occurred to get Brooks' division up, which was to take the advance, and it was 3 o'clock before Sedgwick marched for Chancellorsville, leaving Gibbon to hold the town and cover the bridges there. His march was impeded by Wilcox, who had regained the road in his front and made a stand half a mile in advance of Salem Church, where McLaws had now come up and formed across the road. Brooks' division advanced and Wilcox fell back to the church, Brooks closely following, and a desperate encounter raged around the church, in which at first Brooks, supported by Newton, was successful, but was finally compelled to fall back after losing 1,500 men. Dispositions were made to renew the struggle, but night came and both sides slept on their arms. Early, who had concentrated his command at Cox's, on the telegraph road, south of Fredericksburg, had Lee's permission to attack Marye's Heights and Sedgwick's rear at daylight. He was joined by Barksdale and, as Marye's Heights were held by a small Union force, his attack succeeded. Leaving Barksdale to hold the heights and prevent an advance of Gibbon, who was in the town, Early moved toward Salem Church and asked McLaws to co-operate with him. Meanwhile Lee, retaining only Jackson's three depleted divisions to confront Hooker at Chancellorsville, led Anderson to unite with McLaws and Early, and drive

CHANCERY

Sedgwick across the Rappahannock, the three divisions aggregating about 21,000 men. Anderson arrived about noon of the 4th, and took position between McLaws and Early. Sedgwick was now hemmed in on three sides, his line in shape of a horseshoe, both flanks on the river covering Banks' Ford. The line was five or six miles in length, Newton, on the right, facing McLaws on the west; Brooks, in the centre, facing south, confronting Anderson, and Howe, on the left, facing east, opposing Early. Skirmishing was kept up during the day, and at 6 o'clock, Lee, after reconnoitering the position, ordered an attack to break the centre. Newton was not seriously attacked, but Howe and Brooks were assailed with great spirit, Early, falling upon the former and endeavoring to turn his left, in which he did not succeed, two of his brigades being repulsed and thrown into confusion by Howe's artillery. An attack on Howe's right and Brooks' left was also repulsed. The Confederates continued the contest until darkness put an end to it. Sedgwick then withdrew from the field to Banks' Ford, where he was covered by 34 guns on the north side of the river, but he had lost so heavily and was hemmed in so closely that, with Hooker's approval, he crossed the river during the night, taking with him nine captured guns and about 1,400 prisoners. His loss, since crossing the river on the 2d, had been 3,200 killed and wounded and 1,500 captured. During the night Gibbon recrossed the river to Palmyra, and on the morning of the 5th Lee was again in full possession of the south side of the river below Chancellorsville. Early was left to hold Fredericksburg, and Lee marched back with McLaws and Anderson to renew the battle with Hooker. A heavy storm came up, converting dry ravines into torrents and the soil to deep mire, and the attack was deferred until next morning. When day came Hooker had recrossed the river at United States Ford, and the Army of the Potomac marched to its old camp, and Lee returned to his old position at Fredericksburg. The Union loss at Chancellorsville was 1,082 killed, 6,849 wounded, and 4,214 missing. Including the losses at Fredericksburg, Marye's Heights, and Salem Church, the Union loss in the entire campaign, 27 April to 5 May, was 1,606 killed, 9,762 wounded, and 5,919 missing; an aggregate of 17,287. The Confederate loss during the campaign was 1,665 killed, 9,081 wounded, and 2,018 captured; an aggregate of 12,764. Consult: 'Official Records,' Vol. XXV.; Hotchkiss and Allan, 'Chancellorsville'; Abner Doubleday, 'Chancellorsville and Gettysburg'; S. P. Bates, 'The Battle of Chancellorsville'; T. A. Dodge, 'The Campaign of Chancellorsville'; A. C. Hamlin, 'The Battle of Chancellorsville'; The Century Company's 'Battles and Leaders of the Civil War,' Vol. III.

E. A. CARMAN.

Chancery, formerly the highest court of justice for England and Ireland. It obtained its name from being under the presidency of the lord chancellor. It embraced six superior courts called high courts of chancery, and numerous inferior courts. The superior courts were the court of the lord high chancellor, the court of the master of the rolls; the court of appeal in chancery, constituted by the lord chancellor sit-

ting along with either of the two lords justices in appeal or by the two lords justices sitting together apart from the lord chancellor; and the courts of the three vice-chancellors. The ordinary legal jurisdiction of chancery embraced the issuing of writs for a new Parliament; of pleas of *scire facias* to repeal letters patent, and of all original writs. There was also a jurisdiction acquired by statute or special delegation in issuing writs of habeas corpus and inquiring into charitable uses. There were numerous other powers conferred by act of Parliament, and the lord chancellor, together with the lords justices of appeal, had exclusive authority over the persons and property of idiots and lunatics. Appeals in bankruptcy were heard by the court of appeal in chancery. The sittings and business of this court of appeal were regulated by the lord chancellor.

The procedure of the court of chancery at one time, by reason of its traditions and forms (commonly known as "red tape") became so cumbersome as partially to defeat its own ostensible aims, and rendered reform imperative. Charles Dickens made a determined attack upon the delays of chancery practice in his 'Bleak House,' and subsequent changes have been commonly attributed to his influence.

The English court of chancery is now a division of the high court of justice, which is itself one of the two departments of the supreme court of judicature (q.v.). The present judges of chancery, as a division of the high court of justice, are the lord chancellor, who presides over the division, and five justices, each of whom has the title of "Sir" and receives a salary of £5,000. According to the provisions of the act by which the supreme court of judicature was established, there were to be no more judges appointed than were already connected with the court; and the distribution of business, both as to its commencement and its transfer, was made subject to rules of court and orders of transfer. By the operation of these provisions chancery, like the other divisions of the court to which it now belongs, was gradually to cease to be a separate department; but in the meanwhile, subject to these rules and orders, certain causes and matters were assigned to chancery until these provisions should take their full effect. These are enumerated in the Supreme Court of Judicature Act (36 & 37 Vict. c. 66, § 34), and are (1) all causes and matters pending in the high court of chancery at the commencement of the act (finally fixed for 1 Nov. 1875); (2) all causes and matters to be commenced after the commencement of the act under any act of Parliament by which exclusive jurisdiction in respect to such causes or matters has been given to the court of chancery, or to any judges or judge thereof, except appeals from county courts; (3) all causes and matters for the administration of the estates of deceased persons; for the dissolution of partnerships or the taking of partnership or other accounts; for the redemption or foreclosure of mortgages; for the raising of portions or other charges on land; for the sale and distribution of the proceeds of property subject to any lien or charge; for the execution of trusts, charitable or private; for the rectification or setting aside or cancellation of deeds or other written instruments; for the specific performance of contracts between vendors and purchasers of real estates, including

CHANCRE — CHANDLER

contracts for leases; for the partition and sale of real estates; for the wardship of infants and the care of infants' estates. Chancery, as a division of the high court of justice, has no exclusive right to the administration of equity, the act already mentioned making provision under certain rules for the concurrent administration of law and equity in all the divisions of the supreme court of judicature. The court of appeal in chancery no longer exists, and its functions are transferred to the court of appeal, which in the new supreme court of judicature is the complementary department to the high court of justice. The affairs of lunatics are still under the supervision of the lord chancellor.

In the United States the general tendency has been likewise to abolish courts of chancery as separate departments, and equity jurisdiction is generally conferred on the courts of law. Delaware, New Jersey, and Tennessee are among the few States that still retain the former practice.

Chancre, shānk'ēr, two forms of venereal disease which go by this name: hard chancre, the initial lesion of syphilis (q.v.); and soft chancre, or chancroid (q.v.).

Chancroid, shānk-roid, a contagious venereal disease characterized by the presence of one or more, often several, suppurative ulcers, chiefly located in the genital regions. These are due to infection by the organisms of dirt and are not true syphilitic lesions. Very frequently both hard and soft chancres are communicated at the same time, but they can be distinguished, although it has been only within the last 50 years that a definite line has been drawn between these two varieties of venereal disease. Chancroid is definitely a dirt disease, and is due to uncleanness as well, perhaps, as to a specific micro-organism. Chancroid usually develops, within 24 to 48 hours after infection, as a minute macule, or pin-point vesico-pustule surrounded by a reddish halo. This increases day by day until a pustule or ulcer about the size of a small coin is developed. This ulcer is usually a soft ulcer. There is not much induration in the connective tissue beneath it, which is one of the distinguishing features between it and true syphilitic chancre. Chancroids are usually multiple, whereas chancres are usually single. They persist usually from three to six weeks and are often very difficult to cure, and furthermore a patient with chancroid may reinfect himself and thus spread the lesion at times very widely.

Chanda, chūn'dā or chan'dā, India, chief town of the district of Chanda in the Nagpur division of the Central Provinces. It is surrounded by a stone wall five and a half miles in circuit, inside which are cultivated fields and detached villages, while there are also suburban quarters outside. There is a citadel now inclosing the jail, tomb of the Gond kings, three interesting temples, massive monoliths, etc. The town has a public park, civil station, and military cantonments. The manufactures include cottons, silks, brass utensils, etc. There is an annual fair beginning in April and lasting three weeks. Pop. 16,000.

Chandausi, chūn- or chān-dow-sē', India, a town in the Northwestern Provinces, 27 miles south of Moradabad. It is the centre of a

considerable trade, especially in sugar and cotton, and has limestone quarries. Pop. 29,000.

Chandeleur (shān-dè-lër) Islands lie east of Chandeleur bay, on the southeast coast of Louisiana. On the northern or smaller island is a fixed white light.

Chanderi, chūn- or chān-da'rē, or **Chandhairee**, India, a town of Scindia's Dominions (Gwalior), Central India, 105 miles south of the town of Gwalior. It contains many ruins showing its former greatness and magnificence, but is now an insignificant place. The fort, which figures much in the wars of the Mogul dynasty, is on a hill, enclosed by a stone rampart, flanked with circular towers. Pop. 6,000.

Chandernagor, chūn-dēr-nū'gōr or chān-der-na'gōr, or **Chandarnagar**, India, a town on the right bank of the Hooghly, 16 miles north-northwest of Calcutta. Its only manufacture is of cotton cloth, and there is no trade but with Calcutta. The French established a factory there in 1676, and in 1688 obtained a formal cession of it, together with its territory of about three and a half square miles, from Aurungzebe. It was three times taken by the British, first in 1757, but finally restored to the French in 1816. Chandernagor is under a sub-governor, subordinate to the governor of Pondicherry. Pop. of town and territory 26,000.

Chand'ler, Abiel, American merchant: b. Concord, N. H., 1778; d. Walpole, N. H., 22 March 1851. He was graduated at Harvard College in 1806, and was for many years a merchant in Boston. He died a widower, without children, and devised \$50,000 to Dartmouth College. The Chandler School of Science at Dartmouth was established in 1851 in pursuance of this bequest. For many years it was maintained as a separate department, but has recently been formally incorporated into the college and it is now known as the Chandler scientific course leading to the degree of bachelor of science.

Chandler, Charles Frederick, American chemist: b. Lancaster, Mass., 6 Dec. 1836. He studied at the Lawrence Scientific School of Harvard College, and at the universities of Berlin and Göttingen, receiving his doctor's degree at the latter in 1856. He was professor of chemistry in Union College, 1857-64, and professor of analytical and applied chemistry in the Columbia College School of Mines, 1864-1903. In 1858 he was elected to the chair of chemistry in the New York College of Pharmacy, and in 1876 to the chair of chemistry and medical jurisprudence in the College of Physicians and Surgeons. He became chemist to the Metropolitan Board of Health in 1865, and its president in 1873, being instrumental in securing great reforms in connection with the sanitary condition of the markets and the purity of the food-supply, notably in the case of milk. He is a member of the chemical societies of Berlin, London, and Paris, and of the National Academy of Sciences. With his brother, Prof. W. H. Chandler, he founded the 'American Chemist,' a monthly journal devoted to chemical science. To this and to the annual reports of the New York health department he has contributed many papers on chemistry, water-supply of cities, purification of coal gas, on petroleum, milk, sorghum, and glucose.

CHANDLER—CHANGA

Chandler, Elizabeth Margaret, American poet: b. near Wilmington, Del., 24 Dec. 1807; d. 22 Nov. 1834. Her most popular poem was 'The Slave Ship.' Many of her subsequent verses were written in the same strain, and published in the 'Genius of Universal Emancipation,' a Philadelphia abolitionist periodical. Her poems were published with a memoir by Benjamin Lundy (1836).

Chandler, Frank Wadleigh, American writer: b. Brooklyn, N. Y., 16 June 1873. He graduated at the Polytechnic Institute of Brooklyn, 1894; studied literature and philosophy at Columbia University, and at Oxford, London, and Paris, 1895-9. Since 1899 he has been professor of literature and history in the Polytechnic Institute, and since 1901 lecturer in comparative literature at Columbia. He has written 'Romances of Roguery, an Episode in the History of the Novel' (1899), and 'Some Theories of the Novel's Evolution in East and West' (1900).

Chandler, Richard, English archæologist: b. Elson, Hampshire, 1738; d. Tilehurst, Berkshire, 9 Feb. 1810. He was educated at Winchester and at Queen's and Magdalen colleges, Oxford. His first important work was 'Marmora Oxoniensia' (1763), an elaborate description of the Oxford marbles. He afterward traveled through Greece and Asia Minor, with Revett, architect, and Pars, a painter, at the expense of the Dilettanti Society, to examine and describe the antiquities. The materials collected were given to the world in the following publications: 'Ionian Antiquities' (1769); 'Ancient Inscriptions' (1774); 'Travels in Asia Minor' (1775); and 'Travels in Greece' (1776). Chandler was an Anglican clergyman and at his death was rector of Tilehurst, near Reading.

Chandler, Seth C., American astronomer: b. Boston, Mass., 16 Sept. 1845. He is well known for his investigations and observations of the phenomena of variable stars, the computation of comet orbits, and, in connection with Ritchie, for devising a system of astronomical code-telegrams for the announcement of astronomical discoveries. He also invented the Almucantar, and published a very complete treatise on the method of its use. He is an authority on the subject of variable stars, of which he has published a complete catalogue.

Chandler, William Eaton, American politician: b. Concord, N. H., 28 Dec. 1835. He was graduated at Harvard Law School in 1855, entered the New Hampshire legislature in 1862, became judge advocate general of the navy department in 1865, and secretary of the navy in 1882, serving three years. In 1887-1901 he was a United States senator from New Hampshire.

Chandler, Zachariah, American statesman: b. Bedford, N. H., 10 Dec. 1813; d. 1 Nov. 1879. He received a common school education, and early in life went to Detroit, and engaged in the dry goods business, in which his energy and ability soon brought success and put him in possession of a handsome fortune. He was mayor of Detroit in 1851, the defeated Whig candidate for governor of Michigan in 1852, an active organizer of the Republican party in 1854, and in January 1857 was elected to the United States Senate to succeed Gen. Lewis Cass. He was re-elected in 1863 and 1869; then

served for a time as secretary of the interior in President Grant's cabinet, and was again elected to the Senate in February 1879. He opposed the admission of Kansas under the Leecompton constitution 1858, and he was the author of the famous "blood letter," in which he said "without a little blood-letting, this Union will not, in my estimation, be worth a rush." Though a warm friend of Lincoln, he was more radical than the latter, and often differed from him in matters of public policy. In July 1861 he introduced a sweeping confiscation bill which failed to pass; and in July 1862 violently assailed McClellan in a speech in the senate. He was a man of imposing presence, fine judgment, great energy, and perseverance. He was found dead in bed on the morning after delivering a political address in Chicago.

Chandler School of Science. See CHANDLER, ABIEL.

Chan'dos, the name of a noted English family, descended from a follower of William the Conqueror, the last representative in the direct male line being Sir John Chandos (d. 1428), whose sister married one Giles Brydges. Their descendant, Sir John Brydges, was lieutenant of the Tower under Queen Mary, and was created Baron Chandos in 1554. James Brydges (1673-1744), eighth Lord Chandos, sat in Parliament for Hereford from 1698 to 1714, and was created Duke of Chandos in 1719. The lucrative post of paymaster of the forces abroad supplied means for building a palace at Canons, near Edgeware, which cost \$1,000,000, but was torn down at the Duke's death. Here Handel lived two years, wrote anthems for the chapel service, and produced 'Esther.' In 1796 the title passed by marriage to the family of Grenville, now retaining the title of Duke of Buckingham and Chandos.

Chandpur, chünd- or chand'-poor, India, a town in the Bijnaur district of the Northwest Provinces, about 40 miles east-northeast of Meerut. It is thriving, well paved, and drained; there is a trade in sugar and grain, besides some manufactures of cotton cloth, pipes, etc. Pop. 13,000.

Chang-Chau, cháng'-chow', China, a city in the province of Fokien, 35 miles west-northwest of Amoy, which is its port. It stands in a valley surrounded by hills and intersected by a river. Its walls are about four and a half miles in circuit, and immediately within is a space planted with large trees. It is the centre of the silk manufacture of the province. Pop. about 900,000.

Chang-Sha, cháng'-shá', China, capital of the province of Hu-Nan, on the Siang River. It is not a treaty port, but has an important native trade carried on in small boats. A telegraph station is projected and in 1900 surveys were completed for a railway. Pop. about 350,000.

Chan'ga, a species of mole-cricket (*Scapteriscus didactylus*) injurious in Porto Rico. The changa is found throughout that island, living in galleries in the earth, and damaging the crown and roots of the tobacco, cane, and small crops; it is the most serious insect pest in the island. (See MOLE-CRICKET.) Consult Barrett, 'The Changa, or Mole-cricket'; 'Bulletin No. 2, Porto Rico Agricultural Experiment Station,' Washington, 1902.

CHANGARNIER — CHANNELING-MACHINE

Changarnier, shān-gār-nē-ā, **Nicholas Anne Theodule**, French general: b. Autun 26 April 1793; d. Versailles 14 Feb. 1877. He was educated at Saint-Cyr, and went in 1830 to Algeria, where for 18 years he saw much active service. On the proclamation of the republic in 1848 he acted as provisional governor-general of Algeria, but returned to Paris to take command of the garrisons of Paris and of the national guard. He did much to check the outbreaks of the anarchist party during 1849. At the *coup d'état* in December 1851, after being imprisoned in Ham, he went into exile till the Franco-Prussian war, when he offered his services to Napoleon III. He was in Metz with Bazaine, and, on its capitulation, retired to Brussels. He returned to France in 1871, entered the assembly, and assisted M. Thiers in reorganizing the army.

Change of Colors. See CHATOYANCY.

Change of Function. During the metamorphosis of insects, *Crustacea*, and other animals, organs at first adapted for certain uses become, with change of conditions of life, media, and consequently of habits, adapted to quite different uses or functions. Thus in the young larva (Nauplius) of many of the lower *Crustacea*, the three pairs of head appendages are formed for swimming; the first two pairs afterward change into the two pairs of antennae, the third pair becoming the jaws of the adult. In the tadpole, which lives on dead leaves or animal matter, the intestine is very long and coiled, but in after life, when the frog feeds on living insects, it is very much changed in form, being much shorter. There are many examples of change of function by suppression of the original or chief function, what was a minor use becoming the chief one. Other examples are the transformation of the jaws of biting insects into the needle-like elements, aiding in the formation of the beak of bugs (q.v.); the transformation of the hypopharynx of caddis-flies into the piercing organ of fleas and flies; the modification of the maxillae of biting insects into the spiral tongue of the butterfly. The mouth-parts of bees and butterflies lost their primitive functions and adopted entirely new shapes and uses after flowers appeared. Among fishes the clearest example is the change of the swimming-bladder of the gar pike, where it also functions as a breathing organ, until in the lung-fishes, which have probably descended from some ganoid, it becomes a lung.

These changes of functions are due to change of the surroundings, and consequently of habits, finally bringing about change of function. Hertwig states that a muscle may from many causes become functionless, but finally becomes transformed into a ligamentous band. What are the gill-supports of fishes may, as the results in certain of their descendants of the adoption of a terrestrial mode of life, become in part degenerate, while another part persists by assuming a new function, forming the jaws, the hyoid bone, and the small bones of the ear, which are morphologically the same structures as the gill-arches. Consult: Dohm, 'Der ursprung der Wirbelthiere und das Princip des Functions nichsels'; Hertwig-Kingsley, 'Manual of Zoology.'

Change of Life. See MENOPAUSE.

Change'ling, a child left or taken in the place of another. It was at one time a common superstition that young children were liable to be stolen or changed by fairies before being baptized; and hence they were carefully watched till that ceremony was over. It was thought that the fairies were always anxious to change their own starveling elves for the more robust children of men. The children so left were called changelings, and were known by their greater backwardness in growth or learning; hence, stunted or idiotic children were regarded as changelings.

Chank-shell, the shell of a gastropod mollusk (*Turbinella rapa*). An extensive fishery of these shells, which live in water from 12 to 15 feet deep along the shores of Ceylon and India, has been established at Tuticorin. The shell is a sacred emblem of Vishnu, who is often represented as holding a "sinistral" one in his hand. They are used by the Hindu women as bangles and leg ornaments, or anklets. The chank appears as a symbol on the coins of some of the ancient Indian empires, and is still retained on the coinage of the Rajah of Franvacore.

Chanler, Amelie Rives. See TROUBETSKOY.

Chan'ler, William Astor, American explorer: b. Newport, R. I., 11 June 1867. He studied at Harvard, but left the university to make explorations in Africa. He was elected to the New York legislature in 1897, and to Congress in 1898 as a Democrat. He served in the war with Spain and was commended in Gen. Shafter's reports. He has written 'Through Jungle and Deserts' and 'Travels in Eastern Africa'; etc.

Chan'nel Islands, a group of islands in the English Channel belonging to Great Britain, off the west coast of the department La Manche, in France. They consist of Jersey, Guernsey, Alderney, and Sark, with some dependent islets; area, 75 square miles. They are picturesque and very fertile, and are celebrated for a peculiar breed of cattle, the chief strains of which are the Jerseys, Guernseys, and the Alderneys, which differ from each other in minor characteristics. The islands are almost totally exempt from taxation, and the people enjoy besides all the privileges of British subjects. There are two lieutenant-governors, one for Jersey, and the other for Guernsey, Alderney, and Sark. The government is in the hands of two corresponding bodies called the "states," some members of which are named by the Crown, while others are chosen by the people, and others sit *ex officio*. These islands have been fortified at an immense expense. Ecclesiastically they belong to the diocese of Winchester. The Channel Islands form the only remains of the Norman provinces once subject to the English crown. They now export large quantities of fruit, vegetables, and flowers to the English markets, including grapes, tomatoes, and potatoes, partly grown under glass. The fisheries also are important. French is generally spoken. Pop. (1901) 95,841.

Channeling-machine, a machine for cutting the channels in boot-soles, to allow the thread to bury itself in the leather and be protected from immediate wear. It consists of a knife, which makes an oblique cut in the sole to a gauged depth and regulated as to distance from the sole-edge by a guide.

CHANNELS — CHANNING

In stone-working the term is applied to a machine having a series of jumpers or chisels which make a groove across the face of a block in the quarry, or detached. It has a gang of cutters operated by direct-acting steam cylinder. The cutters have direct motion from the piston. The valve is reversed at the blow of the cutters; or, in case of no blow being given, it is reversed before the cylinder bottom is touched by the piston. The cutter-bar is adjustable on the cylinder-bar to suit the depth of groove cut. The whole mechanism is mounted on vertically adjustable rollers, and the feed device is operated from the cross-head.

Channels, or **Chain-wales**, of a ship, pieces of wood or iron projecting edgewise like a ledge from the ship's outside, abreast of and extending somewhat behind the masts. They serve to extend the shrouds and to prevent them from touching the gunwale, or being injured by rubbing against it.

Chan'ning, Blanche Mary, American author: b. Liverpool, England, about 1863; d. Brookline, Mass., 9 Aug. 1902. Her father was Rev. William Henry Channing (q.v.), an American clergyman, for many years in charge of a Unitarian Church in Liverpool, and she was a grandniece of the famous Dr. William Ellery Channing (q.v.). In 1890 she came to the United States and devoted herself to literary work and poster and book-cover designing. She was the author of 'Zodiac Stories' (1899); 'Wimired West' (1901); 'The Balaster Boys' (1902).

Channing, Edward, American historian: b. Dorchester, Mass., 15 June 1856. He graduated at Harvard in 1878, and in 1883 was appointed instructor in history there, becoming successively assistant and full professor of history. He has written: 'The Narragansett Planters' and 'Town and County Government of the English Colonies in North America' (Johns Hopkins Studies, 1883-4); 'Columbus and His Companions,' in Winsor's 'Narrative and Critical History of the United States' (1888); 'The United States, 1765-1865'; in collaboration with A. B. Hart, 'Guide to the Study of American History' (1896); and with T. W. Higginson, 'English History for Americans.' In 1882 he translated B. Delbrück's 'Introduction to the Study of Language.' He is a son of William Ellery Channing (1818-1901) (q.v.).

Channing, Edward Tyrrel, American scholar: b. Newport, R. I., 12 Dec. 1790; d. Cambridge, Mass., 8 Feb. 1856. He was a brother of William Ellery Channing, 1780-1842 (q.v.). He studied law with his elder brother, Francis Dana Channing, in Boston, and was admitted to the bar. He gave his attention chiefly to literature, and carried forward a careful and critical study of the Greek and Roman classics, with that of the great writers of England. The 'North American Review,' the earliest permanent periodical in America, had its origin in a club of young men, who, in the winter of 1814-15, projected a bi-monthly magazine. Willard Phillips, afterward author of the celebrated works on the law of insurance and of patents, was to be its editor. The committee on politics was composed of George Cabot, James Lloyd, John Lowell, Josiah Quincy, and others. The chief managers were to be President Kirkland, Jared Sparks, George Ticknor, Mr. Chan-

ning, Richard H. Dana, and John Gallison. At this time, William Tudor, author of the 'Life of James Otis,' returned from Europe with a matured plan for a quarterly review; and as the field was not large enough for two such works, the plan of the magazine was merged in that of Mr. Tudor, and the first number of the 'North American Review' was issued in May 1815, as a bi-monthly, the quarterly publication not being adopted until the commencement of the eighth volume. Tudor edited it for two years, and in 1817 it passed under the control of a club. Jared Sparks was chief editor for one year, when the duty was undertaken by Channing, aided by his cousin, Richard H. Dana. In October 1819, Mr. Channing was succeeded in the editorship of the 'Review' by Edward Everett, having been appointed Boylston professor of rhetoric and oratory in Harvard University. This post he held for 32 years, resigning it in 1851. During all this time, the department of rhetoric and oratory, including the charge of all the English compositions of the students, and carrying great influence over their reading and taste, was filled by him with more than satisfaction to the public of reading and thinking men.

He established and maintained for the college a high reputation for purity and elegance of style in composition and elocution, and gave direction to the reading of an entire generation of leading men in all departments of intellectual labor. He was a constant contributor to the 'North American Review,' almost to the time of his death. In 1856 a volume of his lectures to the senior class at Harvard was published. He was highly esteemed for the charm of his conversation, which was choice and pure in style, with an occasional use of a restrained but effective humor. He was a man of pure and just character, thoughtful and scholarly habits, with few and warm friendships; tolerant and liberal views of his fellow beings; a Unitarian of the old school in his theology, and a philanthropic conservative in his politics.

Channing, Francis Allston, English writer: b. United States 21 March 1841. He is a son of William Henry Channing (q.v.) and a brother of Blanche Mary Channing (q.v.) and was educated at Exeter College, Oxford. He has been prominent in advocating agricultural and educational reforms and has published 'Instinct'; 'The Greek Orators as Historical Authorities'; 'The Second Ballot'; 'The Truth About Agricultural Depression.'

Channing, William Ellery, American Unitarian clergyman: b. Newport, R. I., 7 April 1780; d. Bennington, Vt., 2 Oct. 1842. Entering Harvard College at 14 he took his degree in 1798 and though at first inclining to the study of medicine, presently decided upon the profession of the ministry. After his graduation he spent two years in Virginia as a tutor, but in pursuance of his ascetic views regarding renunciation, and the necessity of subduing the animal nature, he endeavored to accustom himself to hardships during this period, even denying himself sufficiency of food and clothing. The result of this unwise course was to implant in him the tendency to disease that made him for the greater part of his career a semi-invalid. Returning from Virginia he took up the study of theology, making at the start a careful study of the evidences of Christianity, wishing, as he

CHANNING

said, to know what Christ taught and not what men made him teach. In 1801 he was made regent of Harvard, the duties of this office being light, and the salary sufficient for his support while continuing his studies. In 1802 he preached his first sermon at Medford, Mass., from the text "Silver and gold have I none; but such as I have, give I thee." In 1803 he was ordained pastor of the Federal Street Church in Boston and continued in that relation for the rest of his life. In the earlier years of his ministry the denominational spirit was not especially strong in him and with the ministers of the Trinitarian churches in Boston, he was on most friendly terms. His opinions were ripening during this period, however, and in 1819, at the ordination of Rev. Jared Sparks in Baltimore, he preached a sermon in which for the first time he gave free expression to the principles of Unitarian Christianity, upholding the exercise of reason in religious matters; declaring the Bible to be "a book written for men in the language of men, and its meaning to be sought in the same manner as that of other books." He also objected to the doctrine of the Trinity, affirming his belief that Christ was distinct from and inferior to God, and sent to men as a great moral teacher, not as a mediator between erring man and offended deity. This discourse gave rise to much controversy and fixed definitely the Unitarian position as distinguished from that of the Trinitarians. It made him, moreover, the recognized leader of American Unitarianism, and much as he disliked controversy he never hesitated from uttering what he believed to be true because of hostile criticism. His greatest dread was of becoming creed-bound and thus losing perception of new truths, and he even spoke of himself as "little of a Unitarian," and standing aloof "from all but those who strive and pray for clear light, for a purer and more effectual manifestation of Christian truth." After 1824 Rev. Ezra Stiles Gannett was associated with him in the ministry of the Federal Street parish, and from this epoch his time was largely given to philanthropic and literary work, the asceticism of his youth having long since been supplanted by a more wholesome understanding of life and its requirements and duties. He visited Europe in 1822 and became acquainted with Coleridge and Wordsworth. He was one of the first to acknowledge the greatness of the latter, and save Shakespeare, he read no poet oftener. Channing was a fearless defender of freedom, and upheld Garrison when that great abolitionist was the most generally detested person in Boston. In the pulpit his mission, as he saw it, was to free men's minds from servile conceptions of God, to disabuse religion of its benumbing terrors, and to show forth to men the real significance of their moral natures. His writings on theological, social, and philanthropic themes have received the widest circulation and been translated into French, Italian, German, Icelandic, Russian, and Hungarian. The most notable of them include: 'Evidences of Revealed Religion'; 'Essay on National Literature' (1823); 'Remarks on the Character and Writings of John Milton' (1826); 'Character and Writings of Fénelon' (1829); 'The Duty of the Free States' (1835); 'Self Culture' (1838). He had a life-long abhorrence of slavery, but in his 'Duty of the Free States' his feelings on the

subject find fullest expression. His name, moreover, was associated with the most of the social reforms of his day and besides bearing a part in the great anti-slavery agitation, he warmly sympathized in the temperance movement, was an ardent lover of peace, and deeply interested in schemes for educational advance. He stood for intellectual and spiritual ideals and foresaw dangers both to nations and individuals, in the spread of materialism, in the contented adoption of inadequate aims, complacent satisfaction with perishable interests. In an age when comparatively few religious leaders dared to think outside of narrow prescribed limits, Channing stood forth as the intellectual champion of freedom. Much of his influence may have been due, no doubt, to the singular sweetness of his disposition, and his entire nobility of character, but more of it was due to the fact that he spoke with utter fearlessness and thus inspired other men to free themselves from the fetters of dogma or of intellectual timidity. Although two generations have passed since his death, his name is still both familiar and beloved, and his beneficent influence, far from lessening its hold upon men, has deepened and widened with the years. Channing's literary style, while not highly ornamental, was both clear and vigorous, and his sentences were usually short and direct, though it is said that his personal preferences in the writings of others were for long and involved sentences. On 1 June 1903, a bronze statue of Channing by Herbert Adams was unveiled in the public garden in Boston, Mass., its site being opposite the Arlington Street Church, the successor of the Federal Street Church, of which he was so long pastor. The statue and its monumental setting were the gift of John Foster to the city. See 'Lives' by W. H. Channing and C. T. Brooks; 'Correspondence of Channing and Lucy Aikin'; Peabody, 'Reminiscences.'

OSCAR FAY ADAMS,

Editorial Staff 'Encyclopædia Americana.'

Channing, William Ellery, American poet; nephew of William Ellery Channing, the elder: b. Boston, Mass., 10 June 1818; d. Concord, Mass., 23 Dec. 1901. After some years spent in newspaper work he retired to Concord, where he lived the life of a recluse. His writings include: 'Poems' (1843-7); 'The Woodman' (1849); 'Near Home' (1858); 'The Wanderer' (1872); 'Conversations in Rome' (1847); and 'Thoreau, the Poet-Naturalist' (1873); 'Eliot'; 'John Brown.'

Channing, William Henry, American clergyman: b. Boston 25 May 1810; d. London 23 Dec. 1884. His father, Francis Dana Channing, died when he was very young. He graduated at Harvard College in 1829, and entering the Unitarian ministry preached with much success in Meadville, Penn., New York, Cincinnati, Nashua, Boston, and Rochester. Settling in England, he succeeded James Martineau as pastor of the Hope Street Chapel in Liverpool 1852-62. He was for two years chaplain of the Senate at Washington, but from the close of the Civil War lived entirely in England. He published: 'Memoirs of Dr. William Ellery Channing' (1848); 'Life and Writings of James H. Perkins'; 'Memoirs of Madame Ossoli (Margaret Fuller)', in connection with R. W. Emerson and J. F. Clarke. His addresses and discourses were often extemporaneous and deliv-

CHANSON DE ROLAND—CHANTILLY

ered in a style highly impassioned and imaginative. During a considerable part of his career he was an earnest advocate of social reform. See 'Life,' by Frothingham (1886).

Chanson de Roland, the culmination of a cycle of 'Chansons de Geste' or 'Songs of Valor,' celebrating the heroic achievements of Charlemagne. They are inspired especially by the joy and pride of the triumph of Christian arms over the Mohammedan invasion, which, through the gate opened by the Moors of Spain, threatened to subdue all Europe. The French text of the 'Chanson' was first published in Paris by M. Francisque Michel in 1837, and afterward in 1850 by M. F. Genin. Tyrwhitt, in his edition of Chaucer, was the first to call the attention of English readers to the 'Chanson'; but English tradition has it that the song was sung by the Norman Taillefer just before the battle of Hastings. The best and oldest French MS., called the 'Digby,' is preserved in the Bodleian library at Oxford. The French poem contains 6,000 lines. A fragment of 1,049 lines, translated in Middle English from what is known as the Lansdowne MS., is published by the Early English Text Society.

Chansons de geste, *shansón' de zhest'*, the romances of the Middle Ages sung or recited by wandering minstrels. Their number in French is very large; in English they are not so numerous and most of them are translations of a French original.

Chant, Laura Ormiston Dibbin, English lecturer and reformer: b. Chepstow, Monmouthshire, 1848. In 1876 she was married to Thomas Chant. She has taught in schools as well as nursed in hospitals and has lectured widely both in England and the United States on literary and scientific subjects, being a prominent advocate of woman's suffrage, temperance, etc. She has published: 'Verona and Other Poems'; 'Short Stories'; and several collections of original songs.

Chant, a short musical composition adapted to the singing of the psalms and canticles. Chants are single when adapted to a single verse, and double when adapted to two verses, the former consisting of two strains of three and four bars respectively, and the latter being of twice that length. More recently quadruple chants extending over four verses have been introduced. The complete chant consists of four parts, namely: (1) the intonation or initial phrase leading up to the reciting note; (2) the reciting note, which is the dominant of the mode employed; (3) the mediation, or main body of the chant; and (4) the termination or concluding phrase. In modern Anglican chants, however, there is no intonation. The origin of the plain song of the Church is unknown, but the first attempt to reduce the traditional music to some definite system was made by Saint Ambrose, bishop of Milan (d. 397). More important, however, by far is the Antiphonarium of Gregory the Great, which appeared in the latter half of the 6th century and soon established itself as the chief and in fact only authority on Church music. The Gregorian tones were introduced into England by Saint Augustine, and in the course of their history in that country they underwent many modifications in the various local "uses." During the Civil War and the Commonwealth they went out of use,

but were revived at the Restoration. Not long afterward, however, the Gregorian chants began to give place to the modern double chants, and it is only in quite recent years that attempts have been made to revive them.

Chant du Depart, *shán dü dā-pär* (Fr. "Song of Departure"), a popular French military song of the period of the Revolution, written by the poet Marie Joseph Chenier, to the music of Méhul.

Chantabon, *shan-ta-bün'*, or **Chantiban**, an important commercial port of Siam, on the east side of the Gulf of Siam, near the mouth of the Chantibun River. It is occupied by the French as security for fulfilment of the treaty of 1893. It is a place of considerable trade, and gives access to a rich mineral district. Pop. (estimated) 30,000.

Chantal, *shan-tal*, **Jane Frances Frémiot** (*frām-yō*) **de**, SAINT, French devotee, founderess of the order of the Visitation B. V. M.: b. Dijon, France, 1572; d. Moulins 13 Dec. 1641. She was the daughter of a president of the Dijon parliament. On the death of her husband, Christophe Rabutin-Chantal, in 1600, she vowed not to marry again but to devote herself wholly to religious and charitable duties, under the direction of St. Francis de Sales, bishop of Geneva. The institute of the Visitation nuns was founded in 1610 at Annecy, and at her death it had 87 houses, and 60 years later 150 houses with 6,000 inmates—nuns and girls receiving a secular and religious education. She was canonized by Clement XIII. in 1767; her day in the Roman Calendar is 21 December. Her son, Celse Benigne de Rabutin-Chantal, was the father of the celebrated Madame de Sévigné. Her life and letters were published at Paris (1779).

Chanterelle, an edible mushroom (*Cantharellus cibarius*) of a bright orange color, with a pleasant fruity smell, growing in woods and on dry pastures. See MUSHROOM.

Chantibun. See CHANTABON.

Chantilly, *shán-tē-yē*, France, a town in the department Oise, 25 miles north-northeast of Paris, on the Nonnette, celebrated for its splendid château, built for the Duc d'Aumale in 1876. It stands on the site of an older château which first became important under Anne de Montmorency. In 1632 it passed to the house of Condé, but the greater part was demolished at the Revolution. The last prince of Condé bequeathed the domain to the Duc d'Aumale in 1830. The present building and domain, including fine grounds and gardens, an extensive forest, etc., were presented by the Duke to the French Institute in 1886. The château contains a valuable library and a precious collection of works of art. The place was formerly celebrated for its manufacture of lace ("Chantilly lace"). It is a great horse-racing and training centre. Pop. 4,500.

Chantilly, *shán-tī'li*, or **Ox Hill, Battle of**. On 31 Aug. 1862, the day after the second battle of Bull Run, Gen. Lee marched his army by way of Sudley Ford around Pope's right at Centreville, to seize Fairfax Court-House and interpose between Pope and Washington; and at night Jackson, who was in advance, bivouacked six miles west of Chantilly, on the Little River turnpike, Longstreet some distance in rear.

CHANTREY

Next morning Gen. Stuart informed Jackson that a part at least of the Union army was at Fairfax Court-House, and that Pope's trains were passing on the road from Centreville to that place. Jackson moved cautiously toward Fairfax Court-House, and on reaching Ox Hill, three miles east of Chantilly, was informed by Stuart that the Union force seemed very strong on the road in front. Then Jackson formed line on Ox Hill ridge, his artillery massed on the left of the road, his infantry on the right, extending in the direction of the Centreville road. He had not completed his formation when he became aware of an approaching force from the Centreville road, upon which he strengthened his right and threw out skirmishers. About 1 p.m. Pope, who had heard of Jackson's advance toward his rear, sent Gen. I. I. Stevens with nine regiments, about 3,000 men, of Reno's corps to gain the road two miles east of Chantilly and hold Jackson in check until the army could be brought into position at Fairfax Court-House. Stevens moved from near Centreville across the fields, unexpectedly struck Jackson's advancing skirmish-line, thrown out from his right, and drove it back into a body of woods. Jackson then advanced a regiment from the woods, which was immediately driven back by Benjamin's battery. Stevens now formed a column of assault, six regiments in three lines, two regiments in a line. At 4.30 p.m. he placed himself in the centre of this column of 2,000 men, on open ground, and ordered it forward, Benjamin shelling the woods in front. Not a sight nor sound betrayed the presence of an enemy, until the advancing column, ascending a gentle slope, came to within 75 yards of the woods, when from a worm fence bordering them, came a terrific volley from Branch's brigade, smiting the column with great effect, men going down by the score. At first it began to waver, but quickly bracing up returned the fire, five color-bearers of the 79th New York, Stevens' old regiment, went down in succession. The assault was checked, Stevens ran forward, seized the colors and, calling upon his men to follow him, all rushed forward, routed Branch, and gained the fence, Stevens falling dead on it, with a bullet through his brain and the colors upon his head and shoulders. The column pushed on into the woods. At the moment of reaching the fence a sudden and terrific thunderstorm and fierce gale burst over the field, blowing the rain into the faces of the men on both sides, impeding their movements and wetting their ammunition. Jackson brought up fresh men, and after a contest of more than an hour the six regiments were driven out of the woods and fell back to the point where they had formed, and on the right of where Birney's brigade of Kearny's division had come up. Meanwhile three regiments of Reno's command had been sent in on Stevens' right, one only of which, the 21st Massachusetts, became seriously engaged and was repulsed with great loss. Gen. Kearny now came up with a battery, which he put in position and went to the right for a regiment to fill an interval on Birney's right. He met the 21st Massachusetts as it came out of the woods, and was leading it to the left when his attention was called to the fact that the Confederates were advancing from the woods and through a cornfield on Birney. He spurred his horse into the corn-

field to reconnoiter, ran upon a skirmish-line, saw his mistake, and turned to ride back, when he was shot through the body and killed. A sharp encounter ensued between the 21st Massachusetts and the Confederates, which was ended by darkness; the regiment withdrew, the Confederates retired to the woods, and the battle was ended, neither side having permanently gained a foot of ground. The other two brigades of Kearny came up, and the ground was held until 3 o'clock in the morning of the 2d, when Kearny's and Reno's men fell back to Fairfax Court-House after the last of Pope's army from Centreville had passed. Pope fell back to Washington, and Lee marched to cross the Potomac into Maryland. The Union loss at Chantilly was about 800; that of the Confederates about 700. In the death of Kearny and Stevens the Union army lost two of its best officers. Consult: 'Official Records,' Vol. XII.; Hazard Stevens, 'Life of Gen. I. I. Stevens,' Vol. II.; G. H. Gordon, 'Army of Virginia.'

E. A. CARMAN.

Chantrey, chă'n'trî, Sir Francis Legatt, English sculptor: b. Jordanthorpe, Derbyshire, 7 April 1781; d. 25 Nov. 1842. The chief amusement of his boyhood was in modeling figures in clay and drawing likenesses, and at his own request he was apprenticed in 1797 to a carver and gilder at Sheffield. Here he attracted the attention of J. Raphael Smith, a mezzotinto engraver and portrait-painter, who, perceiving his decided inclination for drawing and modeling, gave him instructions which tended greatly to prepare him for his future career. By 1804 he was resident in London, studying at the Royal Academy. Having acquired much reputation as a sculptor, he became the successful candidate for the marble bust which the inhabitants of Sheffield had resolved to erect to the memory of the Rev. J. Wilkinson. This interesting work, which may be said to have finally decided his future course, is in Sheffield Parish Church. Having settled permanently in London, he presented numerous busts at the exhibitions of the Royal Academy. About the same time he was a successful candidate for a statue of George III. for the city of London, and soon was almost universally regarded as the first monumental sculptor of the day. In 1815 he was chosen an associate and in 1818 a member of the Royal Academy. In 1819 he visited Italy, where he was elected member of the academies of Rome and Florence. He was knighted in 1835. His most celebrated works are the 'Sleeping Children,' a monument erected to two children of the Rev. W. Robinson, in Lichfield Cathedral; the statue of Lady Louisa Russell, daughter of the Duke of Bedford, in Woburn Abbey; Lady Frederica Stanhope with her infant child, in Chevering Church; Sir Joseph Banks, at the British Museum; Roscoe and Canning, at Liverpool Town Hall; James Watt, at Glasgow; the bronze statue of William Pitt, in Hanover Square, London; and statues of Horner, Sir J. Malcolm, etc., in Westminster Abbey, and a statue of Washington in the State House at Boston, Mass. His finest works are his busts, among the best of them being Sir Walter Scott, Watt, Wordsworth, and Porson. His full-length figures are said to betray an insufficient acquaintance with anatomy, and several of his equestrian statues in bronze are still more defective. The

CHANTRY — CHAPARRAL-COCK

postures are formal, and the horses, in their bodies and limbs, are very inanimate. He made munificent bequests for the advancement of art, the Royal Academy being endowed with a large fund for the purchase of works of sculpture and painting by artists residing in Great Britain.

Chan'try (old French, *Chanterie*), an ecclesiastical endowment to provide for the celebration of masses for the prosperity of the living or repose of the dead. Previous to the Reformation chantries were very numerous, almost every family of importance having founded one or more. Wealthy founders would endow a church or monastery, in which religious services should be celebrated continually. For less wealthy founders, an altar in the church of the locality was made to suffice. Sometimes small chapels, called chantry chapels, were appended to the main edifice, and occasionally, as at Wakefield and Bradford-on-Avon, such chapels were erected on bridges. The residences of priests engaged in the services were known as chantry houses, chantries, or colleges. The Chantry schools were widely spread over England prior to the Reformation. Chantries were dissolved in England by King Edward VI., and nearly all endowments were devoted to the purposes of the Crown.

Chanute, chà-noot', Kan., a city in Neosho County, 125 miles southwest of Kansas City, Mo., on the Atchison, T. & S. F. and the Missouri, K. & T. R.R.'s. The city was incorporated in 1873. Manufactories here, including railroad shops, utilize the abundant natural gas of this locality, which is also used for lighting and various domestic purposes. The recent discovery of extensive oil-fields in the vicinity has led to a new and important industry, over 250 productive oil-wells having been opened. This industry promises rapid growth for the city, and also developments of great importance to the State. Pop. (1900) 4,208.

Chanzy, shàn-zê, Antoine Eugène Alfred, French general and politician: b. Nouart, Ardennes, 18 March 1823; d. Châlons-sur-Marne 4 Jan. 1883. After a course at the military school of Saint Cyr, he became sub-lieutenant of infantry in 1843, and was sent to Algeria. He subsequently served in Italy and Syria, but on becoming colonel he returned to Africa in 1868. On the outbreak of the war with Germany, in 1870, he was created a general of division, and after gaining the battles of Coulmiers and Patay, was put in command of the second army of the Loire. Here he fought heroically against the much stronger and more disciplined Germans, but finally had to retreat. He was elected to the National Assembly for the department of Ardennes, and during the Commune he narrowly escaped with his life. In 1873 he went to Algeria as governor-general, and in 1879 he stood for the presidency. In that year also he was sent to Russia as ambassador, a post which he held till 1881, when he became commander of the sixth army corps.

Chao-chow, chow'-chow', China, a city in the province of Kwang-tung, on the River Han, 195 miles northeast of Hong Kong. It is the centre of an important maritime division of the province. The channel leading to it is very shallow, so that ships of large burden can sail up only at high water. This city was included

in the Treaty of Tientsin (1858) as a port open to foreign trade, but the foreign trade is transacted at Swatow. Pop. (1900, estimated) 200,000.

Chaos, according to the signification of the word, the void which embraces all things. Hesiod mentions, as the original principles of all things, Chaos, Earth, and Eros (Love); other ancient poets made Chaos alone the primeval source from which everything is derived; others added to it Night, Erebus, and Tartarus; and others still represented Chaos as the parent of the Earth and Heaven; after the production of which Eros (Love) completed the creation. Modern writers commonly understand by chaos the unformed primeval matter from which the universe was made.

Chap-books, a species of cheap literature, in the form of small pamphlets, which preceded the popular periodicals of the present day and were so called because prepared expressly for sale by the chapmen, or pedlars, who hawked them from district to district. They were largely productions of the provincial presses. The writers are mostly unknown, but one of the authors of Scottish chap-books was Dougal Graham (1724-79), bellman of Glasgow. Their matter was of the most varied character, and some of them were decidedly coarse and vulgar.

Chapala, chà-pà'la, Mexico, a lake on the high plateau of Jalisco, surrounded by steep, bare mountains. It has an estimated area of 1,300 square miles, contains many islands, and is traversed by the Rio Grande de Santiago.

Chapeaux, shâ-pō (Fr. "hats"), a name applied to the partisans of France in Sweden in the 18th century, while those of Russia were called bonnets (caps). Having instigated war against Russia in 1741, and again in 1756, the calamities thus inflicted upon Sweden impaired the popularity of the *chapeaux*. Succeeding in 1769 in regaining their former position, the party was soon extinguished altogether by the advent of Gustavus III. and his reforms. The same names were also formerly applied in the French academy, the *chapeaux* constituting the party supported by the philosophers and the public, and the bonnets that upheld by the clergy and the court.

Chaparral-cock, chăp-a-răl'-kôk, one of the English names of a species of ground-cuckoo (*Geococcyx californianus*), so called from the chaparral, or scrub, which it inhabits. A remarkable bird which Coues aptly describes as a "cuckoo compounded of a chicken and a magpie," having a length of about two feet, of which a half is tail, very short wings, powerful legs, and feet of the cuckoo type, a rather long bill and crested head. The colors are changing and varied bronzes with brown and white markings. The chaparral-cock inhabits northern Mexico and southwestern United States, while a second related species is confined to Mexico. When pursued it seldom flies, but runs with great speed with upraised wings. Like other American cuckoos it builds a flimsy nest of twigs, in which six or more white eggs are laid at intervals. In feeding both animal and vegetable matter are partaken of. They are sometimes domesticated and trained to catch mice and other house pests. Other names applied to

CHAPEL — CHAPLEAU

this bird are road-runner, ground-cuckoo, paisand, and snake-killer, each of which suggests one of the peculiarities of the bird. See CUCKOO.

Chapel (French *chapelle*, Latin *capella*), a name for religious edifices of various kinds, especially for such as hold a subordinate position. In England and Scotland there are several kinds of chapels—parochial chapels, subordinate to, but distinct from, the mother church; chapels of ease, built for the accommodation of the inhabitants in large parishes; university chapels, and private chapels, whose names explain their uses. The term is also applied to small buildings attached to cathedrals, and separately dedicated. In England nonconformist places of worship are commonly called chapels in distinction from those of the Established faith to which the term church is applied. In the early history of the Massachusetts Bay Colony the Congregational body was the established church, and the first Episcopal church in Boston was consequently termed a chapel, retaining that name, "King's Chapel," to the present time. (See KING'S CHAPEL.) The word chapel is also applied to an association of union workmen in a printing-office for the purpose of promoting and enforcing order among themselves.

Chapelain, Jean, zhôn shăp lân, French poet, one of the earliest members of the French academy: b. Paris 4 Dec. 1595; d. there 22 Feb. 1674. Having gained a high literary reputation, more by ingratiating himself with Richelieu and other influential persons than by his intrinsic merits, he conceived the project of writing an epic, 'La pucelle,' which proved a total failure, although he spent over 20 years upon it. The first 12 cantos appeared in 1656; and to so high a pitch had public expectation been wrought, that, notwithstanding the adverse criticism of Boileau and Voiture, six editions came forth within the following 18 months. Eight new parts appeared in 1757, and the concluding four parts which never were printed, are in manuscript in the imperial library of Paris. Richelieu, to whom he dedicated a poem and whom he assisted in concocting literary works, conferred a pension on him; he presided over the organization of the French academy, took a conspicuous part in the early labors of that body, sat as academical critic upon Corneille's 'Cid,' and possessed during nearly 40 years a literary prestige, which was broken by his 'Pucelle,' although he remained in favor with the court.

Chapelle, sha-pêl', Placide Louis, American Roman Catholic clergyman: b. Mende, France, 28 Aug. 1842. He came to the United States in 1859, and was graduated at St. Mary's College, and was ordained a priest in 1865. For five years he was a missionary, and from 1870 to 1891 held pastorates in Baltimore and Washington. He was made coadjutor archbishop of Santa Fé in 1891; archbishop in 1894; and archbishop of New Orleans in 1897. The following year he was appointed by the Pope Apostolic Delegate to Cuba, Porto Rico, and the Philippines. In the latter archipelago he warmly espoused the cause of the friars, resisting the demand of the factions which sought their expulsion.

Chaperon, shăp'ê-rôn, a cap or hood. Such a covering is worn by Knights of the Garter, and was at one time in general use, but

was latterly appropriated to doctors and licentiates in colleges. A person who acts as a guide and protector to a lady at public places is called a chaperon, probably from this particular piece of dress having been used on such occasions. The name was also applied to devices which were placed on the heads of horses at pompous funerals.

Cha'pin, Edwin Hubbell, American clergyman: b. Union Village, N. Y., 29 Dec. 1814; d. New York 27 Dec. 1880. In 1837 he was ordained to the Universalist ministry, was a pastor at Richmond, Va., Charlestown and Boston, Mass., 1838-48, and then accepted a call to the Fourth Universalist Church in New York, a connection he retained until his death. His preaching attracted such throngs, especially of non-churchgoers, that within four years two changes were made to larger quarters. He was a pulpit orator of remarkable power and eloquence, and a popular lecturer whose services were always in demand. He laid small stress on creeds, but preached a high standard of earthly conduct, and his sermons dealt with every kind of social and political topic. His collected sermons and addresses are: 'Discourses on the Beatitudes' (1855); 'Select Sermons' (1860); 'Living Words' (1861); 'Lessons of Faith and Life' (1876); 'God's Requirements' (1881); 'The Church of the Living God, and Other Sermons' (1881). See 'Life,' by Ellis (1882).

Chapin, John R., American illustrator: b. Providence, R. I., 1823. He received a common school education and studied law, but took up art. He was a pioneer in periodical illustration in the United States. In 1853 he became art manager of the 'United States Magazine' and in 1861 for Harper Brothers. In 1863 he made the designs for the new series of bills for the national currency.

Chap'lain, a clergyman not having a parish or similar charge, but connected with a court, the household of a nobleman, an army, a prison, a ship, or the like. Chaplains in the United States army rank as captains of infantry; in the navy they have the rank of lieutenant, commander, and captain, according to length of their service.

Chaplain of the Fleet, The, a novel by Walter Besant and James Rice, published in 1881. It gives a detailed account of the famous Liberties or Rules of the old Fleet prison in London, and of the Fleet marriages of the 18th century. These "Rules" were houses in certain streets near the Fleet Market, where prisoners for debt were allowed to live, outside the prison, on payment of fees. Among these prisoners were clergymen, who performed clandestine marriages. A regular trade sprang up, touters were employed to bring clients, and every species of enormity was practised. Gregory Shovel was one of these clergy, and so plumed himself on his success in this iniquitous traffic that he took the name of "Chaplain of the Fleet." This novel is considered one of the best of those written under the firm-name of Besant & Rice.

Chapleau, shă-plô, Sir Joseph Adolphe, Canadian statesman: b. Saint Therese de Blainville, Quebec, 9 Nov. 1840; d. Montreal 13 June 1898. He studied law and distinguished himself at the bar. He was chosen leader of the Quebec Conservatives and formed a cabinet in 1879, re-

CHAPLIN — CHAPMAN

maining premier of Quebec till appointed secretary of state for the Dominion in 1883. He was lieutenant-governor of Quebec in 1893-8.

Chaplin, shāp-lăn, Charles Joshua, French portrait painter: b. Les Andelys 6 June 1825; d. Paris 30 Jan. 1891. He was of English parentage, but was naturalized as a French citizen. Under Napoleon III. he was engaged in decorating the Tuileries and the Elysée, and he also painted many ceilings and wall decorations in Parisian public and private buildings as well as various portraits, mainly those of women.

Chap'lin, Heman White, American lawyer and short-story writer: b. Rhode Island 1847. His 'Five Hundred Dollars and Other Stories of New England Life' ranks with the best works of its kind.

Chaplin, Jeremiah, American historical writer: b. Danvers, Mass., 1813; d. New Utrecht, N. Y., 5 March 1886. He was author of: 'Life of Charles Sumner'; 'Life of Franklin'; 'Riches of Bunyan'; 'Life of Galen'; and 'Life of Henry Dunster, First President of Harvard College' (1872), a work of much historical value.

Chap'man, Alvan Wentworth, American botanist: b. Southampton, Mass., 28 Sept. 1809; d. 6 April 1899. He graduated at Amherst 1830, studied medicine in Georgia and Florida, and in 1846 settled in Appalachicola, where he was collector of internal revenue 1865-6, and collector of customs 1866-9. He attained a high rank as a botanist, and the genus *Chapmannia* was named in his honor. He wrote: 'Flora of the Southern United States, Arranged According to the Natural System; the Ferns by D. C. Eaton' (1860, 2 ed. enlarged, 1883).

Chapman, Frank Michler, American naturalist: b. Englewood, N. J., 12 June 1864. Since 1887 he has been assistant curator in the department of vertebrate zoology in the American Museum of Natural History, New York. He is editor of 'Bird-Lore' and associate editor of 'The Auk.' Besides many papers in scientific journals, etc., he has published: 'Hand-book of Birds of Eastern North America' (1895); 'Bird-Life, a Guide to the Study of Our Common Birds' (1897); 'Bird Studies with a Camera' (1900).

Chapman, George, English poet, the earliest and perhaps the best translator of Homer; b. Hitchin Hill, Hertfordshire, 1557; d. London 12 May 1634. He was educated at Oxford, and in 1576 proceeded to London, where he made the friendship of Shakespeare, Spenser, Marlowe, and other distinguished writers of the time. As to his personal history little is known, but he is supposed to have held some post in connection with the court. The first of his works, so far as known, was the 'Shadow of Night,' a poem published in 1594. His translation of the 'Iliad,' in rhyming lines of 14 syllables each, was published in three separate portions, in 1598, 1600, and 1603. It has been highly commended by such poets as Pope, Keats, and Coleridge, as also by Lamb. Keats' sonnet 'On First Looking Into Chapman's Homer' ("Then felt I like some watcher of the skies," etc.) is well known. In 1614 appeared his translation of the 'Odyssey' in the same metre as the 'Iliad,' followed in the

same year by that of the 'Battle of the Frogs and Mice' and the Homeric hymns. He also translated Hesiod's 'Works and Days' and portions of various classic poets. He wrote numerous plays, almost all now forgotten, though containing some fine passages. The earliest of these was 'The Blind Beggar of Alexandria,' a comedy, 1598. He was associated with Jonson and Marston in writing the comedy of 'Eastward Ho!' which from its satirical reflections on the Scotch is said to have nearly brought severe punishment on the authors. Among his tragedies are 'Bussy d'Ambois', 'Cæsar and Pompey', 'Revenge for Honor', and two dramas on the life of Marshal Biron, which Swinburne characterizes as "a storehouse of lofty thought and splendid verse, with scarcely a flash or sparkle of dramatic action." An edition of his works was published (1873-4). See Swinburne, 'George Chapman: a Critical Essay' (1875); Matthew Arnold, 'On Translating Homer.'

Chapman, Henry Cadwalader, American physician: b. Philadelphia 17 Aug. 1845. He graduated at the University of Pennsylvania in 1863, from the medical department in 1867, and after three years study in Europe settled in practice in Philadelphia. He has lectured on 'Anatomy and Physiology' in the University of Pennsylvania; on 'Physiology of the Nervous System' in Jefferson Medical College, and is curator of the Philadelphia Academy of Sciences. He has published: 'Evolution of Life' (1878); 'History of the Discovery of the Circulation of the Blood' (1884); 'Medical Jurisprudence and Toxicology' (3 ed. 1903).

Chapman, J. Wilbur, American clergyman: b. Richmond, Ind., 17 June 1859. He graduated at Lake Forest University, Illinois, in 1879, and at Lane Theological Seminary in 1882. After pastoral work in Albany and Philadelphia, and evangelistic work in all parts of the country, he became pastor of the Fourth Presbyterian Church in New York. He is a prolific writer of Sunday-school and Christian Endeavor literature, of which the following are among his most recent titles: 'The Lost Crown' (1898); 'Spiritual Life of the Sunday-school' (1899); 'The Surrendered Life' (1899); 'From Life to Life' (1900); 'Life and Work of D. L. Moody' (1900); 'Revivals and Missions' (1900); 'Day by Day' (1901); 'Man Who Said He Would' (1902).

Chapman, John Gadsby, American artist: b. Alexandria, Va., 1808; d. 28 Nov. 1889. Early indicating his taste for design, he was enabled by the liberality of a friend to visit Rome, and to study and practise his art there for several years. After his return to the United States, he removed to the city of New York, where, by his rare union of mechanical ingenuity with artistic taste, he rapidly obtained ample employment. He executed many original designs for the illustration of works of taste or fancy, and also painted the 'Baptism of Pocahontas' for one of the panels in the rotunda at Washington. In 1848 he returned to Rome.

CHAPMAN — CHAPTAL

Chapman, John Jay, American lawyer and essayist: b. New York 1862. He was graduated from Harvard in 1884, was admitted to the New York bar and has been in active practice there since. His essays and speeches have attracted considerable attention on account of their striking individuality and original point of view. His published volumes include: 'Emerson, and Other Essays' (1898); 'Causes and Consequences' (1898); 'Practical Agitation' (1900).

Chapman, Maria Weston, American reformer: b. Weymouth, Mass., 1806; d. there 1885. She was a daughter of Warren Weston, and received her education in her native place and also in England. She married in 1830; became an active opponent of slavery in 1834; and after the death of her husband in 1842, went to Paris, France, and assisted the anti-slavery cause with her pen. She returned to America in 1856. She edited the autobiography of her friend, Harriet Martineau (1877), and wrote: 'Songs of the Free' (1836); 'Right and Wrong in Boston: Report of the Boston Female Anti-Slavery Society' (1836); 'Right and Wrong in Massachusetts' (1840).

Chapone, shā-pōn', Hester, English story-writer and poet: b. Northamptonshire 27 Oct. 1727; d. 1801. She wrote: 'Ode to Peace'; 'Fidelia,' a story; 'Miscellanies in Prose and Verse'; and other works.

Chapoo, chā-poo', China, a seaport in the province of Chekiang, on the north side of a large bay, 35 miles north from Ningpo. It is fortified and garrisoned by Manchu troops, carries on a very considerable trade, and was once the only Chinese port which was permitted to trade with Japan.

Clappe, Claude, klōd shāp, French engineer and mechanician: b. Rouen 1760; d. Brulon 23 Jan. 1805. Having invented an ingenious system of signals to communicate at a distance with his friends, he presented it to the French legislative assembly in 1792. It was successfully tried between Paris and Lille, on a length of 48 leagues, and was adopted by the government. Chappe established several lines in France, and the one running north was first put in motion to announce the recapture of the town of Condé from the Prussians. The inventor was at once rewarded by the convention, which, by a decree, appointed him *ingénieur télégraphique*. The lines were extended all over France, and the system was also adopted, with some alterations, through Germany and England. The attacks to which he was subjected, by persons jealous of his invention, preyed so much upon his mind that he committed suicide.

Chappe d'Auteroche, dō-tē-rōsh, Jean, French astronomer: b. Mauriac, Auvergne, 2 March 1722; d. San Lucas, Cal., 1 Aug. 1769. He was a priest, but giving his whole attention to astronomy, became one of the assistants of Cassini in delineating the general map of France, and edited the astronomical tables of Halley. In 1760 he was designated by the academy to make an observation of the transit of Venus over the sun's disk, which Halley announced would happen 6 June 1761. He consequently set out for Tobolsk, in Siberia, which was pointed out as the most favorable point of

observation. His mission was successfully accomplished; and returning to France at the end of two years, he published in 1768 his 'Voyage en Sibérie.' The following year he sailed for California to observe another transit of Venus, which was to take place June 3. He was equally successful on this occasion, but died soon afterward. The results of his last expedition were published by Cassini, under the title of 'Voyage de la Californie.'

Chap'pell, William, English author: b. 20 Nov. 1809; d. London 20 Aug. 1888. For the most of his life he lived in London, where he was for some years a member of a great music publishing house. His first work of importance was 'A Collection of National English Airs, Consisting of Ancient Song, Ballad, and Dance Tunes' (1838-40). He took a principal part in the foundation in 1840 of the Musical Antiquarian Society and the Percy Society, and published the first volume of a 'History of Music' in 1874.

Chapple, Joseph Mitchell, American journalist: b. La Porte City, Ia., 18 July 1867. He studied at Cornell College, Iowa, and was engaged in journalism in Dakota, Ashland, Wis., and Chicago until 1897, when he became editor and publisher of 'The Bostonian,' afterward changed to 'The National Magazine,' Boston, Mass. He has written two novels: 'The Minor Chord' (1895; new ed. 1898); and 'Boss Burt, Politician' (1896).

Chap'ra. See CHUPRA.

Chaptal, Jean Antoine Claude, zhōn àn-twān klōd shap-tal, COUNT DE CHANTELOUP, French chemist and statesman: b. Nogaret, Lozère, 4 June 1756; d. Paris 30 July 1832. During his medical studies and practice he devoted much research to the science of chemistry, in which he soon became eminent, and was appointed professor at Montpellier, where he taught successfully the doctrines of Black, Lavoisier, and Cavendish. He established chemical works near Montpellier, being the first attempted of the kind, and by which he was soon enabled to produce various chemicals hitherto imported, such as the mineral acids, alum, soda, and salts of lead. The authorities of Languedoc heaped honors on him: the Spanish government offered him a pension of 56,000 francs to go to Spain, and according to his biographer, Washington wrote three times to Chaptal, inviting him to America. After the outbreak of the French revolution he published a political pamphlet, entitled 'Dialogue Between a Montagnard and a Girondist,' and was arrested, but through the intercession of friends was liberated. The Committee of Public Safety placed him in charge of the powder mills of Grenelle, which produced, under his management, 3,500 pounds of gunpowder daily. Once more returning to Montpellier, he was elected member of the institute, and devoted himself to science, till Bonaparte summoned him to the council of state, where he had the supervision of national education. When Lucien Bonaparte resigned the portfolio of the interior, Chaptal took his place as minister, and for four years performed the duties of the department with much administrative ability. He founded the conservatory, school of arts,

CHAPTER — CHAPULTEPEC

and society for encouragement of industry, introduced the modern French system of weights and measures, established a model farm and a system of distribution of agricultural seeds, re-organized the prisons and hospitals, extended the network of highways over the face of the country, and organized the carrying out of the plans of extension of the Louvre and rues de Rivoli and Castiglione, since completed by Napoleon III. On Napoleon's return from Elba, the count was appointed director-general of commerce and manufactures. Louis XVIII. struck him from the list of peers, but left him on the roll of the academy. His works are all on chemical subjects, and may yet be consulted with advantage, especially his 'Treatise on Chemistry Applied to the Arts.'

Chap'ter (Latin *caput*, head), one of the chief divisions of a book. As the rules and statutes of ecclesiastical establishments were arranged in chapters, so also the assembly of the members of a religious order, and of canons, was called a chapter, because some or all of the chapters containing the rules were read there; and the place where they assembled, as well as the reproof administered to a delinquent member, by reading the rules of the chapter transgressed, had the same name. The orders of knights, which originally had much of the ecclesiastical constitution, used this expression for the meetings of their members, and even some corporations of mechanics or tradesmen call their assemblies chapters. In England, as elsewhere, the deans and chapters had the right to choose the bishop, but Henry VIII. assumed this right as a prerogative of the crown.

Chap'ter-house, a building attached to a cathedral, collegiate church, or church belonging to a religious house in which the chapter meets for the transaction of business. Chapter-houses are of different forms, being sometimes regular polygons of four, eight or ten sides, and in other cases circles or parallelograms; and their architecture is often noteworthy. Sometimes they were the burying-places of clerical dignitaries. Among the most notable of English chapter-houses are those at Lincoln cathedral (which is decagonal, with a central column), Salisbury, Wells, Southwell, and York, the two last named excelling all others in Great Britain in the beauty and richness of their carven stonework. There is a chapter-house at Bristol, of the Norman period, in shape a parallelogram, much enriched with ar-cading and various kinds of Norman ornament. The chapter-houses at Gloucester and Canterbury are likewise parallelograms, but of the Third Pointed or Perpendicular period.

Chapuis, shā-pwē, **Auguste Paul Jean Baptiste**, French musician: b. Dampierre-sur-Saône 20 April 1862. Since 1895 he has been inspector-general of musical instruction in the Paris schools. He has composed 'Tancred', a lyric drama, and much successful church music.

Chapultepec, chā-pool-tē-pēk' ('Grass-hopper Hill'), **Battle of**. This, the last considerable engagement of the Mexican war, and which was followed by the immediate occupation of the City of Mexico, was fought 12-13

Sept. 1847. Chapultepec is an isolated rocky mound 150 feet high, two miles southwest of the southwestern or Belén gate of the city, and guarding a main road into it; sharply precipitous on the northern, eastern, and part of the southern sides, but on the west and southwest sloping gradually to level marshy ground partly covered with a cypress grove. Here Montezuma and his predecessors had their pleasure grounds, and Chapultepec was their country-seat. A fortified castle was started here by the viceroy Galvez in 1785, but left unfinished; from 1822 it was used as a military academy, in 1847 having some 40 students, who fought heroically in the battle. It was guarded by strong batteries, and its approaches were protected by walls (an aqueduct on the north) which shielded other batteries; through the marshy fields in front of these were irrigating ditches, some large and deep, with high banks and sticky bottoms, very serious obstacles to troops and artillery. The one military defect of the castle for modern warfare was the limited force that could effectively use arms within it; the garrison of 800, commanded by Gen. D. Nicholas Bravo, was as large as could well operate there. Along its approaches were some 4,000 to 4,500 more troops, while Scott had 7,500; but Santa Anna dared not strip the other entrances to the city. By the battle of Molinos del Rey (q.v.) on the 8th Scott had carried a set of long stone buildings southwest of Chapultepec and, though under its guns, forming some protection for hostile artillery. On the 12th Captain Huger planted heavy batteries here and at three other places, to range the south and west of the hill, the only accessible portions, on which an assault had been determined; and their fire gradually silenced that from Chapultepec, breached the defenses, and caused much loss. About 8 A.M. on the 13th Scott launched two assaulting columns: Pillow on the west, from Molinos del Rey through the cypress grove, supported by Worth; Quitman against the south, from the heights of Tacubaya, where Scott had his headquarters, supported by Persifer F. Smith's brigade. Preceded by the pioneer companies with ladders, axes, picks, and crowbars, and under a plunging fire, they surmounted all obstacles, cleared the approaches, broke through the walls, climbed the heights, entered the castle gates, and having cut off retreat by the north-western road to Mexico, captured the entire garrison. The approaches and castle had been mined, but the defenders waited too long before exploding the mines, and failed. The next day the American army overcame all remaining resistance and entered the capital. Their loss in these three days was 863 killed and wounded, including Col. T. B. Ransom killed, Pillow and Shields wounded. The Mexican loss was unknown, but certainly as heavy, and included several gallant and brilliant officers; and 823 prisoners were taken, including three generals, one the commandant of the academy. Among the American officers prominently engaged were a remarkable number afterward distinguished in military and civil life: Robert E. Lee, Joseph E. Johnston, James Longstreet, "Stonewall" Jackson, David E. Twiggs, Gideon J. Pillow, D. H. Hill, J. B.

CHAR — CHARCOT

Magruder, Barnard E. Bee, P. G. T. Beauregard, Geo. E. Pickett, Raphael Semmes; George B. McClellan, Silas Casey, E. V. Sumner, Jesse L. Reno, James Shields, I. I. Stevens, Z. B. Tower, William S. Harney; Thomas H. Seymour, John W. Geary, Mayne Reid. Franklin Pierce had been severely wounded at Molinos del Rey. See C. M. Wilcox, 'History of the Mexican War' (1892).

Char, här, Friedrich Ernst (FRITZ), German composer: b. Cleve-on-Rhein 3 May 1805. He is a noted opera conductor, and wrote the celebrated romantic opera, 'The Rogue of Bergen' (Der Schelm von Bergen), besides sonatas and cantatas.

Char, chär, a genus of fishes (*Salvelinus*) of the family *Salmonidae*. They were formerly classified in the same genus as the trout (Salmo), from which they are, however, differentiated by color and by the shape of the vomer. There are several varieties of this fish, all having intense and beautiful colors; length from 10 to 15 inches; weight sometimes as high as two pounds, but generally ranging under one pound. All kinds are held in esteem for the table. They are found plentifully in the deeper lakes of England, Wales, Ireland, and more rarely in Scotland, also in the Lake of Constance and Lake Geneva. The best known American variety is the brook-trout, *S. fontinalis*; there is also a variety found in Maine, known as the Rangeley Lake trout, which is very similar to the European char.

Chara, kä'ra, in botany, a genus of plants, the typical one of the order *Characeæ* (q.v.). The species are found in ponds. In palæontology, the nucules, known under the name of *Gyrogonites*, are found for the first time in the fresh-water beds of the Jurassic (Oolitic) formations. They are the minute spiral seed-vessels or sporangia of these plants.

Characeæ, kä-rä'se-ë, an order of cryptogamous plants, division *Alga*, composed of an axis consisting of parallel tubes, from which the branches are given off in whorls. The axes are either transparent or incrustated with carbonate of lime. The plants inhabit stagnant water, both fresh and salt, beneath which they are always submersed. They are found in almost every part of the world, but are most common in the temperate zone. The fetid odor which many species emit renders the surrounding locality very unhealthy.

Charade, shä-räd', a syllabic enigma, that is, an enigma the subject of which is a name or a word that is proposed for discovery from an enigmatical description of its several syllables, taken separately, as so many individual words. A charade may be called complete if the different enigmas which it contains are brought into a proper relation to each other, and, as a whole, unite in an epigrammatic point. The French excel in this species of literary amusement.

Acting Charades, a kind of entertainment made up of pantomime and dialogue, and improvised by the members of an evening party. The syllables and complete word are meant to be suggested by the various divisions of the piece.

Charadriidæ, kä-ra-dri'i-dë, the plovers, a family of birds of the order *Limicola*, which along with several equivalent groups is sometimes considered as constituting a more extended order, *Charadriiformes*. Even as limited by American ornithologists the family is a large and important one, embracing many genera and species from all parts of the world. They have long, slender legs, with the toes united by a small membrane, the hinder one very small and elevated, or wanting; the tarsus reticulate; the neck short and thick; body stout; plumage compact, with 12 short tail-feathers and very long primary wing-quills; the beak is short and shaped much like a pigeon's. By European ornithologists the limits of the family are extended to include various related groups, especially the snipes (*Scolopacidae*), which then constitute sub-families. See KILLDEER; LAPWING; PLOVER; etc.

Charadrius, ka-räd'ri-üs, the genus to which the plover belongs, forming the type of the family *Charadriidæ*, which includes also the lapwings, dotterels, oyster-catchers, turnstones, sanderlings, etc. (qq.v.).

Charcoal, an impure variety of carbon, prepared from vegetable substances or bones. Wood charcoal consists of wood burned with but little access of air. Billets of wood are built into a heap, which is covered with earth or sand. The heap is fired at openings left near the bottom of the pile, and the gases escape at small openings above. For making fine charcoal, such as that of willow, used in the manufacture of gunpowder, the wood is burned in iron cylinders, or rather retorts, in which a process of destructive distillation removes the volatile hydrocarbons, pyroligneous acid, etc. By this more perfect means the process is accurately regulated. Charcoal is used in the arts as a fuel; as a polishing powder; a table on which pieces of metal are secured in position to be soldered by the blowpipe; a filter; a defecator and decolorizer of solutions and water; an absorbent of gases and aqueous vapors; a non-conducting packing in ice-houses, safes, and refrigerators; an ingredient in gunpowder and fireworks; and in the galvanic battery and the electric light.

Animal charcoal, used largely in sugar-refining and as a disinfectant and filtering medium, is prepared by calcining bones in closed vessels. These are either retorts, similar to those in which coal is distilled for the production of illuminating-gas, or they are earthenware pots, piled up in kilns and fired. Charges of 50 pounds of bones to a pot will require 16 hours of firing. The bones are then ground between fluted rollers, the dust removed, and the granulated material used for charging the filters of the sugar-refiner. The material is used for removing color, feculences, and fermenting ingredients from the syrup.

In medicine charcoal is sparingly used, but is of service in gastric indigestion in which there is much evolution of gas. Charcoal takes up the gas and therefore prevents distention and pain. It has no curative qualities and is solely alleviative.

Charcot, Jean Martin, zhôn mār tăn shär-kô, French physician: b. Paris 29 Nov. 1825; d. 16 Aug. 1893. His specialty was in the treat-

CHARD — CHARES

ment of nervous and mental diseases, and he performed many curious and successful experiments in hypnotism and mental suggestion, in the Salpetriere, where he founded a clinic for the treatment of nervous diseases in 1880. He published several works treating of these subjects.

Chard, the leaves of artichoke (*Cynara scolymus*) covered with straw in order to blanch them and make them less bitter. Beet chards are the leaf-stalks and midribs of a variety of white beet (*Beta cicla*), in which these parts are greatly developed, dressed for the table.

Chardin, shär-dän, SIR JOHN, French Oriental traveler: b. Paris 26 Nov. 1643; d. London 26 Jan. 1713. Before he had reached his 22d year his father, a jeweler, sent him to the East Indies in order to buy diamonds. Chardin lived six years in Ispahan, where he was less engaged in mercantile business than in profound studies and scientific researches, making use of his connections at court for collecting the most authentic information of the political and military state of Persia. He collected the most valuable materials relating to antiquities and history. In 1670 he returned to France, but again left France for Persia, in 1671, taking with him a considerable quantity of precious stones artistically set, exquisitely worked jewelry, etc. He spent 10 years partly in Persia and partly in India. In 1681 he arrived in London, when he received the honor of knighthood. He published the first volume of his 'Travels into Persia and the East Indies,' in London, in 1686. The other volumes were about to follow, when he was appointed minister plenipotentiary of the king of England to the States-General of Holland, and agent of the English East India Company to the same. In 1711 two editions of his 'Travels' appeared. He soon after returned to England. The exactness and truth of his statements, and the extent of his knowledge, have been confirmed by all succeeding travelers, and have been serviceable to Gibbon, Helvetius, and Montesquieu. The best edition of Chardin's 'Travels' is that by Langlès, 1811, in 10 volumes.

Charente, shä-röüt, France, an inland department, formed chiefly out of the ancient province of Angoumois, and deriving its name from the river Charente, by which it is traversed; area, 1,487,447 acres; capital, Angoulême. It is in general uneven, with hills covered with chestnut-trees, sandy plains, meadows, etc. The principal rivers are the Charente, joined by the canal of Poitou with the Vienne, the Dronne, Tardoire, Bandiat, Touvre, and Né. The wines of the department are of inferior quality, and in little request for the table; but they yield the best brandy in Europe. The celebrated cognac brandy is made in the districts of Champagne, Cognac, Jarnac, Rouillac, and Aigre from a grape called the *folle blanche*, which yields a white wine. The red wines furnish an inferior brandy, without the bouquet that distinguishes the genuine cognac. The wine-growers themselves carry on the distillation, each estate being furnished with stills and the necessary apparatus. Excepting brandy and paper, the manufactures of the department are inconsiderable, consisting of sacking, cloth, cordage,

hats, corks, and earthenware. The paper made at Angoulême is said to be the best in France. The department is divided into the five arrondissements of Angoulême, Barbezieux, Cognac, Confolens, and Ruffec. Pop. (1896) 356,236.

Charente, a river in France, rising in the department of the Upper Vienne; flowing west, and emptying into the Bay of Biscay, about 10 miles below Rochefort, opposite the Isle of Oleron; length about 200 miles. It gives its name to two departments, Charente (q.v.) and Charente-inférieure (q.v.).

Charente-inférieure, äñ-fä-rê-ër, France, a maritime department on the west coast, bounded on the north by the department of the Vendée, and on the south by Gironde; area, 2,635 square miles. It comprises parts of the former provinces of Angoumois and Poitou. The principal rivers that traverse or bound the department are the Charente, Gironde, Seudre, Boutonne, and Sèvre Niortaise—all of which are navigable, as well as the canal of Brouage, and that between Niort and Rochelle. The soil is fertile, and well cultivated; and a considerable portion planted with vines. The pastures are good and well stocked with cattle, horses, and sheep. Along the coast are extensive salt marshes. Salt and brandy are the only articles manufactured to any great extent; the oyster and sardine fisheries are also of importance. Capital, La Rochelle. Pop. 453,000.

Charenton-le-Pont, shä-rön-tôn-lè-pôn, France, a town situated about a mile to the southeast of Paris, with which it is connected by rail and tramway, at the confluence of the Marne with the Seine. It has numerous mercantile and manufacturing establishments. The stone 10-arched bridge across the Marne used to be considered as the key to Paris on this side; hence the memorable attacks upon it both in the civil wars of France and in those with foreign enemies. At Petit-Charenton is the celebrated asylum for the insane of both sexes. From its connection with the asylum the town has given several significant popular phrases to the French language, equivalent to the use of Bedlam in English. A person of marked eccentricity is called a "Charenton boarder." Pop. 16,811.

Chares, kä'rêz, the name of two well-known Greeks. The Athenian Chares was the general through whose incapacity the Thracian colony was lost to Athens during the Social war in 358-356 B.C., and who exposed his country to the designs of Persia, by entering for mercenary purposes the service of the revolted satrap, Artabazus. Although recalled in disgrace, Chares was sent in 349 to the aid of Olynthus, and again he returned without having achieved anything. In 340 he commanded the army sent to Byzantium against Philip, again gave evidence of his incompetency, was replaced by Phocion, but once more invested with the supreme command. In 338 the fatal issue of the battle of Chæronea seems to have been mainly due to his ignorance. He was noted for his athletic figure, his profligacy, and his unscrupulous recklessness. Chares, the sculptor, a native of Lindus, Rhodes, flourished toward the close of the 3d century B.C. He was a pupil of Lysippus and the sculptor of the Colossus of Rhodes, one of the "seven wonders of the world," a representation of the Rhodian sun god erected in commemoration of the successful defense of

CHARGE—CHARITABLE TRUSTS

Rhodes against Demetrius Poliorcetes in 303 B.C. See *Colossus*.

Charge, in heraldry, one of the bearings. This may be one of the ordinaries, as they are called, the straight line bearings, as fess or chevron or a much more elaborate figure, as the representation of an animal or the head of one. Sometimes the charge is imposed upon another charge.

In gunnery, charge signifies the quantity of powder used at one discharge of a gun.

In military tactics, charge is the rapid advance of infantry or cavalry against an enemy, with the object of breaking his lines by the momentum of the attack. Infantry generally advances to about 100 yards and fires, then gradually quickens the pace into the charge-step, and dashes at the enemy's lines. Cavalry charges in echelon or column against infantry, which is usually formed in squares to receive the charge.

Chargé d'Affaires, *shār-zhā dāf-fār*, a representative of a country at a less important foreign court, inferior to an ambassador, or a minister, to whom is intrusted all matters of diplomacy. The title is also given to the officer to whom the charge of an embassy is entrusted during the temporary absence of the ambassador or minister plenipotentiary.

Charge of the Light Brigade, *The*, a remarkable military movement at Balaclava, 13 Oct. 1854, made by 600 English soldiers. The Russians were advancing in great strength to cut off the Turkish force from the English. Lord Raglan sent an order to Lord Lucan to advance, and Lord Lucan, not understanding what was intended, applied to Captain Nolan, who brought the message, and Nolan replied: "There, my lord, is your enemy." Lucan then gave orders to Lord Cardigan to attack, and the 600 men rode forward into the jaws of death. In 20 minutes 12 officers were killed and 11 wounded; 147 men were killed and 110 wounded, and 325 horses were slain. The blunder must be shared by Lord Lucan, Gen. Airey, and Capt. Nolan. However, never victory was more glorious to the devoted men, than this useless charge. "It was magnificent, but it was not war." When Lord Cardigan rallied the scattered remnants, and said: "My men, some one has blundered," they replied: "Never mind, my lord, we are ready to charge again, if it is your lordship's command."

Charikar', Afghanistan, a town in the district of Kohistan, 36 miles north of Kabul. It has a trade in the coarse cotton cloths manufactured throughout the district, and in iron, and also a considerable transit trade to Turkestan and central Asia. Charikar is the place of residence of the governor of Kohistan; and duties are levied here on merchandise passing between it and Turkestan. Pop. 5,000

Charing (*chār'ing*) **Cross**, a triangular piece of roadway at Trafalgar Square, forming the titular centre of London, so named from a cross which stood until 1647 at the village of Charing in memory of Eleanor, wife of Edward I. When the queen's remains were brought in 1290 from Grantham to Westminster Abbey, the king accompanied the bier and erected at each stage where it rested a memorial cross. Of the 13 crosses raised, but two beside

that in London remain. The modern cross, erected in 1863, stands on about the same place as the older one, of which it is as nearly as possible a reproduction, its style being the decorated Gothic of Edward's time.

Chariot, a vehicle used in ancient times either for pleasure or in war. According to the Greeks, it was invented by Minerva; while Virgil ascribes the honor to Erichthonius, a mythical king of Athens, who is said to have appeared at the Panathenaic festival, founded by him, in a car drawn by four horses. The ancient chariot had only two wheels, which revolved upon the axle, as in modern carriages. The pole was fixed at its lower extremity to the axle, and at the other end was attached to the yoke, either by a pin or by ropes. The Greeks and Romans seem never to have used more than one pole, but the Lydians had carriages with two or three. In general the chariot was drawn by two horses. Such was the Roman *biga*, but we also read of a *triga*, or three-horse chariot, and a *quadriga*, or four-horse one. In ancient warfare chariots were of great importance; thus we read of the 900 iron chariots of Sisera, as giving him a great advantage against the Israelites. The Philistines in their war against Saul had 30,000 chariots. The sculptures of ancient Egypt show that chariots formed the strength of the Egyptian army. We have also numbers of sculptures which give a clear idea of the Assyrian chariots. These resembled the Egyptian in all essential features. In modern times the name chariot has been given to a kind of light traveling carriage now out of vogue.

Charitable Irish Society, Boston, Mass.; the oldest existing Irish organization in the United States. It was founded 17 March 1737, by a number of Irish Protestants, and has borne on its roll many distinguished people. Among its founders was the father of Gen. Henry Knox, of the Revolution. Gen. Knox, himself, was also a member of the society. It celebrated its centennial anniversary in 1837 with great eclat, among the guests on that occasion being Gov. Edward Everett, of Massachusetts; Mayor Samuel A. Eliot, of Boston; Hon. John P. Bigelow, secretary of state; Hon. Josiah Quincy, Robert Rantoul, Jr., and other prominent men. Andrew Jackson, president of the United States, during his visit to Boston, in 1833, received the society at the Tremont House, that city, and replied to an address from the organization. The society is in a flourishing condition, and is non-sectarian and non-political.

Charitable Trusts. A charitable trust is "a gift, to be applied consistently with existing laws, for the benefit of an indefinite number of persons, either by bringing their minds or their hearts under the influence of education or religion, by relieving their bodies from disease, suffering, or constraint, by assisting them to establish themselves in life, or by erecting and maintaining public buildings or works, or otherwise lessening the burdens of government; a gift to a general public use, which extends to the poor as well as the rich." The things necessary to raise a valid trust are sufficient words to create it, a definite subject, and an object. In charitable trusts the object is generally uncertain, because if described with definiteness it would cease to be a charity and would be governed by

CHARITES — CHARITIES

the ordinary rules of trusts. At one time it was held that charitable trusts were created by an act passed during the reign of Queen Elizabeth, and known as the statute of charitable uses, but it has been shown that these trusts existed long before that act was passed. Charitable trusts are recognized in all of the States of the Union, while a number of the States have never adopted the statute at all. Even where the statute is enforced, trusts while not within the letter, if within the spirit of the statute, are held to be good. Uncertainty of the object is one of the characteristics of a charitable trust, and it has led to what is known as the *cy pres* doctrine, which is that the courts will interpret instruments creating charitable trusts so that if the exact object of the donor cannot be carried out the donation will be applied to something of a nature similar to that specified by the donor.

When a testator leaves property to his executors in such a manner that they are to be the sole judges of its use, and the executors die before the testator, it is doubtful whether the trust will come into existence, as the executors were the only persons who could designate for what the donation was to be applied. In some jurisdictions the rule is that if the property can be applied to other than charitable purposes it is too indefinite.

In cases in which the particular charitable purpose does not exhaust the whole fund, if from the instrument creating the fund, the intention appears that the entire amount is for charity, the surplus will be devoted to some other charity and will not form a resulting trust for the heir or next of kin. A gift may be made to a charity not in existence, and a gift to a specific charity will not fail for want of a trustee.

After the trust has come into existence, if the purpose for which the trust was created fails for any reason, it will be applied to some other purpose of a similar character, so as to fulfil as nearly as possible the purpose for which it was intended.

Charitable trusts are not subject to the rule against perpetuities, which is that property cannot be tied up for more than a life or lives in being and 21 years thereafter. If property left to a charitable trust is limited upon another estate not a charitable trust, and the first estate is in violation of the rule against perpetuities, the trust will not be sustained; but after the trust once comes into existence the rule against perpetuities is not applied to it. In the State of New York charitable trusts are governed by the same rules as any other trust.

By English law all bequests for charitable purposes, to be valid, must be strictly for the public benefit; that is to say, in favor of institutions for the advancement of learning, science, and art; for the support of the poor; or for other objects connected with the welfare of the public; and such bequests include those in favor of the Church or of other religious bodies sanctioned by the law. Bequests for superstitious uses are null and void. A body of commissioners (the charity commissioners), under whose superintendence such benevolent trusts are placed, was established under the Charitable Trusts Act of 1853. They have the power, of

inquiring into the administration of all English public charities. See MORTMAIN.

Charites, *ká'rít* éz, the Greek name of the Graces (q.v.).

Charities, Public. Following in the footsteps of civilization there has come a development of charity, often slowly and haltingly, but ever persistently, until to-day the treatment of its dependent poor is accepted as evidence of the civilization of a community. A glance through history discloses not merely neglect of the defective mentally and physically, by savage and barbarous peoples, but an aggressively cruel policy to rid the community of the burden of their care. Crippled children were left to die and helpless old persons were put out of the way. In contrast to that condition we find in the dawn of the 20th century a settled conviction in all civilized communities that it is as much the duty of the State to care for its dependents as it is to conserve the educational interests of its children. But this change was wrought only by self-sacrificing devotion of charitably inclined students of sociology through centuries of unrelenting labor. So slow, indeed, was the development of the practice of charity that it is well within the last hundred years that the care of the helpless was left to individuals or was treated by society at large as an unreasonable burden on the State. Even after the conviction became permanent that for its own protection, if for no higher reason, the State should assume the responsibility of caring for its helpless classes the conception of its duties were so vague and the method to be followed was so undefined, that the results were eminently unsatisfactory. Society regarded its dependents as being much on the same plane as its criminals and treated them much in the same way. Prisoners, dependent children, sick poor persons, the insane, the epileptics and the helpless aged were huddled together under one department of government and it was not infrequently the case that little or no discrimination was made in their care. General demoralization ensued and it became apparent that a remedy must be found if further progress was to be made in the development of the practice of charity. This remedy was found in segregation. It was clear that not only physical separation but governmental separation of the various classes was necessary. Custom and tradition were hard obstacles to overcome, but the adherents of segregation were not to be denied, and after a long and bitter and often disheartening struggle they won their first victory, in the segregation of criminals. A separate and independent department of government was established for their care, although society retained in a large degree its old habit of regarding its criminals and its dependents in much the same light. But an opening had been made for segregation and its adherents were quick to press their advantage. They next demanded and obtained the segregation of the insane and followed this up by the successful demand for the segregation of epileptics, idiots, dependent children, the sick poor, homeless men and women, and the helpless aged. The aim was not merely to assure to each of these classes distinct physical separation from the others, but to give to each a government of its own so that it could receive the undivided attention and care

CHARITIES

of persons competent to do the work entrusted to them and held directly responsible for that work. So beneficial did the experiment of segregation prove to be that the practice of charity made strides for good after it was adopted far out of all proportion to progress in previous years. Indeed the benefits from segregation are so marked and so convincing that the policy has been extended to different conditions in the same class. This is particularly noticeable in the modern treatment of consumptives, for whom special hospitals are being constructed and special diet prepared. And yet the subject has not been exhausted. It is susceptible of further development and closer application. There is a crying need for it in the care of helpless old persons, in the treatment of whom the causes of destitution and the moral character of the individual should always be considered. The demonstrated advantages of segregation may be summed up in the more intelligent attention that each class receives and in the promise that eventually the choice of persons entrusted with the care of dependents will be made with no other purpose in view than fitness for the position to be occupied. The greatest obstacle to the fulfilment of this promise is politics, but the time will come when the practice of charity will be above all politics, as by right and justice and humanity it should be. But in spite of segregation and in spite of all the other remarkable advances made in charitable work in the last half century, society, in a large part at least, persists in regarding the criminal and the pauper from the same view-points. Manifestly this is unfair and unjust. Poverty is not a crime, and the victims of poverty should not be classed with criminals, even in the public mind. The State has not always recognized this principle. On the contrary, its theory and its practice have been to force the poverty-stricken individual into association with the criminal. It is scarcely more than a quarter of a century ago that convicted criminals wearing the uniform of the penitentiary were employed as nurses in public hospitals. When the force of union labor had driven prisoners as laborers out of the public streets, out of the public parks, off public works, and from every other place where public moneys were expended for the improvement of the general community, prisoners wearing prison garb were retained as workmen in the public charitable institutions. At a time when it would have meant a riot to have placed prisoners to care for the trees in the parks, to clean the cobblestones in the streets, or even to look after the sewers, the sick poor man, the helpless imbecile, and the abandoned child were left in part to the care of convicts. This was done in the name of charity, but it was such a rank injustice to the individual, such a blot on the civilization of the community, that the long-growing and firmly founded conviction of earnest students of sociology rebelled against it and, by energetic insistence won, step by step, a victory over such conditions.

The first great move toward the separation of the dependent poor from criminals was made in the introduction of the trained nurse into the public hospitals. Although that was but little more than a quarter of a century ago, in America, it was potent in its influence, and appealed so strongly to the sense of justice of

all communities that to-day every hospital, public or private, has its corps of trained nurses; and the fact that once the place held by the trained nurse was held by a convict in prison garb, is regarded as a barbaric horror. With the elimination of the convict as a nurse in the public hospitals, the cause of progress and reform was encouraged to extend its efforts to the elimination of prison labor in all public charitable institutions. The battle was not an easy one, but the adherents of reform never wavered. They were confronted by old theories and old customs. Chief among these was that which held that prison labor should be utilized and that inasmuch as the institutions that took care of the sick and the poor had always been associated intimately with those that punished the prisoners, it was economy on the part of the State to utilize the labor of the prisoner in the care of the sick and the poor. Changes of government in public charitable institutions, brought about by changes in political domination, retarded the victory, because new men coming into office had to go over all the ground that had been gone over by their predecessors, and often when they were in a frame of mind to take the necessary step forward, they were replaced by some political change which forced a new man into government, and left him in a like position to that occupied by his predecessor at the beginning of his term of office. But the conviction of the justice of the cause had grown so firmly that it was prepared to overcome all obstacles. It was persistent and insistent. It knew that it was right and it would not acknowledge defeat. The final outcome was that prison labor at the end of the 19th century was practically eliminated from public charitable institutions. The sentiment of communities had forced the powers that had the appropriation of public moneys to increase the appropriations for public charitable institutions to the extent that honest, self-respecting, paid labor, could be employed to care for the sick and the poor in public institutions. With that victory gained, it is not probable that there will ever be a relapse into the practice of using prison labor in any degree in public charitable institutions. The divorce between the prisoner and the pauper to-day is complete in almost every civilized community. Justice and humanity and charity will compel this divorce to stand.

Public sentiment has gone even further than the separation of prisoner and pauper. It has gone deep into the study of the condition of children, looking always to the best chance to develop a dependent child, or a criminal child, into a good citizen. It has recognized that environment is a powerful factor in the development of character, and one of its chief endeavors has been to disassociate the plastic mind of childhood from impressions that would tend to retard reform in a child already started on the downward path, as well as to protect a child not contaminated by vicious surroundings from influences tending to contaminate it. The crowning work of this endeavor has been the establishment of children's courts, wherein the cases of children charged with crime are tried, free from even the sight of adult criminals. Further than this, it has been brought about that the adult pauper and the dependent child

CHARITIES

are segregated through the agency of established bureaus for the care of dependent children, protecting them from contact with adult paupers.

The theory and practice of modern charity does not stop with the treatment of conditions as they are found. It has gone deep into the subject and has found that in past ages, too much attention has been given to effect and too little to cause. It recognizes that if a poor man falls ill, it is economy on the part of the State to make him well in as short a time as possible, not only that he may not be a burden in the hospital, but that he may return to the support of his wife and family. To this end, it has built more and better hospitals for his care. It has looked into the causes that led to his sickness, and having found these in wretched dwellings and unsanitary surroundings, it has, through the agency of tenement house reform, sought to bring about conditions of living that, in a great measure, will prevent sickness. It is recognized that it is economy on the part of the State, to take a homeless and friendless child and give it a good physical foundation for a healthy mind in a healthy body. It is recognized that the morally imperfect child should be taken in hand as soon as possible and trained under moral influences, so that the imperfection may be removed. To bring this about, sociology has not been satisfied with the mere treatment of the child as it was found, but it has studied the origin of the child and has sought to remove the causes that produced such results, in order that other similar results should not have to be treated by the State. Out of this theory and practice, have grown day nurseries, kindergartens, manual training schools, and numerous other similar institutions, supported by public or private charity, all striving to remove evil influences and replace them with good influences. Not only do the day nurseries take care of children while their mothers work, but they teach the mothers how to care for the children physically and morally. Kindergartens give the first rudiments of education, and manual training schools lay the foundation for useful occupations. These institutions, by suggestion and encouragement, increase the sense of responsibility on the part of parents, and thus render a priceless service to the community.

In the broadest sense, all men may be said to need help. Interchange of service is a necessity in the economic structure. Charity is not confined to the mere giving of alms. At some time or other in his experience, every man has felt the need of a helping hand. He may not have needed money, but he has needed advice, or kindness, or sympathy. At some time or other, everyone has felt the need of something from another, and the filling of that need is charity. It may be sometimes indefinable, but it exists, and the realization of its existence has caused the development of that vast system of help in civilized countries which is designated by the general term charities. The impulse to relieve distress is almost universal, but how to give and when to give is a problem that must be seriously considered, for it is not infrequently the case that giving does harm. The first appeal for alms is always the most difficult. No person ever asked for alms with-

out, in the first instance, feeling a loss of self-respect. The second asking is easier than the first, and the third than the second, and so on until finally a beggar, without self-respect, is made. It were better in many instances to have refused the first appeal, and thus thrown the applicant back upon his own resources to meet the emergency that confronted him. It were better in almost all instances to refuse the appeal unless some satisfactory investigation has been made as to the real condition of the applicant. This is particularly true in communities where institutions are provided for the immediate relief of the needy. In most of the great municipalities, there is no need for any one to go without food or shelter, for food and shelter are provided by the State, and are to be had for the asking. It is a recognized truth that the poorest people are the most charitable. This is due to two causes. The first is, that a poor person understands from his own experience what another poor person suffers. The second is that by the force of circumstances poor people live in close juxtaposition, and are subject to the appeals of their neighbors. Out of this comes neighborly charity, which is probably the best form of charity, because there is less chance of imposition, on the one hand, and of unnecessary help, on the other. It is less mistaken than any other form of charity. It finds expression in innumerable ways. The tenement-dweller knows of the want of his neighbor, and gives him a share of his own necessities. The physician recognizes the impecuniosity of his patient and gives his services free. The retail dealer in his little shop knows the financial condition of his customers and extends credit. The lawyer sometimes makes no charge for his services. The landlord is not insistent on the immediate payment of his rent. The employer often advances wages before the work is done. Neighborly charity takes a hundred other forms and rarely makes a mistake, because the one who lends the helping hand knows the recipient is worthy of it. It is sound and sensible and is the most beautiful form of all charity. But there comes a time when, by demonstrated unworthiness, or continued helplessness, an object of charity breaks the patience or exhausts the resources of the neighborhood, and has to reach out for aid from others. Then it becomes necessary for some organized charity to exert itself. The Church is a powerful organization in extending charity. Churches of all denominations have always looked after their poor and helpless; and the Church is really the first organized charity. But the question arises as to whether, after all, it is not the duty of the community as a whole, rather than that of the Church, to care for the poor. It is well for the Church to do all that it can, but the fundamental responsibility for the care of the poor rests upon the community. Whatever the Church does lessens the burden upon the State, but the conviction has grown that the State is responsible, and should be held responsible, and this may be said without in any degree lessening the responsibility that any church may feel for the care of its own. Churches are powerless to supply universal co-operation, because of their individual limitations, but they can assist and do assist in a general organization of charity.

CHARITIES

Out of this feeling of the necessity for general co-operation in charity, organized charity has grown. To every student of sociology, the conviction comes that organization is necessary in the distribution of charity. The first step in this direction was the formation of relief societies, designed to replace indiscriminate alms-giving by individuals, and intended to increase the funds available for the help of classes that might have been neglected. Then followed the associations for improving the condition of the poor, which were not to deal in relief except in so far as relief might tend to the permanent elevation of those relieved. The relief societies increased in numbers, but the organizations for the improvement of the condition of the poor have generally lost sight of the fundamental purpose of the organization, and have developed into mere relief societies. Neither filled the want, and so a third form of organized charity came into existence. This is designated as "The Charity Organization Society."

The first thing done by the Charity Organization Society is to investigate. On this point, the evidence of Edward T. Devine, Ph.D., general secretary of the Charity Organization Society of the city of New York, may be taken as authoritative. He says in his book, 'The Practice of Charity':

In modern organized charity, investigation has come to mean something more than it had meant for those who had proclaimed the necessity for discriminating between the deserving and the undeserving. Investigation is not solely or even primarily for the purpose of thwarting the expectations of impostors. It is not even merely a device for preventing the waste of charity upon unworthy objects, in order that it may be used for those who are really in need. Investigation is rather an instrument for the intelligent treatment of distress. It is analogous to the diagnosis of the physician who does not attempt to treat a serious malady from a glance at its superficial indications, but who carefully inquires into the hidden and early manifestations of the disease, and seeks to know as much as possible of the complicating influences with which he must reckon in effecting a cure. Investigation, therefore, while it should never be inconsiderate or blundering, or heartless, must be painstaking, conscientious and honest. This kind of an investigation has been developed as one feature of organized charity and its possibilities have been only gradually unfolded, and they are realized only gradually in the experience of individual workers. A bad investigation may be too full or too meagre, or it may be neither. The investigation is made not for its own sake, but as a necessary step in the careful remedy of the defects or misfortunes that have brought the applicant to seek relief. In the majority of cases, if the investigation is wise and complete, it will reveal personal sources and facts which will enable the situation to be met without calling in outside aid, and in this way, in the large proportion of instances, investigation might be said to become a substitute for relief.

The Charity Organization Society not only insists on investigations, but on co-operation. On this point, Mr. Devine has this to say:

By co-operation is meant not merely agreement among various societies and organized agencies, upon general plans of co-operation, but rather co-operation in dealing with individual cases of distress upon the basis of facts as ascertained by investigation. It involves, in other words, acceptance of the plan of relief which is calculated to remedy the defects or to supply the deficiencies that have been discovered. This may mean that each of the co-operating individuals or societies shall supplement the efforts of the others by contributing part of the money or work needed, or it may mean that they will agree to a division of the work, each leaving to the other the part for which its facilities are adapted; or it may mean a division of the cases to be dealt with, each

agreeing to leave entirely to the other such classes of individuals or families whose needs are to be studied and adequately met by the agency to which they are assigned. One of the simplest forms of co-operation is that between the Church and the relief agency, secured by either directly from the other in the case of a given family, or secured by the agent of the Charity Organization Society from both. In this case, the material needs should be supplied by the relief agency, and the Church should provide the necessary spiritual oversight and the necessary formative influences for the children, and, if necessary, reformatory influences for older members of the family. It sometimes happens that the family has no need of reformation; that it contains within itself all the necessary resources for education and training, while the financial income alone is lacking, or not sufficient. Even in such circumstances, another friend may not be unwelcome in sickness or in trouble and in periods of unusual difficulty. Enlargement of social opportunities may all be entirely appropriate.

In order to carry out a scheme so comprehensive as this, a machine was necessary, and charity organization made a machine, not merely to investigate objects of charity and to promote co-operation among all charitable agencies, but to keep a record of all work done in charity, and to employ individuals, competent and trained, to do that work. It has even gone further, and is agitating the possibility of establishing a school for workers in charity, whose ultimate purpose is to receive pay for charitable work. Organized charity, by its insistence upon co-operation and by its intelligent discussion of all matters pertaining to charity, exerts a powerful influence upon the State in its relation to charity. There can be no step backward by the State in its treatment of its dependents, which organized charity will not at once detect and seek to stop. The experience of its years of struggle to benefit the poor must be learned by officials having charge of public charitable institutions, and must be practised by them. The good done by organized charity is not confined to the relief that it gives individuals, or to the fraud that it detects, or to the imposition that it prevents, but it extends to the making of public opinion about charitable matters which forces good government in public charitable institutions. The problems of charity are many and difficult, and humanity has been wrestling with them through the ages, but the sum total of the effort of man to help man, while not wholly satisfactory, is eminently encouraging.

The answer has been made with varying degrees of satisfaction to the question as to what should be done with the insane, the sick poor, the dependent child, the imbecile, the epileptic, and to almost every other class, save one, and that is the adult pauper. This is the hardest of all charitable problems. The old person who is destitute, who is driven to ask and to expect public alms, is practically hopeless under existing conditions. He is a dead leaf fallen from the tree of life, swept away into a corner with a heap of others to await dissolution. There ought to be some greater discrimination in the treatment of adult paupers. Indeed, there ought to be some means of saving certain persons destitute in their old age from the demoralization and degradation of living in public institutions at public expense. The influences that drive an individual into an almshouse ought to be considered in his treatment after he is received there. The man who has tried all his life to be respectable and

CHARITIES

independent and has failed, through no lack of effort on his own part, should not be compelled to associate in his last days with the utterly demoralized and vagabond type, that never made an effort to be better than it is. The individual that still preserves some remnant of self-respect should not be compelled to associate with those that have lost all self-respect. Indeed, there are certain persons compelled in their old age to accept public charity that ought not to be sent to an almshouse at all. This idea has been grasped with more or less vagueness in all civilized communities, and efforts have been made to put it into practice. England has made some study of the subject, and Germany has gone so far as to put into practice a scheme to prevent helplessness and resourcelessness in old age. The German scheme compels each man to save during the time that he is able to work, something of his earnings, so that he shall not be destitute when he is no longer able to work. It is really compulsory insurance. German authorities claim that it has worked advantageously, and from the point of view that it has saved some men from destitution in their old age, this cannot be denied. The difficulty about the scheme is, that it may transfer the burden from one class to another. The wages paid for labor in Germany, as in other countries, are not superfluous. Any plan to take away the wages of a working man from his daily necessities, merely to give him a pension when he is old, is not satisfactory unless it can be demonstrated that his wage is in excess of his necessities. It is not charitable to deprive a man of his immediate necessities in order to meet future necessities. It is worse than uncharitable to deprive a man's family of their necessities in order to prevent him from becoming a charge on the community in his old age. It were better to let him use his wage, even all of it, to protect and develop his family, even if the more prosperous members of the community should have to support him in his old age by general taxation. Moreover, there will always be a class, in spite of any system of compulsory insurance, which will not qualify to profit by a pension. There are a thousand causes to prevent a man from going into an insurance scheme, as well as to cause him to drop out of it after he has gone into it; sickness, loss of employment, starvation wages, matters over which he can have no control, will interfere to deprive him of the benefits of such insurance. What is to be done with him then? He must still be taken care of. Therefore, Germany's experiment of compulsory insurance does not solve the problem satisfactorily. The most radical and progressive step taken in the care of the adult pauper was made by New Zealand some five years ago. In the preamble of the Old Age Pension Act, passed by the New Zealand parliament in 1898, these words occur:

It is equitable that deserving persons who, during the prime of life, have helped to bear the public burdens of the colony by the payment of taxes, and to open up its resources by their labor and skill, should receive from the colony a pension in their old age.

There is no suggestion of charity in this proposition. It is a demand for justice and right. There is nothing said about relief from the burden of the care of these people in their

old age, or that it is humane and kindly and charitable to care for them; but the claim is made that it is theirs by right and they ought to have it. On this ground, and this alone, do the New Zealanders, in their legislation, propose to make old age not only comfortable, but honorable in their community. The suggestion here is not one of charity, but of gratitude. The act was passed and is in full operation in New Zealand, but it is too early yet to say what the result will be. By the New Zealanders it is regarded as an experiment. But whatever the result may be, it has at least sounded a new note in the treatment of the aged poor, which is certain to receive an answering echo in the hearts of all who believe in justice.

It may be urged that the New Zealand plan discourages frugality and encourages paternalism. The man who knows that the State is going to take care of him when he shall have reached a certain age, will not make as great an effort to prosper as the man who knows that his comfort in old age will have to depend upon the fruits of the labor of his youth and full manhood; and there must still be those in every community, even in New Zealand, who do not come under the preamble of the Old Age Pension Act of New Zealand, for there are those who have never helped to bear the public burdens by the payment of taxes, or to open up the resources of the country by their labor and their skill. These, fallen into destitution in their old age, must be taken care of in some way. If they are to be taken care of outside of the Old Age Pension Act, then it does not answer the question. If they are to be included in the Pension Act, in spite of their non-productiveness, then the man who is worthless as a member of the community is treated on the same plane as the one who is worthy, and a premium is placed on worthlessness. There ought to be some better solution of this problem of caring for the respectable destitute person than that contained in either the German insurance scheme or the New Zealand Old Age Pension Act. There is no doubt that the community owes something to an individual who has worked all his life. Such a person should not be sent to the almshouse when he can work no longer. He should be able to go to the treasury of the community, not as an applicant for alms, but as a claimant for his own, and say, "The fruit of my labor is shown in the general prosperity of this community. Certain conditions have interfered with my sharing in that prosperity sufficiently to protect me from want in my old age, but by right and justice a share is mine, and I have come to collect it." At least enough to keep him supplied with the necessities of life should be at his command on the establishment of his rightful claim to it, and there should be no difficulty in his getting it. Just how this can be done is a problem for students of sociology. New Zealand has taken a novel step, and the world is watching the outcome. It is not a question of charity, but a question of right, growing out of charity, and the answer will come, even as all the other answers to difficult problems in relation to the human race have come, through the best, the most disinterested, and the most earnest thought of the world.

JOHN W. KELLER,
Ex-Com. of Charities, New York.

CHARITON—CHARLES THE GREAT

Chariton, kǎr'i-tōn, Greek prose writer: fl. 5th or 6th century A.D. He was the author of a romance which describes the loves and adventures of Chæreas and Callirrhoe. Critics generally think that the birthplace usually assigned to the author is fictitious, and that it is by no means certain that he was a native of Aphrodisias in Caria. The romance was first published with a learned commentary by D'Orville (3 vols. 4to, Amsterdam 1750), from a MS. in Florence, the only one yet known.

Chariton, chār'i tōn, Iowa, city and county-seat of Lucas County, situated on the Chariton River, and on the Chicago, B. & Q. R.R. It has several manufacturing interests, including flour-mills, carriage factories, and manufacturing of agricultural implements. Pop. (1900) 3,989.

Charity, one of the three great theological virtues, consisting of love to God and to men, or the disposition to love God with all our heart and our neighbor as ourselves. In a narrower sense, it signifies kindness and goodwill toward mankind in general, and in a still narrower sense, the giving of alms and the alms itself. Organized charity is the system of poor relief carried out by bodies of a quasi-public character, such as the Charity Organization Society in New York. See PUBLIC CHARITIES.

Charivari, shā-rē-vā-rē, a term used especially in France to denote a mock serenade of discordant music with such accompaniments as tin kettles, shouting, whistling, groaning, hissing, and screaming, and the like, meant for the annoyance and insult of an obnoxious person. The etymology of Charivari is obscure; the Germans translate it by *Katzenmusik*, to which in English-cat's-concert, and the American callithumpian concert, correspond. In France, during the Middle Ages, a charivari was generally raised against newly married persons, especially those married for the second time. The term is now sometimes applied to periodicals which ridicule the government's policy and public men.

Charju'i, Bokhara, a town situated on the river Oxus at the point where it is crossed by the railway from Bokhara to the Caspian Sea. Owing to its position it has considerable commercial importance.

Charlemagne, shār'lē-mān. See CHARLES THE GREAT.

Charlemont (shār-lē-mōn) and **Givet**, zhē-vā, France, a fortified stronghold in the department of the Ardennes. The works occupy both banks of the Meuse, about 25 miles above Namur, at the junction of several roads, on a steep mountain, and completely command the river. They consist of four fortresses, two of which, Charlemont and Great Givet, lie on the left bank of the Meuse, and the other two, Little Givet and Mont d'Haur, upon the right. The fortification is calculated for a garrison of 11,000 men, but in case of necessity can contain 25,000, and may be defended by 3,000 to 4,000. The castle and small town of Charlemont were built in 1555 by Charles V. Louis XIV. enlarged it by fortifying the small town of Givet, which lies at the foot of the hill, and by increasing the fortifications of Charlemont. The Givets and Mont d'Haur capitulated to the Prussians in

1815, but Charlemont, which is almost impregnable, was not taken.

Charleroi, shār-lē-rwā, Belgium, a town in the province of Hainaut, on both sides of the river Sambre, 20 miles east-northeast of Mons, the low town standing on the right and the middle town and high town on the left bank. The only public building of importance is the parish church, which was built by Louis XIV. Charleroi possesses a college, an academy of design, a hospital, and several schools. It stands in a densely populated district with productive coal and iron mines, which have given rise to flourishing industries; it may be considered the centre of the Belgian iron trade. It was fortified by the Spaniards in 1666 and named for Charles II. of Spain. Taken by the French in November 1792, was recovered by the Austrians in June 1793, but it again surrendered to the French in July 1794. Pop. 25,000.

Charleroi, shār-lē-ro'i, Pa., city of Washington County, on the Monongahela River and on the Pittsburg, V. & C. R.R. Over \$2,000,000 of capital is invested in the manufactures here, which include glass-works of various sorts. Pop. (1900) 5,930.

Charles Martel, king of the Franks: b. about 689 A.D.; d. 22 Oct. 741. He was a son of Pepin Héristal (mayor of the palace under the last kings of the Merovingian dynasty). His father had governed under the weak kings of France with so much justice, and so much to the satisfaction of the people, that he was enabled to make his office hereditary in his family. Chilperic II., king of the Franks, refusing to acknowledge Charles Martel as mayor of the palace, the latter deposed him, and set Clothaire IV. in his place. After the death of Clothaire he restored Chilperic, and subsequently placed Thierry on the throne, showing how absolute was the control of the mayor, and that the royal dignity was a mere phantom. Charles Martel rendered his reign famous by the great victory which he gained in October 732, over the Saracens, near Tours, from which he acquired the name of Martel, signifying hammer.

Charles the Great, or **Charlemagne** (CAROLUS MAGNUS), king of the Franks, and subsequently emperor of the west: b. probably at Aix-la-Chapelle 2 April 742; d. there 28 Jan. 814. His father was Pepin the Short, king of the Franks, son of Charles Martel. After the decease of his father, in 768, he was crowned king, and according to the wish of Pepin divided the Frankish dominions with his younger brother, Carloman; but the conditions of this partition were several times altered, without being ever adjusted to the satisfaction of the parties. Their mutual discontent was fostered principally by the king of the Lombards, Desiderius (the father-in-law of both princes), because Charlemagne had repudiated his wife. Desiderius sought revenge for the rejection of his daughter by exciting and encouraging commotions in the realm, in which he was assisted by the circumstance that the nobles aspired to independence. The people of Aquitania were the first who attempted to become independent. Charlemagne marched against them with rather a small army; but he relied on the assistance of his brother, Carloman, to whom a portion of Aquitania then belonged. Carloman appeared, indeed, on the field, but at the decisive moment

CHARLES THE GREAT

deserted his brother, who was obliged to sustain alone an unequal conflict. His great courage and conduct, after a long and doubtful contest, procured him the victory, and the insurgents submitted (770). At Carloman's death in 771, and after the flight of his wife and her two sons to her father in Italy, Charlemagne made himself master of the whole empire, the extent of which was already very great, as it embraced, besides France, a large part of Germany. He now formed the plan of conquering the Saxons, for which his zeal for the diffusion of Christianity served him as a pretence. The Saxons, in possession of Holstein and Westphalia, preferred pillaging to peaceful occupations, and a wandering to a settled mode of life. An irruption into the territory of the Franks was the alleged cause of the first war which Charlemagne began against them in 772. The other wars were produced by the rebellions of this warlike nation, which was never reduced to complete submission till the peace of Seltz, in 803, after it had embraced Christianity. A part of the Saxons Charlemagne removed to Flanders and Switzerland, and their seats were occupied by the Obotrites, a vandal tribe in Mecklenburg. The famous pillars called *Irmensäulen* were destroyed as monuments of pagan worship. During 32 years did the Saxons resist a conqueror who, striving with equal eagerness to convert and to subdue them, never became master of their country till he had transformed it almost into a desert. They might have made a more successful defense had they not been distracted by internal dissensions. The most celebrated of their leaders was Wittikind, and next to him Albio, who finally embraced Christianity in 783.

While he was combating the Saxons on the banks of the Weser, Pope Adrian implored his assistance against Desiderius, who had torn from him the exarchate of Ravenna, which Pepin the Short had presented to the holy see, and who was urging the Pope to crown the nephews of Charlemagne, that Charlemagne himself might be considered a usurper. Charlemagne immediately left Germany and marched with his army to Italy. Desiderius fled to Pavia, which was bravely defended by the Lombards. The city finally fell, and Desiderius, with the widow and sons of Carloman, were carried prisoners to France. Desiderius ended his life in a monastery. In 774 Charlemagne was crowned King of Lombardy with the iron crown.

In 778 he repaired to Spain to assist a Moorish prince, conquered Pampeluna, made himself master of the county of Barcelona, and spread the terror of his name everywhere. But on his return his troops were surprised in the valley of Roncesvalles by some Saracens, in connection with the mountaineers, the Basques, and the rear-guard defeated; remarkable from the circumstances that Roland, one of the most famous warriors of those times, fell in the battle. (See RONCESVALLES.) The disaffection of the tribes of Aquitania induced Charlemagne to give them a separate ruler: for this purpose he selected the youngest of his sons, Louis (called *le Débonnaire*). The Lombards were no less turbulent, and the Greeks made incessant efforts to reconquer Italy; and the nobles to whom he had intrusted a part of the sovereignty of this country, evinced little fidelity. He therefore gave them his second son, Pepin, for a

monarch; his eldest son, Charles, remaining constantly with him, and assisting him in his manifold undertakings. In 781 he caused these two sons to be crowned by the Pope in Rome, hoping to render the royal dignity inviolable in the sight of the people. Charlemagne had another son, also called Pepin, who was the oldest of all his children, being the son of his divorced wife. This circumstance probably inspired the monarch with an aversion to the elder Pepin, and prevented him from admitting him to a share in the government.

After returning from Spain Charlemagne was again obliged to take the field against the Saxons. The year 790, the 22d of his reign, was the only one which he passed without taking up arms. As his power increased, he meditated more seriously the accomplishment of the plan of his ancestor, Charles Martel, to restore the Western Empire. On Christmas Day (800) he was proclaimed Cæsar and Augustus by Pope Leo III.; he was invested with the ornaments of the ancient Roman emperors, and the only thing forgotten was, that the empire could not subsist long in a family where the authority was, by law, divided among the children of the deceased monarch. Pepin, king of Italy, died in 810, and his death was followed the next year by that of Charles, the eldest. Thus of his legitimate sons only one remained, Louis, king of Aquitania, whom Charlemagne adopted as his colleague in 813. He was buried at Aix-la-Chapelle, his favorite and usual place of residence. He was deposited in a vault, where he was placed on a throne of gold, in full imperial costume. The sepulchre was sealed, and over it was erected a kind of triumphal arch, on which were the words, "Here lies the body of Charles, the great and orthodox emperor, who gloriously enlarged, and for forty-seven years happily governed, the empire of the Franks."

Charlemagne was a friend of learning; he deserves the name of restorer of the sciences and teacher of his people. He attracted by his liberality the most distinguished scholars to his court; among others, Alcuin, from England, whom he chose for his own instructor; Peter of Pisa, who received the title of his grammarian; and Paul Warnefried, better known under the name of Paulus Diaconus, who gave the emperor instruction in Greek and Latin literature. By Alcuin's advice, Charlemagne established an academy in his palace at Aix-la-Chapelle, the sittings of which he attended with all the scientific and literary men of his court—Leidrades, Theodulphus, the archbishops of Trèves and Metz, and the Abbot of Corvey. All the members of this academy assumed names characteristic of their talents or inclinations. One was called Dametas, another Homer, another Candidus; Charlemagne himself took the name of David. From Italy he invited teachers of the languages and mathematics, and established them in the principal cities of his empire. In the cathedrals and monasteries he founded schools of theology and the liberal sciences. He strove assiduously to cultivate his mind by intercourse with scholars; and, to the time of his death, this intercourse remained his favorite recreation. His mother-tongue was a form of the Teutonic, but he spoke several languages readily, especially the Latin. He was less successful in writing, because he had not applied

CHARLES

himself to it till he was further advanced in years. In the winter he read much, and even caused a person to read to him while he took his meals. He endeavored to improve the liturgy and church music. He was desirous of introducing the Roman liturgy into his states; but the clergy, who clung to the ancient usages, offered some resistance. Several churches, however, complied with the wish of the monarch, and others mingled the Roman and Gallican liturgy. He attempted to introduce uniformity of measures and weights, but was unable to accomplish his design. Another great plan of his was to unite the Rhine with the Danube, and consequently the Atlantic with the Black Sea, by means of a canal. The whole army was employed on the work; but its accomplishment was prevented by want of knowledge of hydraulic architecture. The arts, however, under his patronage, produced other monuments of his fame. The city of Aix-la-Chapelle received its name from a splendid chapel which he caused to be built of the most beautiful Italian marble. The doors of this temple were of bronze, and its dome bore a globe of massive gold. The imperial palace was built in the highest style of splendor. Charlemagne also erected baths, in which more than one hundred persons could swim in warm water. He was himself very fond of swimming, and frequently used these baths, with all the nobles of his court, and even with his soldiers. At Seltz, in Alsace, he had a no less splendid palace. To Charlemagne France is indebted for its first advances in navigation. He built the lighthouse at Bologne, and constructed several ports. He encouraged agriculture, and made himself immortal by the wisdom of his laws. Thus his law *de villis* is esteemed a monument of his views on rural economy. His fame filled even the East. He received ambassadors from the patriarch of Jerusalem, from the Emperors Nicephorus and Michael, and was twice complimented with embassies from Harun al-Rashid, the famous caliph of Bagdad, all of which he received with a splendor unexampled even in the East. He convened councils and parliaments, published capitularies, wrote many letters (some of which are still extant), a grammar, and several Latin poems. His empire comprehended France, most of Catalonia, Navarre, and Aragon; the Netherlands, Germany as far as the Elbe, Saale, and Eyder, Upper and Middle Italy, Istria, and a part of Sclavonia.

In private life Charlemagne was exceedingly amiable: a good father and generous friend. His domestic economy afforded a model of frugality; his person, a rare example of simplicity and greatness. He despised extravagance of dress in men, though, on solemn occasions, he appeared in all the splendor of majesty. His table was very plain. He was large and strong; his height, according to Einhard, equaled seven times the length of his foot. His head was round; his eye large and lively; his nose of more than common size; his countenance had an agreeable expression of serenity. His gait was firm; his bearing manly. He enjoyed perfect health till the last four years of his life, when he was attacked by fevers, and began to limp. In summer he was accustomed to repose for two hours after dinner, but at night he slept uneasily. He wore the dress of his coun-

try; on his body a linen shirt, over which was a coat with a silk border, and long breeches. For his outer dress he wore a cloak, and always his sword, the hilt and belt of which were of gold and silver. He possessed a natural, impressive eloquence, and in his expression of countenance there was something to excite respect, united with gentleness and kindness. See Einhard, 'Vita Caroli Magni'; Gaston Paris, 'Histoire Poétique de Charlemagne' (1865); Guizot, 'Charlemagne and the Carolingians' (1880); Brosien, 'Karl der Grosse' (1885); Mombert, 'History of Charles the Great' (1888); Burr, 'Charlemagne' (1888); Hodgkin, 'Charles the Great' (1897); Dairs, 'Charlemagne' (1900).

Charles I., king of Great Britain and Ireland: b. Dunfermline, Scotland, 19 Nov. 1600; d. London 30 Jan. 1649. He was the third son of James VI. and Anne of Denmark. Soon after the birth of his son James succeeded to the crown of England, and on the death of Prince Henry in 1612, Robert, the second son, having died in infancy, Charles became heir-apparent, but was not created Prince of Wales till 1616. Little is recorded of him previous to his romantic journey into Spain in company with Buckingham, in order to pay his court in person to the Spanish infanta. Through the arrogance of Buckingham this match was prevented, and the prince was soon after contracted to Henrietta Maria, daughter of Henry IV. of France. In 1625 he succeeded to the throne on the death of his father. The first Parliament which he summoned, being much more disposed to state grievances than grant supplies, was dissolved; and by loans and other expedients an expedition was fitted out against Spain which terminated in disgrace and disappointment. In the next year a new Parliament was summoned, and the disgust and jealousy prevailing between the king and this assembly laid the foundation of the misfortunes of his reign. The House of Commons held fast the public purse, and he intimated a design of following new counsels should they continue to resist his will, and suddenly and angrily dissolved them, after a short session, while they were preparing a remonstrance against the levying of tonnage and poundage without consent of Parliament. Charles then began to employ his threatened mode of raising funds by loans, benevolences, and similar unpopular proceedings; which, however partially sanctioned by precedent, were wholly opposed to the rising notions of civil liberty, and to the constitutional doctrine which rendered the Commons the guardian and dispenser of the public treasure. His difficulties were further increased by a war with France, intended to gratify the private enmity of Buckingham, who added to the odium against him by an ill-fated expedition to assist the Huguenots of Rochelle.

In 1628 the king was obliged to call a new Parliament, which showed itself as much opposed to arbitrary measures as its predecessor, and after voting the supplies prepared a bill called "A Petition of Right, Recognizing all the Legal Privileges of the Subject," which, notwithstanding the employment of all manner of arts and expedients to avoid it, Charles was constrained to pass into a law.

CHARLES

The assassination of Buckingham soon after by Felton removed one source of discord, but the Parliament which met in January 1628 manifested so determined a spirit against the king's claim of levying tonnage and poundage by his own authority, that it was suddenly dissolved, and Charles was determined to try to reign without one. For this purpose, having judiciously terminated the pending wars between France and Spain, he raised Sir Thomas Wentworth, afterward so celebrated as Lord Strafford, to the principal place in his councils. This able statesman had begun his political career in opposition to the court, but having been gained over, was by his austerity, talent, and firmness, an exceedingly fit instrument to curb the spirit of resistance to prerogative, which had become so strong among the Commons. In ecclesiastical affairs Charles, unhappily for himself and the Church, was guided by the counsels of Laud, then bishop of London, a prelate whose learning and piety were accompanied by a zeal as indiscreet as intolerant.

Under these counsels about 11 years passed away in the execution of plans for raising money without the aid of Parliament, with other dangerous expedients. The arbitrary courts of high commission and star chamber, in the hands of Laud, also exercised in many instances the most grievous oppression. In 1634 ship money began to be levied, which being strictly applied to naval purposes, the nation at large acquiesced in it with less than usual repugnance; and some writers, who courageously attacked the court against the principle, were treated with so much severity that others were deterred from following their example. So desperate did the cause of liberty at this time appear, that great numbers of the Puritans emigrated to New England, and by order of the court a ship was prevented from sailing, in which were Sir Arthur Hazelrig, John Hampden, and Oliver Cromwell. It was in 1637, not long after this remarkable event, that Hampden commenced the career of resistance by refusing to pay ship money, the right to levy which, without authority of Parliament, he was determined to bring before a court of law. His cause was argued for 12 days in the court of exchequer; and although he lost it by the decision of 8 of the judges out of 12, the discussion of the question produced a very powerful impression on the public mind.

It was in Scotland, however, that formal warlike opposition was destined to commence. From the beginning of his reign Charles had endeavored to introduce into that country a liturgy copied from the English—an innovation which produced the most violent tumults, and ended in the formation of the famous "Covenant" in 1638, by which all classes of people mutually engaged to stand by each other. The Covenanters levied an army, which the king, opposed by an ill-disciplined English force, so equivocally inclined, that, not able to trust it, Charles agreed to a sort of pacification. His finances being exhausted, after an intermission of 11 years he again assembled a Parliament, which, as usual, began to state grievances previous to granting supplies. Losing all patience, the king once more hastily dissolved it, and prosecuted several members who had distinguished themselves by their opposition. Raising money in the best manner he could devise, an English army was again made to proceed

toward the north; but, being defeated by the Scots, it became obvious that affairs could no longer be managed without a Parliament, and in 1640 that dreaded assembly was again summoned, which proved to be the famous Long Parliament, whose career forms so memorable a portion of English history. Charles soon found himself obliged to be a comparatively passive spectator of the ascendancy of the democratic portion of the Constitution, and was obliged, both in Scotland and in England, to yield to the torrent which assailed him.

In the meantime a flame burst out in Ireland, which had no small effect in kindling the ensuing conflagration at home. The oppressed Roman Catholic population of that country, during the confusion of the times, rose against the government for the purpose of regaining their rights. Very exaggerated accounts of the massacre of the Protestants are given by several of the historians. Later writers have established the fact that the number who perished in this insurrection was not great.

The Parliament being summoned, the king left the conduct of the war entirely to it; but it now became evident that the Commons intended systematically to pursue their advantages, and to reduce the crown to a state of complete dependence. They framed a remonstrance containing a recapitulation of all the errors of the reign; renewed an attempt for excluding bishops from the House of Lords; passed ordinances against superstitious practices and so inflamed the popular odium against the Episcopal orders as to intimidate its members from attending to their duty in Parliament.

At length, it being apparent that either zealous adherents of prerogatives, or those anxious to establish the government on a more democratic basis, must give way, Charles caused his attorney-general to enter, in the House of Peers, an accusation against five leading members of the Commons, and sent a sergeant-at-arms to the House to demand them. Receiving an evasive answer, he, the next day, proceeded himself to the House, with an armed retinue, to seize their persons. Aware of this intention, they had previously withdrawn; but the king's appearance with a guard caused the House to break up in great disorder and indignation. The accused members retired into the city, where a committee of the House was appointed to sit, and the city militia was mustered under a commander appointed by Parliament, which also demanded the control of the army. Here the king made his last stand, the matter having now arrived at a point which arms alone could decide. The queen fled to Holland to procure ammunition, and Charles, with the Prince of Wales, proceeded north, and for a time fixed his residence at York. The king was received in his progress with great demonstrations of loyalty from the gentry; and many eminent and virtuous characters, the conscientious opposers of his arbitrary measures in the first instance, now joined his party. On the other hand, all the Puritans, the inhabitants of the great trading towns, and those who had adopted republican notions of government, sided with the Parliament; and in no public contest was more private and public virtue ranged on both sides, however alloyed, as in all such cases, with ambition, bigotry, and the baser passions. The first action of consequence was the battle of Edge Hill

CHARLES

23 Oct. 1642, which, although indecisive, enabled the king to approach London, and produce considerable alarm. Nothing decisive, however, happened against the royal side till the battle of Marston Moor in 1644, which was gained chiefly by the skill and valor of Cromwell. The succeeding year completed the ruin of the king's affairs, by the loss of the battle of Naseby.

Thenceforward a series of disasters attended his armies throughout the kingdom, and he took the resolution of throwing himself into the hands of the Scottish army, then lying before Newark, 5 May 1646. He was received with respect, although placed under guard as a prisoner; and, a series of abortive negotiations ensuing, an agreement was made with Parliament to surrender him to their commissioners, on the payment of a large sum, claimed as arrears by the Scottish army. The king was accordingly surrendered to the commissioners appointed 30 Jan. 1647, and carried, in the first place, to Holmby House, in Northamptonshire; subsequently, to the headquarters of the army at Reading; and soon after to Hampton Court. In the meantime, however, the army and Independents becoming all powerful, he was led into some fears for his personal safety, and, making his escape with a few attendants, proceeded to the south coast. Not meeting a vessel, as he expected, he crossed over to the Isle of Wight, and put himself into the hands of Hammond, the governor, by whom he was lodged in Carisbrooke Castle.

While the king was in this situation, the Scots, regretting the manner in which they had delivered him up, and indignant at the proceedings of the English, marched a considerable army to his relief, under the Duke of Hamilton. This force, although strengthened by a large body of English royalists, was entirely routed and dispersed by Cromwell at Preston, as were the insurgents in Kent and Essex by Fairfax. During this employment of the army and its leaders a new negotiation was opened with the king in the Isle of Wight, who agreed to nearly everything demanded of him, except the abolition of Episcopacy; and so much had it now become the interest of the Parliament itself to comply with him, that a vote was at length carried, that the king's concessions were a sufficient ground for a treaty. The triumphant army, however, on its return, cleared the House by force of all the members opposed to its views; and thereby procuring a reversal of this vote, the king's person was again seized, and, being brought from the Isle of Wight to Hurst Castle, preparations were made for trying him on the capital charge of high treason against the people. As the House of Lords refused to concur in a vote for this purpose, the Commons declared its concurrence unnecessary; and the king, being conducted to London and stripped of all ensigns of royalty, was brought before the court of justice specially erected for this unprecedented trial, on 20 Jan. 1649.

The behavior of Charles had been calm and dignified throughout his adversity, and in no respect was it more so than on this occasion. Three times he objected to the authority of the court when brought before it, and supported his refusal by clear and cogent arguments. At length, evidence being heard against him on

the proof that he had appeared in arms against the parliamentary forces, sentence of death was pronounced against him. He requested a conference with both Houses, which was rejected, and only three days allowed him to prepare for his fate. After passing the three days in religious exercises, and in tender interviews with his friends and family, he was led to the scaffold. His execution took place before the Banqueting House, Whitehall, on 30 Jan. 1649, where, after addressing the people around him with great firmness and composure, the ill-fated king submitted to the fatal stroke.

Thus died Charles I., in the 49th year of his age. He was, in an eminent degree, temperate, chaste, and religious, and although somewhat cold and reserved in demeanor, was really kind and affectionate. His talents were also considerable; but he was deficient in the decision and self-reliance necessary to superior executive ability. His mind was cultivated by letters and a taste for the polite arts, particularly painting, the professors of which he munificently encouraged; and his collections of work on art show judgment in the selection. To all these personal and private requirements he joined a graceful figure and pleasing countenance, and, under happier circumstances, would doubtless have been regarded as a very accomplished sovereign.

With respect to his political character, as exhibited in the great struggle between himself and the Parliament, it is impossible not to perceive that he strove to maintain a portion of prerogative that had become incompatible with any theory of civil and religious liberty; but it is equally certain that he only sought to retain what his predecessors had possessed. There are periods in the history of every people in which old and new opinions conflict, and a concussion becomes unavoidable; and it was the misfortune of Charles to occupy the throne at a time when the development of the representative system necessarily brought it into conflict with the claims of prerogative. If the Parliament had acquiesced in the kingly pretensions, as usually explained by Laud and the high churchmen of the day, it would have dwindled into a mere registry of royal edicts, like those of France. On the other hand, Charles acted a part which every monarch in his situation may be expected to act; for a philosophical appreciation of the true nature of a political crisis is scarcely to be expected from one who sits upon a throne. The most forcible accusation against Charles is on the score of insincerity. It is asserted that he never intended to fulfill the conditions imposed upon him. This can scarcely be denied; but it is equally certain that some of them might justly be deemed questionable, and may even have been imposed in order to produce that conduct in the king which so naturally followed. See Chancellor, 'Life of Charles I., 1600-25' (1886); Skelton, 'Life of Charles I.' (1898); S. R. Gardiner, 'History of the Great Civil War.'

Charles II., king of Great Britain and Ireland, son of Charles I. and Henrietta Maria of France: b. London 29 May 1630; d. there 6 Feb. 1685. He was a refugee at The Hague on the death of his father, on which he immediately assumed the royal title. He listened to an invitation from the Scots, who had proclaimed him

CHARLES

their king 5 Feb. 1649, and arrived in the Cromarty Firth 16 June 1650. Being obliged to throw himself into the hands of rigid Presbyterians, they subjected him to many severities and mortifications, which caused him to regard that sect ever after with extreme aversion. In 1651 he was crowned at Scone; but the approach of Cromwell soon rendered his abode in Scotland unsafe. Hoping to be joined by the English royalists, he took the spirited resolution of passing Cromwell and entering England, Carlisle readily throwing open its gates to receive him. He was immediately pursued by that active commander, who, with a superior army, gained the battle of Worcester, and Charles, after a variety of imminent hazards, being on one occasion sheltered for 24 hours in the branches of the famous Boscobel oak, reached Shoreham, in Sussex, and effected a passage to France.

It is the province of history to state the circumstances that produced the Restoration, which Gen. Monk so conducted that Charles, without a struggle, succeeded at once to all those dangerous prerogatives which had cost the nation so much blood and treasure, first to abridge and then to abolish. On 29 May 1660, Charles entered his capital amid universal and almost frantic acclamations; and the different civil and religious parties vied with each other in loyalty and submission. His first measures were prudent and conciliatory. Hyde, Lord Clarendon, was made chancellor and prime minister; and an act of indemnity was passed, from which those alone were excepted who were immediately concerned in the late king's death. A settled revenue was accepted in lieu of wardship and purveyance, and the army was reduced. In respect to religion, there was less indulgence; for not only were prelacy and the parliamentary rights of bishops restored, which was to be expected, but an act of uniformity was passed, by the conditions of which nearly all the Presbyterian clergy were driven to a resignation of their livings. In 1662 he married the Infanta of Portugal, a prudent and virtuous princess, but in no way calculated to acquire the affection of a man like Charles. The indolence of his temper and the expenses of his licentious way of life soon involved him in pecuniary difficulties; and the unpopular sale of Dunkirk to the French was one of his most early expedients to relieve himself.

In 1663 a rupture took place with Holland. It was attended, in the first instance, by various naval successes; but France and Denmark entering into the war, as allies of the Dutch, the English were overmatched, and a Dutch fleet entered the Thames, and, proceeding up the Medway, burned and destroyed ships as high as Chatham. The domestic calamities of a dreadful plague in 1665, and of the great fire in London in 1666, added to the disasters of the period. Soon after, Clarendon, who had become very unpopular, and was personally disagreeable to Charles, was dismissed, and sought shelter from his enemies by a voluntary exile. A triple alliance between England, Holland, and Sweden, for the purpose of checking the ambition of Louis XIV., followed. It did honor to the political talents of Sir William Temple, and was one of the few public measures of the reign which deserve approbation. In 1670 Charles threw himself into the hands of the five unprincipled ministers, collectively denominated the

cabal, who supported him in every attempt to make himself independent of Parliament. The party troubles of this reign commenced about this time by the open declaration of the Duke of York, presumptive heir to the crown, that he was a convert to the Roman Catholic religion. Soon after the ministry broke the triple alliance, and planned a rupture with the Dutch; and as the king did not choose to apply to Parliament for money to carry on the projected war, he caused the exchequer to be shut up in January 1672. The naval operations against the Dutch were by no means successful, and a new Parliament being called, which strongly expressed the discontent of the nation, the cabal was dissolved, and a separate peace made with Holland in 1674. Divisions in the cabinet, fluctuations in the king's measures, and parliamentary contests followed, and occupied the next three years, till, in 1677, Charles performed a popular act, by marrying his niece, the princess Mary, to the Prince of Orange. By taking some decided steps in favor of the Dutch he also forwarded the Peace of Nimeguen in 1678. The same year was distinguished by the pretended discovery of the popish plot for the assassination of the king, and the introduction of the Roman Catholic faith. Notwithstanding the infamous characters of Oates and Bedloe, and the improbable nature of their disclosures, their tale, supported by the general suspicions of the secret influence of a Catholic faction, met with universal belief; the Parliament exhibiting nearly as much credulity and heat as the masses. Many Catholic lords were committed; Coleman, the Duke of York's secretary, and several priests hanged; and a venerable nobleman, the Earl of Stafford, beheaded. The Duke of York thought fit to retire to Brussels, and a bill for his exclusion from the throne passed the House of Commons. Such was the state of the country that Charles was obliged to give way to some popular measures, and the great palladium of civil liberty, the Habeas Corpus bill, passed during this session. The temper of the Parliament was so much excited that the king first prorogued and then dissolved it. The court now sought to establish a balance of parties; to distinguish which, the terms Whig and Tory were about this time brought into use.

In 1680 a new Parliament assembled, and the Commons again passed the Exclusion Bill, which was rejected by the Lords. This Parliament was also dissolved in the next year, and a new one called at Oxford, which proved so restive, that a sudden dissolution of it ensued; and, like his father, Charles determined henceforward to govern without one. By the aid of the Tory gentry and the clergy he obtained loyal addresses from all parts of the kingdom, and attachment to high monarchical principles came again into vogue. The charge of plots and conspiracies was now brought against the Presbyterians. The Nonconformists, generally, were also treated with much rigor; and a step of great moment, in the progress to arbitrary power, was the instituting suits at law (*quo warrantos*) against most of the corporations in the kingdom, by which they were intimidated to a resignation of their charters, in order to receive them back so modeled as to render them much more dependent than before. These rapid strides toward the destruction of liberty at length produced the celebrated Rye House plot,

CHARLES

the parties to which certainly intended resistance; but that the assassination of the king was ever formally projected seems very doubtful. It certainly formed no part of the intention of Lord William Russell, whose execution, with that of Algernon Sidney, on account of the plot, forms one of the striking events of this disgraceful reign.

Charles was at this time as absolute as any sovereign in Europe; and had he been an active prince, the fetters of tyranny might have been completely riveted. Scotland, which at different periods of his reign had been driven into insurrection by the arbitrary attempts to restore Episcopacy, was very nearly dragooned into submission; and the relics of the Covenanters were suppressed with circumstances of great barbarity. At his death he received the sacrament according to the rites of the Catholic Church.

The character of Charles II. requires little analysis. He was a confirmed sensualist and voluptuary; and his reign was the era of the most dissolute manners that ever prevailed in England. The stage was an open school of licentiousness, and polite literature was altogether infected by it. Charles was a man of wit, and a good judge of certain kinds of writing, but too deficient in sensibility to feel either the sublime or the beautiful in composition; neither was he generous even to the writers whom he applauded. He possessed an easy good nature, but united with it a total indifference to anything but his own pleasure; and no man could be more destitute of honor or generosity. His ideas of the relation between king and subject were evinced by his observation on Lauderdale's cruelties in Scotland: "I perceive," said he, "that Lauderdale has been guilty of many bad things against the people of Scotland; but I cannot find that he has acted in anything contrary to my interest." Yet, with all his selfishness and demerits as a king, Charles always preserved a share of popularity with the multitude from the easiness of his manners. Pepy's 'Memoirs' and other private documents, however, clearly show the opinion of the more reflecting portion of his subjects; and it is now pretty generally admitted that, as he was himself a most dishonorable and heartless monarch and man, so his reign exhibited the English character in a more disgraceful light than any other in English history. It need not be added that he left many illegitimate children, the descendants of some of whom are still among the leading nobility of the country. The fate of his most distinguished son, the ill-fated Duke of Monmouth, is an affair of history.

Charles (shārl) I. ("le Chauve," or "the Bald"), king of France, son of Louis le Débonnaire: b. Frankfort-on-the-Main 13 June 823; d. 877. He was invested by his father with the kingdoms of Alemannia, Burgundy, Provence, and Septimania, and subsequently with that of Aquitaine. On Louis' death in 840, Charles found himself confronted with two enemies — his half-brother Lothaire, who, as eldest son, claimed the whole of the Frank empire of Charlemagne, and his nephew Pepin, who asserted, in right of his father, a preferable claim to the sovereignty of Aquitaine. After considerable bloodshed, a treaty was entered into between Charles and Lothaire at Verdun, by which the

former received, as his share of the dominions of Charlemagne, all those territories comprehended between the ocean on the one part, and the Meuse, the Scheldt, the Saône, the Rhone, and the Mediterranean on the other. His struggle with Pepin was long and obstinate, and in 844 he was obliged to recognize him as king of southern Aquitaine. In 875, by the death of his nephew, the Emperor Louis II., he gained possession of the imperial crown, and thereby provoked the hostility of his brother, Louis the German, who ravaged the territory of Champagne, and otherwise committed great havoc in his dominions. In 877 he proceeded to Italy on a crusade against the Saracens, to which he had been summoned by the Pope, but died when crossing Mount Cenis.

Charles II. ("le Gros," or "the Fat"), king of France, also known as Charles III., emperor of Germany: b. about 832; d. Neidingen, Suabia, 13 June 888. He was the son of Louis the German, and the grandson of Louis le Débonnaire, and was recognized as emperor of Germany by the Pope. In 885 he ascended the French throne, to the prejudice of his cousin, Charles the Simple, whose youth prevented him from asserting his rights, but in 887 was deposed, and the following year died miserably, strangled, as is asserted, by his servants.

Charles III. ("the Simple"), king of France, the posthumous son of Louis the Stammerer: b. 17 Sept. 879; d. 929. On his father's death France was divided between Charles' two brothers, Louis III. and Carloman, and an aristocratic oligarchy. On the death of his brothers he ought in right to have ascended the throne, but his extreme youth prevented his claims being recognized, and his cousin, Charles the Fat, was proclaimed king in 885. On the deposition of the latter in 887 Count Eudes of Paris succeeded in obtaining the crown; but his death in 898, left Charles undisputed king of the whole country. The reign of Charles is chiefly noted for the piratical incursions of the Northmen or Normans, who ravaged the coasts of France, sailed up the principal rivers, and spread such dismay that, to conciliate them and put an end to their devastations, he agreed to cede to their chief, Rollo, the territory of Normandy, to be held as a fief of the French crown. Latterly also Charles' tranquillity was much disturbed by the turbulence of some of his great vassals, who broke into open rebellion, declared the throne forfeited, and proclaimed as king, Robert, brother of Count Eudes. Through the treachery of Herbert, Count of Vermandois, Charles was inveigled into the town and imprisoned in the fortress of Peronne. From this he was only liberated a short time before his death.

Charles IV. ("the Fair"), king of France, third son of Philippe le Bel: b. 1294; d. 1328. In virtue of the salic law he ascended the throne in 1322, to the exclusion of the daughters of Philip the Long. He reigned six years, dying in 1328 without male issue, the last of the direct line descended from Hugh Capet. Isabella, his sister, married Edward II. of England, and was materially aided by Charles in fitting out, along with her paramour Mortimer, the expedition which resulted in the dethronement of her husband.

CHARLES

Charles V. ("the Wise"), king of France, son of John II.: b. Vincennes 21 Jan. 1337; d. there 16 Sept. 1380. While Duke of Normandy, and during the captivity of his father in England, after the battle of Poitiers, he took the title of lieutenant of the kingdom. The vices and extravagance of the court were extreme, and the demands of the States-General for reform, headed by Stephen Marcel, provost of the merchants of Paris, were loudly and persistently urged. This assembly was supported in its claims by Charles the Bad, king of Navarre, who, as grandson of Louis le Hutin, maintained a preferable right to the crown. By artfully temporizing Charles contrived to detach the leading orders from the cause of the states, and having brought about indirectly the assassination of Marcel, succeeded in crushing their party. Meantime his father John still continued in captivity in England till liberated by the Treaty of Brétigny in 1360. Four years afterward he died, leaving Charles as successor to the French crown. The reign of the latter presents a series of combined hostilities and intrigues carried on with the view of establishing his power and extending his dominions. In these he was so far successful as to keep at bay the king of Navarre and deprive the English of a great part of their possessions in France. The magnanimity and wisdom of Charles have been greatly commended by some writers, and if we make due allowance for the times in which he lived, the high character which these have assigned him may not appear overcharged. That in his public administration, however, he was guilty of various acts of perfidy and cruelty cannot be disputed. He possessed some literary tastes, and was the founder of the Bibliothèque Royale. A less beneficial act was the erection of the Bastille, for the purpose of overawing the Parisians, whose outbreaks he had found reason to dread.

Charles VI. ("the Silly"), king of France, and son of Charles V.: b. Paris 3 Dec. 1368; d. 21 Oct. 1422. When his father died he was not 12 years old, and the contending pretensions of his uncles, the Dukes of Anjou, Berry, Burgundy, and Bourbon, rendered his minority a scene of unbounded turbulence and license. In 1385 he was married at Amiens to Isabella of Bavaria. In 1388 he declared himself independent of guardians, and took the reins of government into his own hands. His mild and amiable, though somewhat dissipated character, had already secured for him a considerable share of popularity, when he was overtaken by a fearful calamity, the loss of his reason—a condition in which, with a few lucid intervals, he remained to the end of his days. The origin of this was constitutional, aggravated by a fright and a severe accident. Perhaps at no period in her history was France the scene of greater disasters and miseries than during the reign of this unhappy prince. The rival factions of the Burgundians and the Armagnacs, kept up constantly throughout the country the horrors of a most rancorous civil war; while brigandage and every kind of violence prevailed to the most fearful extent. Such a conjunction afforded the most favorable opportunity for an invader; and accordingly, in 1415, Henry V. of England crossed over to Normandy with a numerous army, took Harfleur by storm, and signally de-

feated the French forces in the battle of Agincourt. Improving these advantages he advanced into the country, gained possession of the capital, and compelled the crazy king to sign the Treaty of Troyes, by which his daughter Catharine was given in marriage to Henry, and the latter acknowledged successor to the French crown after Charles' death. Neither monarch long survived this celebrated paction, both dying within a few months of each other.

Charles VII., king of France, 5th son of Charles VI.: b. Paris 22 Feb. 1403; d. Mehun 22 July 1461. He became, by the successive deaths of his elder brothers, dauphin and heir-presumptive to the crown. On the king of England's death in 1422 his son Henry VI. was proclaimed king of France at Paris. The war with the national party, represented by the Orleanist faction, with the dauphin at their head, was maintained for several years by the English, under the command of the Duke of Bedford. So successfully did the latter conduct operations that Charles was brought to the verge of despair, and almost reduced to abandon the struggle as hopeless, when his fortunes were retrieved by the arrival in his camp of the Maid of Orleans, who by the enthusiasm which she inspired first turned the tide of success against the English. (See JOAN OF ARC.) The fresh spirit thus infused into the breasts of the French was heightened by mismanagement on the part of the English, whose military operations were conducted with greatly diminished efficiency after the death of the Duke of Bedford, while discord and confusion prevailed in the home councils. Through the intervention of the Earl of Suffolk a marriage was concluded between the young king Henry VI. and Margaret of Anjou, niece of Charles VII.'s queen. In the treaty entered into on this occasion the territory of Maine was secretly surrendered to France, and subsequently, on hostilities being resumed between the two countries, the troops of Charles conquered the whole of Guienne, and finally expelled the English from all their possessions in France except Calais. The last years of Charles' reign were embittered by domestic broils, in which his son and successor Louis XI. took a prominent part against his father. So hemmed in at last was the latter by the emissaries of the dauphin that he conceived the idea of Louis having formed a deliberate plan to poison him; and so firmly was this notion rooted in his mind that he could only with the greatest difficulty be induced to take any food. A romantic interest has been thrown around Charles VII. by his early reverses and the re-establishment of French nationality, which he effected mainly through the heroism inspired by the Maid of Orleans. His personal character, however, was weak and contemptible, without energy and without principle, surrendering himself continually to sensual and degrading pleasures. His share in the treacherous murder of the Duke of Burgundy, and base abandonment to her fate of Joan of Arc, are stains on his memory which cannot be effaced.

Charles VIII., king of France, son of Louis XI.: b. Amboise 30 June 1470; d. there 7 April 1498. He succeeded his father in 1483, his sister Anne de Beaujeu acting as regent till he attained the age of 20. In 1491 he mar-

CHARLES

ried Anne, the heiress of Brittany, and thereby annexed that important duchy to the French crown. By so doing, however, he both broke faith with the daughter of Maximilian, king of the Romans, to whom he had been espoused, and also robbed Maximilian of his bride, a marriage by proxy having been already concluded between him and Anne. The leading incident of Charles VIII.'s reign is his Italian expedition and conquest of the kingdom of Naples, having been instigated thereto by Ludovico Sforza, the usurping Duke of Milan. The title pretended to Naples was asserted in virtue of the rights to that sovereignty transmitted by the house of Anjou to the royal family of France. The whole of Charles' expedition reads like a page from one of the old chivalrous romances. With an army of 30,000 men, unprovided either with money or stores, he suddenly crossed the Alps, advanced rapidly southward, and meeting with scarcely any obstruction, arrived before the walls and gained possession of Naples. This conquest, however, he did not retain for many months. Having left 5,000 men to guard his new acquisition he returned to France, and had scarcely reached it when the arms of Gonsalvo de Cordova effected the re-annexation of Naples to Spain. The expedition of Charles VIII. left thus hardly a trace upon the country, but is memorable as the commencement of that series of French incursions into Italy which, under his successors deluged that fair land with bloodshed. He left no children, and was succeeded by his relative, the Duke of Orleans, under the title of Louis XII.

Charles IX., king of France, son of Henry II. and Catharine de Medici: b. St. Germain-en-Laye 27 June 1550; d. 30 May 1574. He ascended the throne at the age of 10, after the death of his brother, Francis II. No regency was appointed, and it was deemed sufficient to write to the Parliament, through the young prince, that he had requested his mother to undertake the administration of the public affairs. The Parliament acquiesced in this resolution, to avoid exciting new contests between the Guises and the princes of the blood. The Duke of Guise, who obtained possession of the person of the young king, was shot by an assassin before Orleans, in February 1563. In his last moments he advised the king and the queen mother to negotiate with the parties. This advice was followed; a treaty was signed 19 March and Havre taken from the English 27 July. The king, who was the same year declared of age, visited the provinces in company with his mother. At Bayonne he had a meeting with his sister Isabella, the wife of Philip II. of Spain. This excited such suspicions in the Calvinists that they took up arms, and immediately formed the plan of attacking the king on his return to Paris. Being warned in season he escaped the danger; but this plot could not fail to arouse the hatred of Charles. After the battle of St. Denis, 1567, in which the constable of Montmorency lost his life, Catharine entered into negotiations for peace. But the Calvinists reserved a part of the places which they were to have surrendered, and continued to keep up a communication with England and the German princes. A new civil war soon broke out. Notwithstanding the jealousy of Charles, Catharine placed the Duke of Anjou at the head of

the royal army. The Prince of Condé having been shot in the battle of Jarnac in 1569, and the Admiral Coligny having been defeated at Montcontour in the same year, the king concluded peace, in 1570, on terms so favorable to the Calvinists that they seem even to have suspected treachery under them. The heads of that party did not therefore all appear at court when Charles celebrated his marriage with Elizabeth, the daughter of Maximilian II. By degrees this distrust disappeared, and the marriage of the young king of Navarre (afterward Henry IV.) with Margaret, sister of Charles X., seemed to banish every suspicion. This marriage took place 18 Aug. 1572. On the 22d the first attempt was made on the life of Coligny, and on the 24th began that massacre known under the name of the massacre of St. Bartholomew, from having taken place on the night of the festival of that saint. Civil war broke out for the fourth time, and Catharine now became aware of the errors of her policy. Charles could no longer conceal his aversion to her, and was on the point of assuming himself the reins of government, when he died, childless, in 1574.

Charles X., COMTE D'ARTOIS, king of France: b. Versailles 9 Oct. 1757; d. Goritz, Austria, 6 Nov. 1836; grandson of Louis XV. He was the youngest son of the dauphin, and brother of Louis XVI. He spent a dissipated youth, and left France in 1789, after the first popular insurrection and destruction of the Bastille, and at Pilnitz attended the Congress of Princes, for the purpose of opposing the spread of revolutionary principles. After Louis XVI. had accepted the Constitution of 1791, he invited Charles to return to France, but he refused, and the legislative assembly, after stopping his allowance on the civil list, confiscated his property in 1792. He afterward assumed the command of a body of emigrants, and acted in concert with the Austrian and Prussian armies on the Rhine. At a later period he made a descent on the coast of Brittany, but despairing of success, retreated to Great Britain, and resided for several years in the palace of Holyrood at Edinburgh. After the downfall of Napoleon he entered France with the title of lieutenant-general of the kingdom, and issued a judicious proclamation, promising the reign of law and an entire oblivion of the past. In 1824 he succeeded his brother, Louis XVIII., under the title of Charles X., and gained a momentary popularity by the abolition of the censorship of the press, but measures of a very different description soon followed, and the spirit of disaffection was so widely spread that a collision with the popular party became inevitable. Charles X. endeavored to gain the start by what is called a *coup d'état*, and issued his celebrated ordonnances, but victory declared against him, and he was ignominiously driven from the throne in 1830. After formally abdicating in favor of his grandson, the Duke de Bordeaux, he revisited England, resumed his residence for a short time at Holyrood, and finally settled at Göritz in Styria. See Lorieux, 'Histoire de Règne de Charles X.' (1834).

Charles I., king of Germany. See CHARLES THE GREAT.

Charles II., king of Germany. See CHARLES I. of France.

CHARLES

Charles III., surnamed **LE GROS**, king of Germany. See **CHARLES II.** of France.

Charles IV., emperor of Germany, of the house of Luxemburg: b. Prague 14 May 1316; d. there 29 Nov. 1378. He inherited the kingdom of Bohemia, and had been chosen emperor in 1346 by five electors, hoping to occupy the imperial throne without opposition. But the princes of the empire regarded him as a servant of the Pope. He however used every effort to appease his enemies, married the daughter of the Elector of the Palatinate, gave Tyrol as a fief to the Elector of Brandenburg, and was unanimously elected emperor, and consecrated at Aix-la-Chapelle. But no sooner was he crowned than he took possession of the imperial insignia, and conveyed them to Bohemia. In 1354 the emperor went to Italy to be crowned by the Pope; but this favor he purchased on terms which made him an object of ridicule and contempt. He engaged to appear without any armed force. Having been consecrated king of Italy at Milan, he confirmed the Visconti in the possession of all the usurpations of which he had promised to deprive them. He also annulled all the acts of his grandfather, Henry VII., against Florence, and by a treaty concluded at Padua resigned the latter city, with Verona and Vicenza, to Venice. He refused the request of some Romans to claim the city, as belonging to him in the name of the empire, and in a treaty renounced all sovereignty over Rome, the states of the Church, Ferrara, Naples, Sicily, Sardinia, and Corsica, and even took an oath not to return to Italy without the consent of the Pope. Despised by the Guelphs, detested by the Ghibellines, Charles returned to Germany, where he issued the celebrated golden bull, which, till modern times, continued a fundamental law of the German empire. He thus acquired some claims to the public gratitude, but these were soon effaced by the general indignation, excited by the proposal made, with his consent by the papal nuncio, to introduce a tax, equal to the tithe of all ecclesiastical revenues, for the benefit of the holy see. All the members of the diet opposed it; and Charles, in his anxiety to conciliate the princes of the empire, announced that he would propose to the Assembly a reform of the German clergy. The Pope, opposing this proposal of the emperor, exhorted the electors to depose him. Charles immediately relapsed into his accustomed submissiveness, and not only abandoned all his reforms, but even confirmed, in 1359, all the privileges of the clergy, all their present and future possessions, and made them independent of the secular power. Such vacillating conduct subjected him to the contempt of both parties. Under such an emperor Germany could not enjoy internal tranquillity. Bands of robbers plundered the country in all quarters. The emperor left the princes and cities to protect themselves by mutual alliances. The state of Italy was no less melancholy. Tuscany was suffering the evils of anarchy; Lombardy was distracted by civil wars, and the Visconti had made themselves masters of the Milanese. During his residence in Italy, he sold states and cities to the highest bidder, or, if they themselves offered most, made them independent republics. With great treasures he returned to Germany. Gregory XI. having given his consent that his

son Wenceslaus should be elected king of the Romans, he employed his ill-gotten wealth to purchase the votes of the electors, who were irritated at the conduct of the Pope, and, moreover, distributed among them the domains of the empire on the Rhine, and several free imperial cities. Thus he attained his object. To maintain their rights against the arbitrary measures of the emperor, the imperial cities in Suabia formed the Suabian league, which Charles opposed in vain. His reign is notable for the improvement and prosperity of Bohemia; for the founding of the universities of Prague and Vienna; for a terrible persecution of the Jews, and as the period when the sale of letters of nobility commenced in Germany.

Charles V., emperor of Germany and king of Spain (in the latter capacity he is called Charles I.): b. Ghent 24 Feb. 1500; d. Yuste, Spain, 21 Sept. 1558. He was educated in the Netherlands under the care of William of Croy, lord of Chièvres, who taught him history, formed him for affairs of state, and gave him that gravity of manner which he retained through life. After the death of Ferdinand of Spain, his grandfather, in 1516, Charles assumed the title of king of Spain. The management of this kingdom was intrusted to the celebrated Cardinal Ximenes. In 1519 Charles, on the death of Maximilian, was elected emperor. He left Spain to take possession of his new dignity, for which he had to contend with Francis I., king of France. His coronation took place at Aix-la-Chapelle with extraordinary splendor. The progress of the Reformation in Germany demanded the care of the new emperor, who held a diet at Worms. Luther, who appeared at this diet with a safe conduct from Charles, defended his cause with energy and boldness. The emperor kept silent; but after Luther's departure a severe edict appeared against him in the name of Charles, who thought it his interest to declare himself the defender of the Roman Catholic Church.

In a very few years the power of Charles became a source of uneasiness to most other princes of Europe. Pope Clement VII. placed himself at the head of a league of the principal states of Italy against the emperor, but their ill-directed efforts were productive of new misfortunes. Rome was taken by storm by the troops of the constable of Bourbon, sacked, and the Pope himself made prisoner. Charles V. publicly disavowed the proceedings of the constable, went into mourning with his court, and carried his hypocrisy so far as to order prayers for the deliverance of the Pope. Henry VIII. of England now allied himself with the French monarch against Charles, who accused Francis of having broken his word. The war was terminated in 1529 by the Treaty of Cambray, of which the conditions were favorable to the emperor. Charles soon after left Spain, and was crowned in Bologna as king of Lombardy and Roman emperor. In 1530 he seemed desirous, at the Diet of Augsburg, to reconcile the various parties; but not succeeding, issued a decree against the Protestants, which they met by the Schmalkaldic League. Notwithstanding his undertakings in favor of the Roman Catholic religion, Charles always practised moderation toward the Protestants whenever his interest left room for toleration. Nor did the Protestant

CHARLES

princes hesitate to furnish their contingents when he was assembling an army against the Turks. Having compelled Solymán to retreat, he undertook in 1535 an expedition against Tunis, reinstated the dey, and released 20,000 Christian slaves. This success added to his character somewhat of the chivalric, which gave him still more influence in Christendom, and promoted his political projects.

The policy of Charles was to reconcile the two great religious parties, and with this view he alternately threatened and courted the Protestants. After some show of negotiation the Protestant princes raised the standard of war. The emperor declared, in 1546, the heads of the league under the ban of the empire, excited divisions among the confederates, collected an army in haste, and obtained several advantages over his enemies. John Frederick, the elector of Saxony, was taken prisoner in the battle of Muhlberg in 1547. Charles received him sternly, and gave him over to a court-martial consisting of Italians and Spaniards, under the presidency of Alva, which condemned him to death. The elector saved his life only by renouncing his electorate and his hereditary estates, but remained a prisoner. Meanwhile the emperor appeared somewhat more moderately inclined toward the vanquished party. On coming to Wittenberg he expressed surprise that the exercise of the Lutheran worship had been discontinued. He visited the grave of Luther, and said, "I do not war with the dead; let him rest in peace; he is already before his Judge." The Landgrave of Hesse-Cassel, one of the heads of the Protestants, was compelled to sue for mercy. Notwithstanding his promise Charles deprived him of his freedom. After having dissolved the League of Schmalkalden the emperor again occupied himself with the plan of uniting all religious parties, and for this purpose issued the Interim, which was as fruitless as the measures proposed by him at the Diet of Augsburg. Neither was he successful in securing the imperial crown to his son. Discord still agitated public sentiment, and a new war broke out against him. Maurice of Saxony, whom he had invested with the electoral dignity, formed a league, which was joined by Henry II., king of France, the successor of Francis. The preparations had been made with the greatest secrecy. Charles was at Innsbruck superintending the deliberations of the Council of Trent, and meditating great plans against France and Turkey. He was expecting the aid of Maurice when this prince threw off the mask, appeared suddenly at the head of an army, and invaded the Tyrol in 1552 while Henry II. entered Lorraine. Charles was very nearly surprised in Innsbruck. Maurice abandoned the imperial castle to plunder, the Council of Trent was dissolved, and the Protestants dictated the conditions of the Treaty of Passau in 1552. Charles was not more successful in Lorraine. He was unable to recover Metz, defended by the Duke of Guise. In Italy he lost Sienna by a revolt. He withdrew to Brussels, where, hard pressed by his enemies, he became gloomy and dejected, and for several months concealed himself from the sight of every one, so that the report of his death was spread through Europe. His last exertions were directed against France, which constantly repelled his assaults. The Diet of Augsburg in

1555 confirmed the Treaty of Passau, and gave the Protestants equal rights with the Roman Catholics.

Charles, seeing all his plans frustrated and the number of his enemies increasing, resolved to transfer his hereditary states to his son Philip. Having convened the estates of the Low Countries at Louvain, in 1555, he explained to them the grounds of his resolution, asserted that he had sacrificed himself for the interests of religion and of his subjects, but that his strength was inadequate to further exertion, and that he should devote to God the remainder of his days. At that time Charles conferred on Philip the sovereignty of the Netherlands alone. On 15 Jan. 1556 he conferred upon him, in like manner, the Spanish throne, reserving for himself merely a pension of 100,000 ducats. He selected for his residence the monastery of St. Justus, near Plasencia in Estremadura, and here he exchanged sovereignty, dominion, and pomp for the quiet and solitude of a cloister. His amusements were confined to short rides, to the cultivation of a garden, and to mechanical labors. It is said that he made wooden clocks, and being unable to make two clocks go exactly alike, was reminded of the folly of his efforts to bring a number of men to the same sentiments. He attended religious services twice every day, read books of devotion, and by degrees fell into such dejection that his faculties seemed almost impaired. He renounced the most innocent pleasures, and observed the rules of the monastic life in all their rigor.

Charles had a noble air and refined manners. He spoke little, and smiled seldom. Firm of purpose; slow to decide; prompt to execute; equally rich in resources and sagacious in the choice of them; gifted with a cool judgment, and always master of himself. Circumstances developed his genius and made him great. Although he did not scruple to break his promises, he imposed, by the semblance of magnanimity and sincerity, even on those who had already experienced his perfidy. An acute judge of men, he knew how to use them for his purposes. In misfortune he appears greater than in prosperity. He protected and encouraged the arts and sciences, and is said to have picked up a brush which had fallen from the hand of Titian with the words, "Titian is worthy of being served by an emperor." By his wife Eleonora, daughter of Emanuel, king of Portugal, he had one son, afterward Philip II., and two daughters. He had also several natural children. No minister had a decided influence over him. He was indefatigable in business, weighing the reasons on both sides of every case with great minuteness. Wherever he was he imitated the customs of the country, and won the favor of every people except the Germans. Gachard, 'Correspondance de Charles Quint' (1850); Stirling Maxwell, 'Cloister Life of the Emperor Charles V.' (1852); Guntram, 'Kaiser Karl V.' (1865); Robertson, 'History of the Reign of Charles V.'

Charles VI., emperor of Germany, the second son of the Emperor Leopold I.: b. 1 Oct. 1685; d. 20 Oct. 1740. His father destined him for the Spanish throne. The last prince of the house of Hapsburg, Charles II., disregarding the house of Austria, whose right to the Spanish throne was undoubted, according to the

CHARLES

law of inheritance by descent, had by will made Philip, Duke of Anjou, second grandson of Louis XIV., heir of the Spanish monarchy. Accordingly, on the death of Charles II., 1 Nov. 1700, Philip took possession of the vacant kingdom. England and Holland united against him, and this alliance was soon joined by the German empire, Portugal, and Savoy. Charles was proclaimed king of Spain at Vienna, in 1703, and proceeded by way of Holland to England, from whence, in January 1704, he set sail with 12,000 men for Spain, which was almost wholly occupied by the French, and landed in Catalonia. He succeeded in making himself master of Barcelona; but was soon besieged there by his rival Philip V. At the head of a garrison of hardly 2,000 men, he made the most obstinate resistance, till the long-expected English fleet appeared, which compelled the French speedily to raise the siege. This event was followed by alternate reverses and successes. Twice Charles reached Madrid, and twice was he driven from the city. The first time, in 1706, he caused himself to be proclaimed king in the capital, under the name of Charles III. He had been a second time compelled to flee to the walls of Barcelona, when he was informed of the death of his brother Joseph I. According to the will of Leopold, this event placed the double crown of Charles V. on his head; to his claims on Spain it added the more certain possession of the Austrian dominions. But the allies did not like to see so much power united in the same hands. Charles returned to Germany, and on his arrival learned that, at Eugene's suggestion, he had also been elected emperor. His coronation took place at Frankfort, in December 1711; and in the following year he received, at Presburg, the crown of Hungary. At the same time he still retained the empty title of king of Spain. He now prosecuted, under the conduct of Eugene, the Spanish war of succession; the allies concluded a peace with France at Utrecht in 1713, in spite of all the efforts of the emperor to prevent it. He was obliged, in the following year, to sign the Treaty of Rastadt. This treaty secured him in the possession of Milan, Mantua, Sardinia, and the Netherlands. To secure his dominions to his daughter, Maria Theresa, in default of male heirs, Charles strove to induce the powers to guarantee the pragmatic sanction, which settled the succession in her favor. He succeeded in gaining the concurrence of all the European powers. The reign of this prince was marked with perpetual agitations. The succession to the Polish throne, after the death of Augustus II., in 1733, disturbed the peace of Europe. Charles, with Russia, supported the son of this prince; but France and Spain declared themselves for Stanislaus Leczinsky. From this arose a war, which terminated, in 1735, in the loss of the Two Sicilies, and a part of the duchy of Milan. Austria received Tuscany in exchange for Lorraine, and obtained Parma. Hardly had Charles finished this war, when his alliance with Russia involved him anew in a war with the Turks. In 1737 his troops invaded Serbia, without any declaration of war, and occupied Nissa. But the Turks renewed their attacks with a continually augmented force, and obliged the emperor, after three unsuccessful campaigns, to cede to them by the Peace of Belgrade, in 1739, Walachia and the Austrian part of Serbia, with Belgrade.

Charles VII. (properly **CHARLES ALBERT**), emperor of Germany: b. Brussels 6 Aug. 1697; d. Munich 20 Jan. 1745. He was the son of Maximilian Emanuel, elector of Bavaria, then governor of the Spanish Netherlands. His youth was spent at the imperial court, and in the war against the Turks he commanded the army of auxiliaries sent by his father. In 1722 he married the daughter of Joseph I., having previously renounced all rights which this marriage might give him to the succession to the throne of Austria. In 1726 he succeeded his father as Elector of Bavaria. He was one of the princes who protested against the pragmatic sanction, guaranteed in 1732 by the Diet of Ratisbon, and in consequence concluded a defensive alliance with Saxony. After the death of Charles VI., in 1740, he refused to acknowledge Maria Theresa as his heiress, founding his own claims to the succession on a testament of Ferdinand I. He was supported by the king of France with a considerable force. In 1741 he was recognized at Lintz as Archduke of Austria. The obstacles thrown in his way by Cardinal Fleury, who wished not to dismember the Austrian monarchy, as well as the want of artillery and ammunition, prevented him from getting possession of Vienna. On the other hand he took Prague, where he was crowned and proclaimed king of Bohemia. In 1742 he was unanimously elected king of the Romans: he made a solemn entry into Frankfort, and was crowned by his brother, the Elector of Cologne. But fortune soon deserted him. The armies of Maria Theresa reconquered all Upper Austria, and overwhelmed Bavaria. It was necessary to abandon Bohemia. Charles fled to Frankfort, and convoked a diet, when an attack of the king of Prussia on Maria Theresa allowed him to return to Munich in 1744. He was succeeded in the electorate by his son Maximilian Joseph, in the imperial dignity by Francis I., husband of Maria Theresa.

Charles I. of Anjou, king of Naples, the son of Louis VIII. of France: b. about 1220; d. Foggia 7 Jan. 1282. He waged war on King Manfred of Sicily, and having defeated him, seized on the Neapolitan crown in 1266. His cruelty and exacting rule induced such a detestation of the French name, that the Sicilians, headed by John de Procida, rose in arms on the eve before Easter Day, 1282, and slaughtered all the French in the town and neighborhood of Palermo, the signal for rising being the tolling of the vesper-bell; this tragedy is hence recorded in history as the "Sicilian Vespers" (q.v.). By this act the French were entirely expelled from the island.

Charles I., king of Portugal: b. 28 Sept. 1863. He is the son of Luiz I. and of Maria, the daughter of Victor Emmanuel II. of Italy, and came to the throne 19 Oct. 1889. Since that event a powerful radical element has made itself felt in Portugal. The country has, however, become of more importance than for some time previous owing to the progress that Portuguese colonization has lately been making in east Africa.

Charles I., **Karl Eitel Friedrich Zephyr Ludwig** (of **HOHENZOLLERN SIGMARINGEN**), king of Rumania: b. Germany 20 April 1839. The second son of Prince Karl of Hohenzollern, he entered the Prussian army early and held the

CHARLES

rank of lieutenant of dragoons when, at the suggestion of the Prussian ambassador, he was elected Prince of Rumania 10 May 1866. He subsequently proclaimed Rumania independent of Turkey and was declared king 26 March 1881. He was married in 1869 to Princess Elizabeth von Neuwied, who as "Carmen Sylva" (q.v.) is well known as an author.

Charles Albert, king of Sardinia: b. 2 Oct. 1798; d. Oporto, Portugal, 28 July 1849. He was the son of Charles Emmanuel, prince of Savoy-Carignan. He was educated in France, and in 1831 succeeded to the throne as the nearest heir on the death of Charles Felix, and in the first years of his reign showed himself favorable to the cause of progress by promoting a number of beneficial reforms. Subsequently, indeed, he became more absolute in his views, but after the French revolution of February 1848 he granted the nation a constitution, and took the field against Austria on behalf of the revolted peoples of the Lombardo-Venetian kingdom and the duchies of central Italy. His arms were at first very successful, defeating the Austrians in various encounters, but he was at last repulsed by Marshal Radetzky, and obliged to apply for an armistice. On its expiration he resumed hostilities, but only to endure reverses. The battle of Novara, fought on 23 March 1849, proved fatal to the aspirations of Charles Albert and Sardinia. That very day he abdicated in favor of his son, Victor Emmanuel II., afterward king of Italy, and retired to Oporto, in Portugal.

Charles I., king of Spain. See **CHARLES V.**, emperor of Germany.

Charles II., king of Spain: b. 6 Nov. 1661; d. 1 Nov. 1700. He succeeded his father, Philip IV., in 1665. In this reign, Spain, which for nearly three centuries had held the foremost rank in Europe as a great military nation, reached the highest point of its greatness, and began rapidly to decline both in influence and glory, but such was the prestige attached to its name and past history, that it had long become powerless before it ceased to be respected. Charles died in 1700, bequeathing his throne to the Duke d'Anjou, grandson of Louis XIV. of France, an act which led to the long and calamitous "War of the Spanish Succession."

Charles IV., king of Spain: b. Naples 12 Nov. 1748; d. there 19 Jan. 1819. He came to Madrid in 1759, when his father, Charles III., after the death of his brother, Ferdinand VI., ascended the Spanish throne, and succeeded him, 13 Dec. 1788. He was married to the Princess of Parma, Louisa Maria. Too imbecile to govern, he was always ruled by his wife and his ministers, among whom the Prince of Peace, Godoy, Duke of Alcudia, from the year 1792, had unbounded influence over him. The hatred which this favorite drew on himself from the Prince of Austria and other grandees brought on a revolution in 1808, which enabled Napoleon to dethrone the Bourbons. Charles abdicated at Aranjuez, 19 March, revoked this abdication, and finally ceded, at Bayonne, his right to the throne of Napoleon, who settled on him for life the palace of Compiègne and a pension of 6,000,000 francs. Charles after this lived at Compiègne with the queen and her paramour the Prince of Peace, but subsequently exchanged this residence for Rome, where the climate was

more congenial to him. From 1815 he occupied the palace Barberini in this city. Hunting he always made his principal employment.

Charles IX., king of Sweden: b. 5 Oct. 1550; d. Nyköping 30 Oct. 1611. He was the fourth son of Gustavus Vasa and was chosen king in 1604. He fostered trade and mining, and established the University of Gothenburg, at the same time that he was subduing the turbulent nobles of the realm and forming alliances with the Protestant princes of Pennany.

Charles X., king of Sweden: b. Nyköping 8 Nov. 1622; d. Gothenburg 13 Feb. 1660. He succeeded his cousin, Christina, in 1654, and by his prudence and valor considerably extended his dominions, wresting Livonia from the Poles, and several provinces from the crown of Denmark. After a short reign of six years, in which he was constantly engaged in war, sometimes meeting with severe reverses, but, on the whole, a considerable gainer, he was fatally attacked with an epidemic disease then raging among his troops, and was succeeded by his son Charles.

Charles XI., king of Sweden: b. 25 Dec. 1655; d. Stockholm 15 April 1697. He succeeded to the throne at five years of age, but the country was governed by a regency till 1672. He then put in force a system of tyrannous exaction and arbitrary oppression, by which he in a short time made himself absolute. Having once become independent of the states, he studied to appease the people by ruling with justice and impartiality. In war he was unsuccessful, and lost much of his father's territorial acquisitions. He founded the University of Lund, reorganized the army and navy and strengthened the fortresses of the country.

Charles XII., king of Sweden: b. Stockholm 27 June 1682; d. Frederikshall, 30 Nov. 1718. He was well instructed in the languages, history, geography, and mathematics. Curtius' "History of Alexander" was his favorite book. On the death of his father, in 1697, he was declared of age by the estates. Meanwhile the young king showed but little inclination for business: he loved violent bodily exercises, and especially the chase of the bear. To his jealous neighbors this seemed a favorable time to humble the pride of Sweden. Frederick IV. of Denmark, Augustus II. of Poland, and the Czar Peter I. of Russia therefore concluded an alliance which resulted in the northern war. The Danish troops first invaded the territory of the Duke of Holstein-Gottorp. Charles proposed in the Council of State the most energetic measures against Denmark, the result of which was the discomfiture of the Danes, while the Duke of Holstein was confirmed in all the rights of which it had been attempted to deprive him. Thus ended the first enterprise of Charles XII., in which he exhibited as much intelligence and courage as disinterestedness. He adopted at this time that severe and temperate mode of life to which he ever remained true, avoiding relaxation and useless amusements; wine was banished from his table; at times coarse bread was his only food; he often slept in his cloak on the ground; he generally wore a blue coat, with copper buttons, large boots reaching above his knees, and gloves of buffalo skin.

After thus checking Denmark the attacks of Augustus and Peter were to be repelled. The

CHARLES

former was besieging Riga, the latter menaced Narva and the country situated about the Gulf of Finland. Without returning to his capital, which in fact he never revisited, Charles caused 20,000 men to be transported to Livonia, and went to meet the Russians, whom he found 80,000 strong in a fortified camp under the walls of Narva. On 30 Nov. 1700, between 8,000 and 10,000 Swedes placed themselves in order of battle, under the fire of the Russians, and the engagement began. In less than a quarter of an hour the Russian camp was taken by storm. Thirty thousand Russians perished on the field or threw themselves into the Narva; the rest were taken prisoners or dispersed. After this victory Charles crossed the Dwina, attacked the intrenchments of the Saxons, and gained a decisive victory.

The war continued: the Swedes gained a brilliant victory at Clissau; in 1703 all Poland was in the possession of the conquerors. At Altranstadt he dictated the conditions of peace in 1706. The Livonian Patkul, who was the prime mover of the alliance against Sweden (at that time Peter's ambassador in Dresden), was delivered up to him on his demand, and was broken on the wheel. It might well cause general astonishment that a prince, till then so magnanimous, could stoop to such intemperate revenge. In other respects Charles exhibited, during his stay in Saxony, moderation and magnanimity.

In September 1707 the Swedes left Saxony. They were 43,000 strong, well clothed, well disciplined, and enriched by the contributions imposed on the conquered. Six thousand men remained for the protection of the king of Poland; with the rest of the army Charles took the shortest route to Moscow. But having reached the region of Smolensk he altered his plan, at the suggestion of the Cossack hetman Mazeppa, and proceeded to the Ukraine, in the hope that the Cossacks would join him. But Peter laid waste their country, and the proscribed Mazeppa could not procure the promised aid. The difficult marches, the want of provisions, the perpetual attacks of the enemy, and the severe cold, weakened Charles' army in an uncommon degree. Pultawa, abundantly furnished with stores, was about to be invested when Peter appeared with 70,000 men. Charles, in reconnoitering, was dangerously wounded in the thigh; consequently, in the battle of 8 July 1709, which changed the fortunes of the Swedish hero and the fate of the North, he was obliged to issue his commands from a litter, without being able to encourage his soldiers by his presence. They were obliged to yield to superior force, and the enemy obtained a complete victory. Charles saw his generals, his favorite minister, Count Piper, and the flower of his army, fall into the power of those Russians so easily vanquished at Narva. He himself, together with Mazeppa, fled with a small guard, and was obliged, notwithstanding the pain of his wounds, to go several miles on foot. He finally found refuge and an honorable reception at Bender, in the Turkish territory. The regency in Stockholm took measures for the defense of the Swedish territory. Gen. Steinbock assembled a body of militia and peasants, defeated the Danes at Helsingborg, and compelled them to evacuate Schonen. Several divisions were sent to Finland to keep off the

Russians, who nevertheless advanced, being superior in numbers. Charles, meanwhile, negotiated at Bender with the Porte; succeeded in removing the ministers who were opposed to him, and induced the Turks to declare war against Russia. The armies met on the banks of the river Pruth, 1 July 1711. Peter seemed nearly ruined when the courage and prudence of his wife produced a peace, in which the interests of Charles were entirely neglected. This monarch, however, projected at Bender new plans, and through his agents solicited of the Porte auxiliaries against his enemies. But the Russian agents were no less active to prepossess the Porte against him, pretending that Charles designed to make himself, in the person of Stanislaus, the actual master of Poland, in order from thence, in connection with the German emperor, to attack the Turks. The seraskier of Bender was ordered to compel the king to depart, and in case he refused, to bring him, living or dead, to Adrianople. Little used to obey the will of another, and apprehensive of being given up to his enemies, Charles resolved to defy the forces of the Porte with the 200 or 300 men of which his retinue consisted, and, sword in hand, to await his fate. When his residence at Varnitza, near Bender, was attacked by the Turks he defended it against a whole army, and yielded only step by step. The house took fire, and he was about to abandon it when, his spurs becoming entangled, he fell and was taken prisoner. The Turks now removed their prisoner from Bender to Demotica, near Adrianople. Escaping in disguise he reached Stralsund on the night of 22 Nov. 1714. A combined army of Danes, Saxons, Russians, and Prussians immediately invested Stralsund. Charles performed, during the defense, miracles of bravery. But being obliged to surrender the fortress, on 23 Dec. 1715, he proceeded to Lund, in Schonen, and took measures to secure the coast. He then attacked Norway. The Baron of Gortz, whose bold but intelligent plans were adapted to the situation of the Swedish monarchy, was at that time his confidential friend. His advice was, that Charles should gain Peter the Great to the interest of Sweden by important concessions, make himself master of Norway, and from thence land in Scotland, in order to dethrone George I., who had declared himself against Charles. Görtz discovered resources for prosecuting the war, and entered into negotiations at Aland with the plenipotentiaries of the czar. Peter was already gained and a part of Norway conquered; the fortunes of Sweden seemed to assume a favorable aspect; Charles was besieging Frederikshall, when, on 30 Nov. 1718, as he was in the trenches, leaning against the parapet and examining the workmen, he was struck on the head by a cannon-ball. He was found dead in the same position, his hand on his sword, in his pocket the portrait of Gustavus Adolphus and a prayer-book.

At Charles' death Sweden sank from the rank of a leading power. In his last years he had formed great plans for the improvement of its navy, trade, and commerce. At Lund he often conversed with the professors of the university, and attended public disputations on geometry, mechanics, and history. In Bender, the reading of useful books was one of his principal employments: he sent for Swedish scholars, and caused them to travel through

CHARLES — CHARLES THE BOLD

Greece and Asia. Accounts of some of these travels have been printed; there are others in manuscript at Upsal. Firmness, valor, and love of justice were the grand features of Charles' character, but were disfigured by an obstinate rashness. After his return he showed himself more peaceable, gentle, moderate, and disposed to politic measures. Posterity, considering him in relation to his times, will say that he had great virtues and great faults; that he was seduced by prosperity, but not overcome by adversity.

Charles XII., The History of, a famous work by Voltaire, published in 1731. It is divided into eight books, and is considered its author's historical masterpiece.

Charles XIII., king of Sweden: b. 7 Oct. 1748; d. 5 Feb. 1818. He was the second son of King Adolphus Frederick. Having been appointed at his birth high-admiral of Sweden, his education was directed chiefly to the learning of naval tactics, for which purpose he engaged in several cruises in the Cattegat. In 1765 he became honorary president of the Society of Sciences at Upsal. In 1770 he commenced the tour of Europe. The death of Adolphus Frederick recalled him to Sweden, where he took an important part in the revolution of 1772. His brother, Gustavus III., appointed him governor-general of Stockholm, and Duke of Sudermannland. In the war with Russia, in 1788, he received the command of the fleet, defeated the Russians in the Gulf of Finland, and, in the most dangerous season of the year, brought back his fleet in safety to the harbor of Carlscrona, after which he was appointed governor-general of Finland. After the murder of Gustavus III., in 1792, he was placed at the head of the regency, and, happily for Sweden, preserved the country at peace with all other nations, while he united with Denmark for the protection of the navigation in the northern seas. In 1796 he resigned the government to Gustavus Adolphus IV., who had become of age, and retired to his castle of Rosersberg. He did not again appear in public life till a revolution hurled Gustavus Adolphus IV., in 1809, from the throne, and placed Charles at the head of the state, as administrator of the realm, and some months afterward, 20 June 1809, as king of Sweden, at a very critical period. The peace with Russia, at Frederiksham, 17 Sept. 1809, gave the country the tranquillity necessary for repairing its heavy losses, and for completing the constitution. He had already adopted Prince Christian of Holstein-Sonderburg-Augustenburg as his successor, and after his death, Marshal Bernadotte, who was elected by the estates, in August 1810, to take the place of the prince. On him he bestowed his entire confidence. His prudent conduct in the war between France and Russia in 1812 procured Sweden an indemnification for Finland by the acquisition of Norway 4 Nov. 1814. Although some disappointed nobles may have given utterance to murmurs against his government, Charles XIII. nevertheless enjoyed the love of his people till his death.

Charles XIV., king of Sweden. See **BERNADOTTE**, JEAN BAPTISTE JULES.

Charles XV. (LOUIS EUGÈNE), king of Sweden and Norway: b. 3 May 1826; d. 18 Sept. 1872. He was the son of Oscar I., whom he succeeded 8 July 1859. In his reign the Storth-

ing, or parliament, was reconstituted and given a more representative character. He was the author of a book of poems.

Charles, archduke of Austria, third son of the Emperor Leopold II.: b. Florence 5 Sept. 1771; d. 30 April 1847. In his 20th year he distinguished himself in the battles of Jemappes and Neerwinden, in both of which the French republican armies were beaten, and was appointed governor-general of Belgium in 1793. Appointed in 1796 field-marshal of the empire and commander-in-chief of the Austrian army on the Rhine, he opened the campaign by the victory of Neumarkt over Jourdan, which were quickly followed by the successes of Teining and Amberg, which compelled Moreau to make his memorable retreat. In the winter of 1797 he captured Kehl, the only position the French occupied in Germany. After the fruitless congress at Rastadt he put himself at the head of the Rhine army, and again defeated his old opponent Jourdan at Ostrach and Stockach. Misunderstandings that arose between him and the Russian generals, Suwarow and Korsakow, and his weak state of health, compelled him to throw up his command and retire to Bohemia. In the protracted struggle in the heart of Germany Napoleon's genius was on every occasion triumphant, once only, at Aspern, did Charles snatch a victory from him, but the battle of Wagram laid Austria at the feet of the French emperor.

Charles, 1st Duke of Lorraine: b. 953; d. Orleans 994. He early succeeded to his paternal inheritance. No sooner, however, was he invested with sovereign power, than he laid claim to the crown of France, on the death of Louis V., and immediately endeavored to sustain his claim by force of arms; but in the first battle fought between the two powers, was made prisoner, his army entirely defeated, and himself cast into a dungeon in the gloomy castle of Orleans, where he died a prisoner, 994.

Charles Augustus, Grand Duke of Saxe-Weimar: b. 3 Sept. 1757; d. Graditz, Prussia, 14 June 1828. He succeeded to power in 1775, was a general in the army of Prussia 1772-93, and with the allies opposed Napoleon 1813-15. By the Congress of Vienna his principality was made a grand duchy. He liberally patronized science and art, and under him his capital of Weimar became the literary centre of Germany. He was a close friend of Goethe.

Charles the Bald. See **CHARLES I.** of France.

Charles the Bold, Duke of Burgundy: b. Dijon 10 Nov. 1433; d. Nancy 5 Jan. 1477. He succeeded to the dukedom in 1467, and immediately engaged in a war with the citizens of Liège, whom he conquered and treated with extreme severity. Before this undertaking he had been obliged to restore to the citizens of Ghent the privileges which had been taken from them by Philip the Good. He now revoked his forced concessions, caused the leaders of the insurrection to be executed, and imposed a large fine on the city. In 1468 he married Margaret of York, sister of the king of England. Learning that the inhabitants of Liège, instigated by the king, Louis XI., had rebelled anew, and made themselves masters of Tongres, he compelled the king to sign a treaty, the most disgraceful condition

CHARLES EDWARD STUART—CHARLES EMMANUEL

of which was that he should march with Charles against the city of Liège, which he had himself excited against the Duke. Charles encamped before Liège in company with the king; the city was taken by storm, and abandoned to the fury of the soldiers. Such success rendered the mind of the Duke utterly obdurate, and added the last traits of that inflexible sanguinary character which made him the scourge of his neighborhood, and led to his own destruction. Edward IV. conferred on him in 1470 the Order of the Garter. Shortly after he received in Flanders Edward himself, who came to seek an asylum with the Duke. Charles gave him money and ships to return to England.

About the end of the same year the war between the king of France and the Duke of Burgundy was renewed, and never did Charles show himself more deserving of the name of the "Bold" or "Rash," than in this war.

Having completed the conquest of Lorraine by the taking of Nancy in 1475, he turned his arms against the Swiss; and notwithstanding the representations of these peaceful mountaineers, who told him that all that he could find among them would not be worth so much as the spurs of his horsemen, he took the city of Granson, and put to the sword 800 men, by whom it was defended. But these cruelties were soon avenged by the signal victory which the Swiss obtained near the same city 3 March 1476.

With a new army he returned to Switzerland, and lost the battle of Murten (Morat) 22 June. The Duke of Lorraine, who had fought in the army of the Swiss, led the victors to the walls of Nancy, which surrendered 6 October. At the first information of this siege Charles marched to Lorraine, to retake the city of Nancy from the Duke René. On 5 or 6 January 1477 the two armies met: the wings of the Burgundian army were broken through and dispersed, and the centre, commanded by the Duke in person, was attacked in front and flank. As Charles was putting on his helmet, the gilded lion which formed its crest fell to the ground, and he exclaimed with surprise, *Ecce magnum signum Dei!* Defeated, and carried along with the current of fugitives, he fell, with his horse, into a ditch, where he was killed by the thrust of a lance. His body, covered with blood and mire, and with the head imbedded in the ice, was not found till two days after the battle, when it was so disfigured that for some time his own brothers did not recognize it. See Kirk, 'History of Charles the Bold' (1863-8). In 'Quentin Durward,' Sir Walter Scott has portrayed the character of Charles, and some of the quarrels between him and Louis of France.

Charles Edward Stuart (THE YOUNG PRETENDER), grandson of James II., king of England: b. Rome 31 Dec. 1720; d. there 31 Jan. 1788. From the cradle he was inspired with an impulse that induced him to attempt the recovery of the throne of his ancestors. With borrowed money, and seven trusty officers, he landed, 28 July 1745, at Lochnanuadh, Scotland, from a ship of 18 guns called the *Doutelle*, which contained arms for 1,500 men. He found so many adherents among the discontented Scottish nobles, who went over to his party together with the Highlanders under them, that he was soon at the head of a little army. With this he conquered the British troops which advanced to

meet him from Edinburgh, captured Perth, and caused himself to be proclaimed regent of England, Scotland, and Ireland. He also took Edinburgh, 17 Sept. 1745, where he was once more proclaimed regent, and surrounded with his ministers and generals. On 22 Sept. 1745 he defeated at Prestonpans an army of 4,000 British under Sir John Cope. He set the prisoners at liberty. His force was now 7,000 strong. With this he advanced, and laid siege to Carlisle, 15 November, which, after three days, surrendered and supplied him with a great number of arms.

He now caused his father to be proclaimed king, and himself regent of England; removed his headquarters to Manchester, and soon found himself within 100 miles of London, where many of his friends awaited his arrival. The rapid successes of the adventurer made the British government tremble; and a part of the British forces in Germany was recalled. Want of support, disunion, and jealousy among his adherents of the house of Stuart, and the superior force opposed to him, compelled Prince Charles to retire in the beginning of 1746. The victory at Falkirk, 28 Jan. 1746, was his last. As a final attempt he risked the battle of Culloden, against the Duke of Cumberland, 16 April 1746, in which his army was defeated and entirely dispersed. The prince now wandered for a long time through the wilds of Scotland, often without food, and the price of £30,000 sterling was set on his head. Once, when fairly surrounded by enemies, he succeeded in escaping by the devotion and courage of Flora McDonald. On 20 Sept. 1746, five months after the defeat of Culloden, he sailed from Scotland, and arrived in France destitute of everything. By the interest of Madame de Pompadour Charles now received an annual pension of 200,000 livres for life; he had also 12,000 doubloons yearly from Spain.

The Peace of Aix-la-Chapelle in 1748 deprived him of all prospects of recovering the throne of Great Britain. He went to Rome, the residence of his father, James III.; but his relations to the Roman court were changed after his father's death 1 Jan. 1766. His often ridiculous requests in regard to the etiquette to be observed toward him, which he made under the name of Count of Albany, rendered his presence troublesome. He went to Florence till Pius VI. recalled him to Rome by withdrawing his pension. That his family might not become extinct, he married in the 52d year of his age, 17 April 1772, a princess of Stolberg-Gedern; but his violence led to a separation in 1780. He now became addicted to intoxication. He died 31 Jan. 1788, in the 68th year of his life. Three years before he sent for his natural daughter from France, legitimated her, and declared her, on his royal authority, his lawful heiress, under the title of Countess of Albany. His body was carried to Frascati, and entombed in a style worthy of a king. A sceptre, crown, sword, and the escutcheons of England and Scotland adorned his coffin; and his only brother then living, the Cardinal of York, performed the funeral services for "dead King Charles." The Cardinal of York received a pension from Great Britain after 1799, and died in Frascati 13 July 1807.

Charles Emmanuel I., Duke of Savoy, surnamed "the Great": b. Rivoli 12 Jan. 1562; d. Savilian 26 July 1630. He formed (1590) the plan

CHARLES THE FAIR—CHARLESTON

of uniting Provence to his dominions. Philip II. of Spain, his father-in-law, obliged the parliament of Aix to acknowledge him as the protector of this province, in order by this example to induce France to acknowledge the king of Spain as protector of the whole realm. The Duke of Savoy, not less ambitious, likewise aimed at this crown, and after the death of Matthias desired also to be chosen emperor of Germany. He likewise intended to conquer the kingdom of Cyprus, and to take possession of Macedonia, the inhabitants of which, oppressed by the Turks, offered him the sovereignty over their country. The citizens of Geneva were obliged to defend their city in 1602 against this ambitious prince, who fell upon them by night in time of peace. Henry IV., who had reason to complain of the Duke, and whose general, the Duke of Lesdiguières, had beaten Charles Emmanuel several times, entered at last into a treaty of peace with him, not disadvantageous to the Duke of Savoy; but he could not remain quiet, and began again a war with France, Spain, and Germany.

Charles the Fair. See CHARLES IV. of France.

Charles the Fat. See CHARLES II. of France.

Charles Friedrich August Wilhelm, Duke of Brunswick: b. 30 Oct. 1804; d. 1873. He succeeded to the dukedom in 1823, but his rule was so arbitrary and oppressive that the German Diet deposed him. He subsequently lived in Paris and London, and at his death bequeathed his vast fortune to the city of Geneva.

Charles d'Orleans, shär'l'dor-lä-än', French nobleman and poet, son of Louis d'Orléans: b. 26 May 1391; d. 4 Jan. 1465. He was the grandson of Charles V. of France, and the father of Louis XII. He was taken prisoner at Agincourt, and kept in captivity in England from 1415 to 1440, when he was ransomed. He wrote a number of lyrics while in prison and after his return to France. At Blois, where he held his court, he gathered together the chief French writers of his time, and took part with them in poetical tournaments, in one of which François Villon competed successfully. He has been termed the father of French lyric poetry, but has no claim to the title. His light and graceful lyrics are the last flowering of the courtly poetry of the Middle Ages; they show no trace of the modern spirit which appears so strongly in the works of his contemporary, Villon. His favorite themes are love and the springtime; his favorite form is the rondel, with two rhymes, of which he is considered the chief master, as Villon is of the ballade, and Voiture of the rondeau.

Charles the Simple. See CHARLES III. of France.

Charles the Wise. See CHARLES V. of France.

Charles, Elizabeth Rundle, English writer of religious stories: b. 1826; d. London 28 March 1896. She was married to Andrew Charles in 1851. Her books have been widely popular in England and America, the most famous of them being 'The Chronicles of the Schonberg-Cotta Family' (1863). Among her other works are: 'Diary of Miss Kittie Trevelyan' (1864); 'The Draytons and Davenants' (1866); 'Winifred Bertram' (1866);

'Martyrs of Spain' (1870); 'Against the Stream' (1873); 'The Bertram Family' (1876); 'Lapsed But Not Lost' (1881).

Charles, Jacques Alexander César, French scientist: b. Beaugency, France, 12 Nov. 1746; d. 7 April 1823. He lectured on physical science in Paris and in 1783 made with M. Robert the first ascent ever made in a balloon. A height of 7,000 feet was reached on this occasion.

Charles, R. H., Irish theologian and scholar: b. County Tyrone 6 Aug. 1855. He was educated at Queen's College, Belfast, and Trinity College, Dublin, and was admitted to the Anglican priesthood in 1883. He was curate of St. Mark's, Whitechapel, 1883-5; of St. Philip's, Kensington, 1885-6; and of St. Mark's, Kennington, 1886-9. Since 1898 he has been professor of biblical Greek at Trinity College, Dublin. He has published 'Forgiveness, and Other Sermons' (1886); 'Book of Enoch Translated From the Ethiopic' (1893); 'Ethiopic Text of Book of Jubilees' (1894); 'Book of the Secrets of Enoch' (1895); 'The Assumption of Moses' (1897), etc.

Charles Grandison, *The History of*, the title of an extremely prolix novel by Samuel Richardson, published in 1753.

Charles City, Iowa, a city and county-seat of Floyd County, on Cedar River, and on the Illinois Cent. and the Chicago, M. & St. P. R.R.'s. It is supplied with good water-power by the river and has a number of manufacturing interests. It is the seat of Charles City College, a co-educational institution, organized in 1891, under the auspices of the German Methodist Church, which had 246 students at the end of 1901. Pop. 4,227.

Charles City Cross-roads, Battle of. See GLENDALE, BATTLE OF.

Charles River, a river in Massachusetts, which flows into Boston harbor, dividing Boston from Charlestown. The source of the principal branch is a pond bordering on Hopkinton. It is navigable for lighters and large boats to Watertown, seven miles west of Boston.

Charles's Wain, a common name for the constellation of the Great Bear or Ursa Major. Originally instead of Charles's Wain, the name was "carl's" or "churl's wain," meaning the farmer's wagon. Since the time of Homer this constellation has been called a wagon; but since the 17th century the name has been associated with Charles I. and Charles II. Shakespeare calls it Charles's Wain.

Charleston, chär'lz-tön, Ill., county-seat of Coles County, situated at the junction of the Cleveland, C. C. & S. L. and the Toledo, S. L. & K. C. R.R.'s, 49 miles southeast of Decatur. It has manufactories of woolen goods, carriages, stoves, plows, brooms, and also flour-mills, banks, good schools, and several churches. Pop. (1900) 5,488.

Charleston, S. C., the chief city of the State, and largest on the Atlantic seaboard south of Chesapeake Bay, seat of Charleston County; on the Atlantic C. L. and Southern R.R. (Charleston & S. and South C. & Georgia) systems; 130 miles southeast of Columbia, the capital, and 82 miles north of Savannah. Pop. (1900) 55,807, over half colored.

CHARLESTON

Charleston lies on a peninsula, 10 or 12 miles long and 8 or 10 feet above high water, between the navigable Ashley and Cooper rivers, 2,100 yards and 1,400 yards wide respectively at the mouth; the latter reinforced by the Wando at the city, and the estuary of the three forming a magnificent landlocked harbor, six miles long by three wide, with 40 feet of water at the city,—one of the finest on the Atlantic coast.

The government jetties have scoured a channel across the bar to a mean depth already of 26 feet at low water, or 31 feet at mean high tide, which it is believed will be soon increased by several feet. There are about nine miles of available water front, most of the wharfage being on the Cooper, which is navigable 30 miles to the canal connecting it with the Santee, and so with the west and northwest of the State. Ocean traffic has been quick to follow the favorable new channel opened for it; besides the Clyde Line of steamships, which taps the Atlantic ports from Boston to Jacksonville, and includes Charleston, two ocean freight lines, in 1901, established terminal docks at the city, one to the West Indies and Central America. The prospects for a large commerce with those regions are favorable, Charleston as a distributing port saving the passage around Cape Hatteras out through the Gulf. The resemblance of the city's position to that of New York in its rivers and harbor is striking, and freight here is moved directly from vessel to freight cars, or *vice versa*, without lightering or trucking. The distances from the central West are also favorable, and for the first time in its history Charleston seems entering on a period of rapid growth. The government is aiding in this by its great new navy-yard projects. The naval station has been moved to Charleston, where a tract on the Cooper River about seven miles from the city has been bought; the plans contemplate an outlay of \$8,000,000 to \$10,000,000, and it will certainly not be less. The harbor is defended by the historic Fort Moultrie, at Sullivan's Island on the eastern side, which the government is improving into one of the best equipped defenses on the coast at a cost of some \$500,000; by Fort Sumter on a small island in the centre; and batteries Sergeant Jasper (from a Revolutionary hero) and Capron. Fort Wagner, Fort Ripley, and Castle Pinckney, once celebrated, are now abandoned.

Trade and Commerce.—The Civil War nearly ruined Charleston's commerce, which consisted mainly in exports of cotton (it stood third in the United States, next to New York and New Orleans), rice, and naval stores, to the amount of some \$17,000,000 at the time of the War. The silting up of docks, decay of wharves, and destruction of railroads, were repaired slowly, and the commerce which had found new outlets was reclaimed; the total in 1901 being but \$7,084,215, of which \$6,728,665 was cotton, the remainder being cotton goods, rice, naval stores, and turpentine casks, lumber, phosphate fertilizers, fruits and vegetables. Charleston has a very valuable staple in the Sea Island cotton, with its long fibre, which grows in most perfection on the islands near the city; the raising of fruits and early vege-

tables for Northern markets also relies on Charleston's shipping facilities.

Manufactures.—The great manufacture of Charleston is fertilizers, from the inexhaustible beds of phosphate rock in the vicinity, discovered by Dr. St. Julien Ravenel some time after the War: out of a total manufactured product valued at \$9,562,387 in 1900, \$3,967,090 was of phosphates, none other amounting to \$500,000. From May 1901 to May 1902, the shipment of manufactured fertilizers was 296,646 carloads; there were 11 establishments, with a capital embarked of \$7,868,639, employing 1,409 people besides stockholders, paying \$488,842 in wages and salaries, and \$2,238,615 for materials. Of the other industries, besides domestic and jobbing ones, like food, clothing, plumbing, etc., the chief were of tobacco products, foundry and machine-shop work, cotton compressing, and oil and rice milling, bagging factories, cigar factories; making baskets to ship fruit and vegetables in, and casks for turpentine; ice, soap, beer, and mineral waters.

Interior, Buildings, Suburbs, etc.—Charleston's long existence for an American city, and its position of leadership in all political movements as well as vital importance in war time, give it much historical interest; and its old garden-set mansions and surroundings are often of great beauty in themselves. It is laid out generally at right angles, but with some picturesque irregularities in the streets; four of these, King Street, the principal retail thoroughfare; Meeting Street; and Rutledge and Ashley avenues, run the entire length of the city, north and south. King Street ends in White Point Garden, a handsome wooded park containing monuments to Sergeant John Jasper and William Gilmore Sims; east of this is the Battery, a broad esplanade 1,500 feet long, affording a noble view of the harbor and the forts. At the junction of Broad and Meeting streets are grouped the public buildings, consisting of the court-house, a solid brick building; the city hall, an imposing structure entered by a double flight of steps, and containing a historical museum with valuable relics; and the new post-office, a magnificent four-story building of Carolina granite, with a tower and all modern appliances, costing about \$500,000. The United States custom-house, near Market wharf on the Cooper River, is a superb structure of white marble, costing some \$3,000,000. In front of the city hall is Washington Park, containing two handsome fountains and a statue of William Pitt, erected before the Revolution—the British shot off one of the arms in 1780. There are monuments also to the Confederate dead and to John C. Calhoun, and a bust of Henry Timrod, the poet.

The Ashley is crossed by two bridges: that of the Charleston & S. R.R., and a toll-bridge known as the "New Bridge." Charleston has one of the best electric street railways in the country, having some 30 miles of track within the city limits, connecting with Chicora Park, about four miles from the city, on the Cooper, and with the Isle of Palms, a magnificent seaside resort about 10 miles north of the harbor. It also runs to the suburb of Mount Pleasant, across the Cooper, and eastern side of the harbor, and to Sullivan's Island, about

CHARLESTON

three miles off, where is a fine bathing beach. Magnolia Gardens, 12 miles west on the Ashley, is a popular summer resort, but the chief one is Summerville, 22 miles northwest, with a dry, cool climate. Of the open spaces near the city, Magnolia Cemetery at the north end, beautifully kept with flowers and shrubs, and with many fine monuments, is the chief. The city has a complete system of tidal drainage, and is in excellent sanitary condition.

Education.—The public-school system, established in 1810, had in 1902, six school buildings, about 100 teachers, and a total attendance of about 7,750, 4,200 colored; besides some 800 in private and parish schools. For higher education, the chief institutions are Charleston College, chartered in 1785, with a museum of natural history and a library; the South Carolina Military Academy, a State institution, established in 1843, one of the foremost military schools in the country, and famed for the active part its students took in the Civil War; Porter Military Academy, including Porter Manual Training Institute; the State Medical College, chartered in 1852; the Charleston and Memminger High Schools; the Academy of Our Lady of Mercy; Smith's School for Young Ladies; University School; and the Avery Normal Institute and the Wallingford Academy for Colored Youth.

Churches and Charitable Institutions.—There are over 60 churches in Charleston, the leading denominations being the Protestant Episcopal and the Presbyterian. It is a Roman Catholic bishop's see, and has a cathedral, St. Finbar's, rebuilt in 1890. The oldest church building is St. Michael's (P. E.), dating from 1761, with a fine chime, of interesting history; the oldest organization, however, is St. Philip's (P. E.), whose building was burned in the great fire of 1835, and whose present one is a Gothic structure of great beauty and originality, with a steeple nearly 200 feet high, bearing at night a beacon, visible far out at sea; and with a churchyard full of distinguished names, including Calhoun, Gadsden, Rutledge, and Pinckney. The Circular Church (Congregational) is also noted; among others of interest are: Grace (P. E.), the Scotch, the Second, and Westminster (Presbyterian), Citadel Square (Baptist), the Old Huguenot, Unitarian, Bethel, and Trinity Methodist, and the Hebrew Synagogue. Of the charitable institutions, the most important are the Orphan House, founded in 1792, the oldest of its kind in the United States; the Euston Home for the Aged; Home for Mothers, Widows and Daughters of Confederate Soldiers; the City and the Roper hospitals; the almshouse; and the Old Folks' Home for Aged Colored People. Among charitable societies are St. Andrew's Society, founded by Scotchmen in 1720, the oldest society in the city; and the South Carolina Society, founded by Huguenots in 1736,—renamed from the Two-Bit Club, so called from the sum contributed by each member at each meeting for the relief of their own indigent.

Banks.—In 1900 there were 3 national and 13 savings and State banks, with an aggregate capital and surplus of over \$2,700,000. There were also 14 building and loan associations in

active operation, with aggregate capital amounting to about \$1,500,000.

Government and Finances.—The government is, by the charter of 1836: a four-years' mayor and a council elected half by wards and half at large. The administrative boards and officials are partly appointive by the mayor and partly elective by the council. The city expenses are about \$600,000 a year, of which \$60,000 each goes for schools and charities, \$75,000 for police, and \$50,000 for the fire department. The net debt is about \$3,800,000; the assessed valuation of all taxable property, \$17,300,000, of which \$12,400,000 is real estate; the city tax rate is \$26.50 per \$1,000, besides a school tax of \$1 and a State and county tax of \$10.62½.

Population.—In 1790, the first census, 16,359; 1800, 18,924; 1810, 24,711; 1820, 24,780; 1830, 30,289; 1840, 29,261; 1850, 42,985; 1860, 40,522; 1870, 48,956; 1880, 49,984; 1890, 54,955; 1900, 55,807; of which 31,522 were negro.

History.—The first settlement in South Carolina was made at Port Royal by the French, in 1562; it was not successful, but they never forgot the experiment or their favor for the region. In 1670 an English colony under Gov. William Sayle made for Port Royal also; but on the advice of the cacique of Kiawah (the then name of the Ashley), settled instead at Albemarle Point, on the west bank of the Kiawah, three miles from the present site,—fortunately, as the colony Lord Cardross planted at Port Royal was exterminated by the Spaniards in 1686. The settlement was named Charles Town after Charles II. Within two years the settlers had discovered that Oyster Point, the end of the Charleston peninsula, was a better site, and in 10 the latter had become the main settlement and the offices were removed there. The first village was on the Cooper entirely, as the main business still is. The commerce even at this early date was lively, 16 vessels sometimes discharging at once. In 1685-6 a colony of Huguenot refugees settled there and built a church: this strain has deeply molded Charleston and South Carolina, and its fiery zeal in heading every political movement is perhaps due to this quick French blood. In 1704 there were five churches: St. Philip's, the Huguenot, the First Baptist, a Presbyterian and Congregational meeting-house, and a Quaker one. In August 1706 an allied French and Spanish fleet attacked it, but were driven off by a small improvised fleet under Lieut.-Gov. Rhett; shortly afterward another French vessel, unaware of the others' defeat, came up and landed a party, which was routed with heavy loss, and the survivors, with the ship and the rest of the marines, captured. The city at this time was desolated with yellow fever, but this militia action counts among the brilliant feats of the War of the Succession. In 1755 a colony of 1,200 deported Acadians settled there, still further reinforcing the French element. In 1773, Josiah Quincy of Boston writes in his diary that the town was "beautiful and in many respects magnificent"; and "far surpassed everything he ever saw or expected to see in America." It was at this time the third seaport in size in America, and in 1774 established a chamber of commerce. It

CHARLESTON — CHARLEVOIX

was not only the first Southern city to join the Revolutionary movement, but was the prime agent in bringing about the first provincial congress 10 years before; it held the first constitutional convention in any colony in March 1776, and promulgated an independent constitution. On 28 June the British fleet, under Sir Peter Parker, besieged the city, and was beaten off with terrible loss by the garrison of Fort Moultrie behind an improvised palmetto fortification. In 1779 a second attack under Gen. Augustine Prevost was defeated. But on 12 May 1780 Sir Henry Clinton with 16,000 men captured it and its garrison of 7,000 under Gen. Lincoln, after a six weeks' siege; it was not reoccupied by the Americans till 14 Dec. 1782. In 1783 it was incorporated as a city, and remained the capital of South Carolina till 1790. In 1784 it exported the first bale of cotton sent from the United States to Europe. In 1793 some 500 French refugees from the massacres of San Domingo settled there. It was the heart of the nullification movement in 1832, as of all movements to oppose Federal authority first and last; and the Breckenridge convention of 1860 met here before adjourning to Baltimore. The convention which proclaimed the State's secession from the Union was held here 20 Dec. 1860. The Civil War was begun by its bombardment and capture of Fort Sumter on 12-13 April 1861; and from 7 April 1863 on, for nearly two years, the fort was incessantly besieged and steadily bombarded by the Union fleet, for the last 18 months it being only a heap of ruins, but impregnable. On 17 Feb. 1865, on the surrender of Columbia, Hardee evacuated the city and burned all public buildings, stores, and shipping, and the next day Foster and the union forces took possession. Despite its devastation and wreckage, it grew 21 per cent from 1860 to 1870, while it had fallen off in the previous decade,—a curious phenomenon. In 1886, on 31 August, the heaviest earthquake ever recorded in the United States destroyed several hundred buildings, and made three fourths of the whole uninhabitable, killed scores of people, and caused a property damage estimated at \$8,000,000. On 2 Dec. 1901 the South Carolina Interstate and West Indian Exposition was inaugurated in the city.

(For a compact sketch of its history, see Yates Snowden in Powell's 'Historic Towns of the Southern States'; in connection with State history, McCrady's three volumes of South Carolina history, 1897-1901.)

HENRY TUPPER,
Secretary Chamber of Commerce.

Charleston, W. Va., a city, capital of the State, and county-seat of Kanawha County, at the junction of the Kanawha and Elk rivers, on the Chesapeake & O., the Ohio Cent., and the Charleston, C., and Sutton R.R.'s, 130 miles south by west of Wheeling. It is an important commercial, lumber, and coal-mining centre, with steamer communications with all Ohio and Mississippi River ports. In 1900 it contained 119 manufacturing establishments, valued at \$1,371,807. It has extensive salt springs, State-house, custom-house, hospital and opera house, three national banks, several daily and weekly newspapers, and an assessed property

valuation of over \$4,000,000. Pop. (1900) 11,099.

Charleston Phosphate, a valuable fertilizer obtained at Charleston, S. C., and classed as "land" or "river" phosphate, the latter being procured by dredging. It was discovered in 1837 by Francis S. Holmes, but its value was not demonstrated until 1867. For over 20 years South Carolina was the chief source of the world's supply. In 1888 the phosphate rock was found in Florida, and later in several other States, including North Carolina and Tennessee. In 1897 nearly 1,000,000 tons were mined, of which Florida supplied fully a half, and South Carolina rather less. The river phosphate occurs in nodules washed out of the original Tertiary formations and ranging from a half inch to two feet in diameter. They usually contain 50 to 60 per cent of "bone phosphate." See FERTILIZERS.

Charlestown, Mass., since 1874 a part of the municipality of Boston, previously a separate city and seaport. The principal public buildings are the State prison, the hospital for the insane, a market-house, school houses and churches. One of the chief navy yards in the United States, occupying an area of about 100 acres, is in the southeast part of Charlestown. Charlestown was the scene of stirring events in the Revolutionary War. See BUNKER HILL, BATTLE OF.

Charlestown, South Africa, a town in the extreme north of Natal, on the railway from Durban to Johannesburg. It stands at a height of over 5,300 feet. Majuba Hill is four miles distant.

Charlestown, Va., a village and county-seat of Jefferson County: situated on a branch of the Baltimore & O. R.R., 10 miles southwest of Harper's Ferry. It is the centre of an agricultural region, is noted as being the place of trial and execution (2 Dec. 1859), of John Brown (q.v.), and has a national bank, several weekly newspapers, and an assessed property valuation of about \$1,000,000. Pop. (1900) 2,392.

Charlet, Nicolas Toussaint, nîk-ô-lâ too-sân shar-lâ, French painter and engraver: b. Paris 20 Dec. 1792; d. Paris 29 Oct. 1845. He held a clerkship under the Empire, but lost it at the Restoration (1815), and afterward devoted himself to art. After studying awhile under Gros, he gradually formed for himself a style in which he had no rival. He was especially successful in his sketches of children and military incidents. His drawings numbered about 2,000.

Charleville, shâr-lê-vêl, France, a town in the department of Ardennes, on the left bank of the Meuse, opposite Mézières, with which it communicates by a suspension bridge. It is regularly built, has straight, wide, and clean streets, and a public square and fountain, surrounded by arcades, from which the four principal streets diverge. It carries on various industries: and the Meuse affords facilities for a large traffic. Charleville was built in 1606 by Charles, Duke of Nevers and Mantua, and named after himself. Pop. (1891) 17,390.

Charlevoix, Pierre François Xavier de, pē-âr frañ-swâ ksäv-ê-â de shâr-lê-vwâ

CHARLEY — CHARM

French Jesuit traveler: b. St. Quentin 29 Oct. 1682; d. La Flèche 1 Feb. 1761. He twice visited Canada, and voyaged down the Mississippi to New Orleans. He published his journal, histories of San Domingo, Japan, and Paraguay, and a 'History of New France.' He wrote also a 'Life of Blessed Mary of the Incarnation,' the foundress of the Ursuline nuns in America.

Charley, Sir William Thomas, English jurist (retired since 1892): b. Woodbourne 5 March 1833. He has published 'The Judicature Acts' (1873-5); 'The Real Property Acts' (1874-7); 'The Crusade Against the Constitution, an Historical Vindication of the House of Lords' (1895); 'Mending and Ending of the House of Lords' (1900).

Char'lock, a small, cruciferous plant with yellow flowers, commonly called wild mustard. See **MUSTARD**.

Char'lotte Augusta, Princess, daughter of Queen Caroline and George IV.: b. Carlton House 7 Jan. 1796; d. 5 Nov. 1817. She was carefully educated and highly accomplished. In 1816 she married Prince Leopold of Coburg, afterward King of the Belgians.

Charlotte, shär'löt, N. C., a city and county-seat of Mecklenburg County, on Sugar Creek, the Southern and the Seaboard A. L. R.R.'s, 226 miles northeast of Atlanta, Ga. It is the trade centre of Mecklenburg and surrounding counties, and also the centre of the Southern cotton-mill industry, having 100 mills within a radius of 200 miles; is the seat of Biddle University and a military institute; has several churches, parks, opera houses, public library, four national banks, and several weekly newspapers. The Mecklenburg Declaration of Independence was adopted here in 1775, and the city was occupied by the British in 1780; assessed property valuation, about \$5,000,000. Pop. (1900) 18,091.

Charlotte Amalie, shär-löt' ä-mä'lë-ë, Danish West Indies, capital city of the island of St. Thomas. It has an excellent harbor, landlocked from all winds, contains several churches, and is an entrepôt for goods for the neighboring islands. Pop. 9,000.

Charlotte Harbor, Florida, the mouth of the Peace River, in De Soto County, in the southwestern part of the State. This harbor is very shallow, not exceeding in depth more than 10 feet; it extends inland 24 miles. It is protected on the west side by a long chain of islands.

Charlottenburg, shär-löt'tën-boorg, Prussia, adjoining Berlin on the west, and now practically forming part of it, on the banks of the river Spree. It contains a palace built for Sophia Charlotte, the first queen of Prussia, which was begun at the end of the 17th century—hence the name of the place. The town was founded soon after, but made little progress until the middle of the 19th century. Since then it has made extraordinary progress, having shared in the prosperity and extension which the capital has experienced. The town contains various important educational and other institutions, including a school of artillery and engineering, and a technical high school. Among the churches is the Kaiser Wilhelm

Memorial Church, consecrated in 1895. A beautiful walk starting from the Brandenburg gate, at the head of the famous Berlin Street, *Unter den Linden*, and passing through the park known as the *Thiergarten*, ends here. Charlottenburg is a favorite resort and residence of the Berlinese. In the garden adjoining the castle is the tomb of Frederick William III. and his consort Queen Louisa, by Rauch. Here also their son, the Emperor William I., was buried in 1888. Pop. (1900) 189,290.

Charlottesville, shär'löts-vil, Va., the county-seat of Albemarle County, is on the Chesapeake & O. and the Southern R.R.'s, 96 miles southwest of Washington. It is the seat of the University of Virginia and of Monticello, the home of Thomas Jefferson; is a popular summer resort; has important manufactures, electric lights and street railways, a national bank, several daily and weekly newspapers, and an assessed property valuation of over \$1,500,000. Pop. (1900) 6,449.

Charlottetown, shär'löt-town, Prince Edward Island, Canada, capital of the province, situated in Queen's County, on Hillsborough Bay, at the confluence of three rivers, and on the Prince E. I. R.R. The city is well laid out, and has an excellent harbor, a fine colonial building, post-office, Y. M. C. A. building, and an insane asylum. It is the seat of Prince of Wales College, St. Dunstan's College, and a Methodist college; has a high school, a business college, and several common schools, and many industries, including foundries, machine shops, carriage and furniture factories, breweries, etc. Charlottetown is connected with various parts of the Dominion by steamship lines. It is lighted by gas and electricity; has an extensive waterworks system, several daily and weekly newspapers, and banks, and is the see of a Roman Catholic bishop. Pop. (1901) 12,080.

Charlton, chär'l'tön, John, Canadian statesman: b. near Caledonia, N. Y., 3 Feb. 1829. He was in early life a clerk, but removed to Canada in 1849, and entered business and political life. He was elected as a Liberal to the Canadian House of Commons in 1872, and has held his seat continuously since then. He is best known as a promoter of moral legislation. He has published 'Parliamentary Recollections.'

Charlton, John, English artist: b. Bamf borough, Northumberland, England, 28 June 1849. He studied art at Newcastle and South Kensington, and beginning to exhibit at the Royal Academy in 1870 has exhibited there regularly since that date. Among important works of his are 'Stag at Bay'; 'Reynard's Requiem'; 'God Save the Queen'; 'The Funeral of Queen Victoria.'

Charm, anything believed to possess some occult or supernatural power, such as an amulet, spell, etc., but properly applied (as the name, derived from Lat. *carmen*, a song, indicates) to spells couched in formulas of words or verses.

Among celebrated charms the Danish Danebrog, or national banner, stands prominent. This banner was said to have been woven in a

CHARMIAN — CHARPENTIER

day and a night by three daughters of a celebrated Norse chieftain, of the race of Ynglings, said to be descended from the god Odin. These girls were deeply versed in the lore of the gods, giants, dwarfs, and norns, and in the centre of the banner they placed a raven, the bird of Odin, wonderfully lifelike and realistic. The superstition was that the result of a battle was foretold by this raven, which if victory was to fall to the possessors of the banner, held its head and bill in an upright position.

By observing this banner the Danes in three years' time had won 27 important battles, going into action only when the raven looked skyward. If the bird looked droopy and held its head low, they remained in camp, or, if in action, and the attitude of the raven suddenly changed, they withdrew from the field.

Alfred, the king of the English Saxons, noting the enthusiasm which this banner inspired in the Danes, determined to capture it, and succeeded after a savage battle in which the Danes fought desperately for three hours. When, however, it fell into the hands of the Saxons, and the head and wings of the raven drooped, there was a general rout. The Danes were models of courage and bravery as long as superstition fanned the fire of faith in their hearts, but they were arrant cowards the minute they realized that their idol was powerless to protect them.

Another curious charm is to be seen in the National Museum at Washington. This is a necklace of human fingers which was captured from the Sioux Indians in 1876, the loss of which brought about the subjection of the Indians.

Charmian, kār'mī-an, an attendant on Cleopatra in Shakespeare's 'Antony and Cleopatra.' After Cleopatra's suicide, Charmian also made away with herself.

Charnay, Claude Joseph Désiré, klōd zhō zēf dā-zē-rā shar-nā, French traveler: b. Fleuieux 2 May 1828. In 1857-61 he traveled in Mexico in behalf of the French ministry of education; from 1863 to 1878 he went on a number of expeditions to North and South America, Australia, and other countries. In 1880 he conducted an expedition to the ruined cities of Mexico, the expense of which was borne by Pierre Lorillard; and in 1886 again visited Yucatan. He has written 'Le Mexique, Souvenirs et Impressions de Voyage'; and 'Les Anciennes Villes du Nouveau Monde' (translated into English).

Char'nel-house, a chamber or building under or near churches, where the bones of the dead are deposited. In England the crypts of some churches were formerly used as charnel-houses.

Charon, kā'rōn, in mythology, the son of Erebus and Night. It was his office to ferry the dead in his crazy boat over the dark waters of Acheron, over Cocytus resounding with the doleful lamentations of the dead, and finally over the Styx, dreaded even by the immortals. The shades were each obliged to pay him an obolus, which was put, at the time of the burial, into the mouth of the deceased. Those who could not pay the fare, or had been so unfor-

tunate as to find no grave in the upper world, were compelled to wander on the desolate banks of the Acheron till Charon was pleased to carry them over to their final resting-place. He was represented as an old man, with a gloomy aspect, matted beard, and tattered garments. The traditions relative to Charon are posterior to the Homeric age, and it is thought by some of the learned that the myth was imported into Greece from Egypt.

Charost, Armand Joseph de Bethune, ār-mān zhō-zēf dē bā-toon sha-rōst, DUKE OF: b. Versailles 1728; d. 27 Oct. 1800. He was a descendant of Sully, and distinguished himself on many occasions in the military service of his country. He was particularly active in the promotion of agriculture and public institutions. Long before the Revolution he abolished the feudal services on his estates, and wrote against feudal institutions. He established charitable institutions in sundry parishes, provided for the support and instruction of orphans, employed physicians and midwives, founded and liberally endowed a hospital. In a year of dearth he imported grain into Calais at his own expense. In the provincial assemblies he spoke against the *corvées*. In the assembly of the notables he declared himself for an equal distribution of the public burdens. During the Reign of Terror he retired to Meillant, where he was arrested, and did not obtain his liberty until after the 9th Thermidor. In the testimonies given in his behalf by the revolutionary committees he was called the father and benefactor of suffering humanity. He returned to Meillant, where he established an agricultural society. No sacrifice was too great for him, and his vast fortune was scarcely sufficient for his enterprises.

Charpentier, François Philippe, frān-swā fē-lēp shar-pān-tē-ā, French engraver and mechanic: b. Blois 3 Oct. 1734; d. there 22 July 1817. He studied copper engraving in Paris, and invented the aquatint process in engraving. Among his engravings by this process are 'Perseus and Andromeda'; 'The Beheading of John the Baptist'; 'A Shepherd'; 'The Italian Concert'; and 'The Children's Bacchanal' after De Witt. On account of his invention he was given the position of royal mechanic; in this capacity he perfected the lamps of light-houses and devised a number of improvements in cannon and other firearms.

Charpentier, Gustave, French composer: b. Dieuze 1860. He was a pupil of Pessard and Massenet at the Paris conservatory; and won the grand prix de Rome in 1887. He has written a number of songs: 'Napoli,' a symphony; 'The Life of a Poet,' a symphonic drama; and an opera, 'Louise.' For the two latter he wrote both words and music.

Charpentier, Johann Friedrich Wilhelm Toussaint, German mining engineer: b. Dresden 24 June 1738; d. Freiberg 27 July 1805. He studied law and mathematics at Leipsic, then took a position as instructor in mathematics at the mining school of Freiberg, where he devoted himself to the study of mining methods. He investigated the improved process of amalgamation used in Hungary and introduced it in Germany, besides furthering a number of other improvements. He wrote

'Mineralogische Geographie der Kursächsischen Lande' (1778); 'Beiträge zur Geognostischen Kenntnis des Riesengebirges Slesischen Anteils' (1804).

Charpentier, Louis Eugène, loo-ē ē-zhān, French painter: b. Paris 1 June 1811; d. 7 Dec. 1890. He was a pupil of Gerard and Cogniet, and was professor of design at the Lycee at Versailles for over 20 years. He was best known as a military painter. His first picture of importance was 'Bivouac of the Cuirassiers'; among other of his works are 'Halt of the French Army on the Saint Bernard'; 'Battle of Tchernai'; 'Imperial Guard of Magenta'; 'Retreat from Inkermann'; 'Wellington in Spain'; 'Charge of Cuirassiers at Waterloo.'

Charpentier, Marc Antoine, French composer: b. Paris 1634; d. there March 1702. He went to Rome with the intention of studying painting, but turned his attention to music and became a pupil of Carissimi. Returning to Paris he held the position of chapel-master at several places, finally at the Sainte Chapelle. He was the most prominent rival of Lully. He wrote several operas, 'Tragédies Spirituelles' for the Jesuit order, and a number of pastorales.

Charpie, shār-pē. See LINT.

Charpoy, char'poi, in the East Indies, a small, portable bed, consisting of a wooden frame resting on four legs, with bands across to support the bedding.

Charqui, chār'kē, jerked beef, the Chilean name of which the English term is a corruption.

Charras, shar-rā, **Jean Baptiste Adolphe**, a French republican soldier and statesman: b. Pfalzburg, Lorraine, 7 June 1810; d. Basel, Switzerland, 23 Jan. 1865. He took part in the revolution of 1830, was promoted in 1833 to the rank of lieutenant, wrote a series of able articles in the 'National' on military affairs, which gave umbrage to the government and caused him to be sent to Algeria; distinguished himself there on the battlefield as well as in the training of native troops and the colonization of the country. After the revolution of 1848 he became under-secretary of state and representative for the department of Puy de Dôme. He was one of the victims of the *coup d'état* of 2 Dec. 1851. First detained at Ham, he was transported to Belgium in 1852, but expelled from that country in November 1854, at the request of Louis Napoleon, whom Charras had denounced on many occasions, but most effectively in a letter of which 50,000 copies were printed in Belgium alone. A remarkable work from his pen, 'Histoire de la campagne de 1815,' appeared in 1857.

Charras, chār'ras or chūr'ras, a resinous substance which exudes from the Indian hemp and is collected for use as a narcotic or intoxicant, forming a considerable article of trade in Asia. See HEMP.

Charriere, shār-rē-ār, **Madame St. Hyacinthe de**, French authoress, well known under the assumed name of the ABBÉ DE LA TOUR: b. Holland about 1740; d. 20 Dec. 1805. In early life she became a maid of honor at the court of the Stadtholder. Her affection for

her brother's tutor, M. de Charrière, a worthy but decayed nobleman, led her to forego her rank and family, and shortly after her marriage she retired with him to a small property at Neufchâtel. Her lively temperament was ill suited for the monotony of a rustic life, and accordingly seeking amusement in literary recreations she soon acquired a considerable reputation. Having lost the greater part of her fortune in the French Revolution, she reduced her expenditure to the lowest possible amount, that she might be able to continue her various acts of benevolence. Her works belong chiefly to the class of light literature. Among others may be mentioned 'Les Trois Femmes'; and the favorite dramas of 'Le Toi et le Vous'; 'L'Emigré'; 'L'Enfant Gâté'; and 'Comment le nomme-t-on.' All these productions not only display much wit, truth, and powerful description, but also breathe a spirit of philosophy, and have a strong moral tendency. Most of them were translated into German by her friend Herder.

Charron, Pierre, pē-ār shā-rôn, French preacher and writer: b. Paris 1541; d. 16 Nov. 1603. He studied law at Orleans and Bourges, and had practised for six years as a parliamentary advocate when he turned his attention to theology, and gained so much fame by his sermons that he was presented in rapid succession with several benefices in Gascogne and Languedoc, and appointed court chaplain to Queen Margaret. In 1588 he returned to Paris with the view of fulfilling a vow he had made to enter the Carthusian order, but owing to his age the prior of the order refused him admission, and the Celestines also declining to receive him, he continued a secular priest. In 1589 he went to Bordeaux and became very intimate with Montaigne, whom he tried to imitate, though he failed to catch his ease of style, and original, piquant wit. His principal works are 'Traité des Trois Vérités,' and 'Traité de la Sagesse.' The Roman Catholic zeal of the former drew down upon him the rebuke of Duplessis-Mornay; and the extreme liberalism of the latter exposed him to a charge of atheism, the treatise being condemned both by Parliament and the University.

Chart, a representation of a portion of the earth's surface projected on a plane. The term is commonly restricted to those intended for navigators' use, on which merely the outlines of coasts, islands, etc., are represented. A globular chart is a chart constructed on a globular projection. A Mercator's chart is a chart on the projection of Mercator. A plane chart is a representation of some part of the superficies of the earth, in which the spherical form is disregarded, the meridians drawn parallel, the parallels of latitude at equal distances, and the degrees of latitude and longitude equal. A selengraphical chart is a chart representing the surface of the moon; and a topographical chart is a chart of a particular place, or of a small part of the earth.

Charts are designed to assist the navigator and to subserve the interests of commerce. For purposes of navigation they may embrace large areas, like one of the great oceans or seas, delineating the conformation of the shores and outlying dangers, and perhaps indicating the principal currents and winds that may be utilized

CHARTA — CHARTE

in determining the most advantageous routes between specified localities. Charts may also embrace much smaller areas, but on larger scales, permitting greater fullness of detail, and thus presenting graphically the channels that can be followed, with the depths of water, the position of lights, beacons, spindles, buoys, and other objects provided to indicate the way to the stranger. Charts of these classes are usually designated "Navigation charts," although they may also be useful for other purposes.

Nearly all civilized nations have published charts of their coast lines in greater or less detail, and the principal maritime nations copy those issued by other nations, and thus maintain for the use of their own seamen charts of all parts of the world to which their commerce may extend. Great Britain maintains the most extensive establishment for the purpose, and issues the most complete series of charts; she has also made the most extensive surveys of uncivilized coasts for cartographic purposes.

The United States Coast Survey, a vast undertaking, was begun in 1807, carried on intermittently till 1845, and since then more systematically, save during the Civil War, under Prof. Bache, Prof. Pierce, and their successors. The coasts of the United States are surveyed and the charts produced by the Coast and Geodetic Survey attached to the Treasury Department, which also makes researches to determine the origin and courses of the Gulf Stream (q.v.). Unsurveyed foreign coasts are surveyed by the Bureau of Navigation, the charts being produced by the Hydrographic Office of the Navy Department. This bureau also duplicates charts and plans issued by other nations. The Coast and Geodetic charts are sold at from 10 cents to \$1 each, being the cost of printing and paper. Naval vessels are supplied free. The charts are obtainable at Coast and Geodetic Survey agencies at all seaports of the United States. They exhibit accurate and minute topography as far inland as will supply landmarks for the navigator or serve for purposes of defense; the shore line at high water, and sanding to mean low water; soundings, contours, and material of bottom at different depths; bars, channels, sailing ranges and directions; true meridian and compass variation; rocks, reefs, buoys, beacons, lights; tide establishment; detailed explanation of lighthouses and signal stations. They are carefully corrected for every substantial change in any of those features. They range in scale from $\frac{1}{34000}$ (30,401 inches to the nautical mile) to $\frac{1}{1000000}$ ($\frac{1}{1000}$ of an inch to the nautical mile). The Coast and Geodetic Survey issues four series of charts on the Atlantic and Gulf coasts of the United States, and three series on the Pacific coast, designed to subserve the purposes the surveys were established to meet. The first series includes "sailing charts," which embrace long stretches of coast, as from the Bay of Fundy to Cape Hatteras, Chesapeake Bay to the Bahamas, etc., and are intended to serve for offshore navigation, or between the greater headlands, as Cape Cod, Cape Hatteras, etc., and between distant harbors, as Boston to Chesapeake Bay, Charleston, etc. They show only the outline of the continent, the seacoast lights, and geographic information that will be useful for the purposes intended. The second series includes "general charts of the coast,"

also designed for purposes of navigation. They are on a scale three times as large as that of the first series, and embrace more limited areas, as the Gulf of Maine, Gay Head to Cape Henlopen, Galveston to the Rio Grande, etc. These charts serve the navigator in coasting along-shore between headlands, and in approaching harbors. Those of the third series, called "coast charts," embrace the whole coast on a uniform scale five times as large as that of the second series. Such charts are necessarily confined to comparatively short stretches of coast, as Sandy Hook to Barnegat, the entrance to Chesapeake Bay, Mobile Bay, etc. One inch on the paper represents about $1\frac{1}{4}$ statute miles, a scale sufficiently large to give the features of the topography and hydrography with great clearness, portraying the appearance of the coast and the irregularities of the bottom with a detail quite close enough for the navigation of the principal harbors. The fourth series consists of "harbor charts" on large scales, intended to meet the needs of local navigation. On the Pacific coast the first series is similar to that on the Atlantic coast, and extends from San Diego, Cal., to Point Barrow, Alaska. The second series is on a scale six times as large as the first, and is suitable for alongshore navigation and inland passages of southeast Alaska. The third series includes charts on scales like those of the fourth series on the Atlantic coast.

All these series of charts are published from the same original surveys, the details of the original work being generalized or omitted to meet the requirements any particular series is intended to subserve. Various methods are available for producing charts of these classes, but experience has demonstrated that on coasts like large portions of those of the United States, which are subject to frequent changes from natural causes, necessitating extensive corrections, engravings upon copper are the most expedient and economical. The engravings afford the additional advantage of being readily duplicated by the electrotyping process. All the standard charts issued by the bureau are therefore copperplate engravings. Preliminary editions, however, are frequently issued by means of the photo-lithographic process, which affords a cheap and ready method for temporary purposes.

The Survey publishes about 500 charts, with an average annual issue of 70,000 copies.

Char'ta, Magna. See MAGNA CHARTA.

Charte, shärt, a term originally used to indicate the rights and privileges granted by the French kings to various towns and communities. The first such charter in France is known as the *Grande Charte*, or the Charter of King John (1355). At present by the Charte is meant the fundamental law of the French monarchy, as established on the restoration of Louis XVIII. in 1814. As is well known, it was the violation of an article of the Charte by the ministers of Charles X. that led to the revolution of 1830, the expulsion of that monarch from the throne, and the accession of Louis Philippe, who, on 29 Aug. 1830, swore to a new charter, sensibly modifying that of 1814 in a liberal sense. After 18 years' sway, Louis Philippe was himself expelled from France, 24 Feb. 1848, and therewith the Charte which he was called to support fell to the ground.

CHARTER—CHARTER-HOUSE

Charter, a document by which a superior power grants permanent or continuing rights and privileges to an inferior, either a person or persons, corporation or institution, colony, municipality, etc. Originally it had the broader sense, now obsolete, of a conveyance of land. The mediæval charters ranged from a grant of political rights by a sovereign to an entire people,—like the Great Charter of England or the Golden Bull of Hungary, or colonial instruments of government conferring the broadest rights of sovereignty,—down to permissive acts for abbeys and colleges or trading companies, or confirmations of rights already given (called confirmatory charters). The first-named class in modern usage is called a constitution. Thus, the agreements by which recent monarchs have deprived themselves or been deprived of absolute power and shared it with their people, as with Austria in 1866, Japan in 1868, etc., are essentially the same as *Magna Charta*. Charters in present usage are restricted to municipalities, corporations, and institutions.

The charters for the American colonies were usually distinguished from "patents" by granting specific privileges of jurisdiction and legislation, and in general the powers needed to establish and continue a self-regulating community, instead of mere general grants of land and rights of settlement; but the two were often loosely used as interchangeable. Thus, in the acknowledgment of receipt of their charter in 1662, the Connecticut officials acknowledge also the "old charter," meaning the Warwick Patent. Strictly, they were all patents, as granted by the king under letters patent; but in use, only the grants to individuals were commonly termed patents, the word charter being reserved for those to companies and to colonies already established. Of these three species, the first includes the patents to Lord Baltimore for Maryland in 1632, to Gorges for Maine in 1639, to the Duke of York (afterward James II.) for New York in 1664, and to William Penn for Pennsylvania in 1681. The second comprises those to the Virginia Company in 1606, 1609, and 1612, the Plymouth and London companies in 1606, the Council for New England in 1620, the Massachusetts Bay Company in 1629, the proprietors of Carolina (1663) and Georgia (1732). The third has the two exemplars of Rhode Island (1643, confirmed 1663), and Connecticut (1662): instruments of such complete self-government that those States made no change at the Revolution, the former living under its 17th-century charter till 1818, and the latter till it was forced to change it by the Dorr Rebellion of 1842. The legal nature and implications of these documents were keenly disputed in the age when their interpretation was vital, and have been argued with scarcely less heat for historical reasons since. According to the English view, they were concessions granted by the government for political reasons, and revocable at its pleasure for the same reasons; the title to the lands as well as to the political privileges lay with the government, and its right to vacate either was limited only by policy; and charter governments had only such powers as were specifically given them in the charters. James II. put some of these theories in practice in the union of New England in 1685, and others were acted upon generally. On

the other hand the colonial view was set forth by Jeremiah Dummer in his 'Defense of the Charters' (1728); at least it was widely adopted. It was, that the charters were compacts between the government and the colonies, in consideration of the latter having cleared and taken possession of the territory and annexed it to the crown; and that the crown possessed only political rights there, the land title being derived from purchase and occupation and their own courage and labor. As to the powers of the charter governments, Judge Story holds that they possessed full sovereignty and power of legislation and taxation, subject only to not contradicting the laws of the mother country. The truth is that neither side had any very definite views on the matter at the outset, and both developed antagonistic ones under the stress of interest.

In the United States, charters (special or general) are granted by acts of the several State legislatures or by the national government. Thus, the national banking act, and the general railroad acts of most States prescribe the conditions under which corporations of those classes may organize without special permission, and their articles of association are their charter. The act by which a county or township is set off as an administrative division of a State is not termed a charter. On the other hand, that by which a municipality is organized, as a city or borough, is always so termed; but it has the vital distinction from a private charter that it is not a contract; the municipality has no vested rights, being a mere governmental agency and convenience; and the charter can be altered or repealed at any time by the legislature. A private charter, on the other hand, is a contract which cannot be repealed or modified by the public power unless such liberty has been expressly reserved in the charter itself. See DARTMOUTH COLLEGE CASE.

Charter-house, a celebrated school and charitable foundation in London, England. In 1370 Sir Walter Manny and Northburgh, Bishop of London, built and endowed it as a priory for Carthusian monks (hence the name, a corruption of *Chartrouse*, the celebrated Carthusian convent). After the dissolution of the monasteries it passed through several hands till it came into the possession of Thomas Sutton, who converted it into an hospital, richly endowed, consisting of a master, preacher, head schoolmaster, with 44 boys and 80 indigent gentlemen, together with a physician and other officers and servants of the house. Each boy is educated at a certain expense, and each pensioner receives food, clothing, lodging, and an allowance of about \$150 a year. The pensioners, "poor brethren," must be over 50 years of age, and members of the Church of England. The Charter-house School has been removed to new buildings near Godalming, in Surrey, while the non-academic department of the Charter-house still remains in the old buildings. The school has a high reputation, and many lads are educated there other than the scholars properly so called. Several of the famous men who have received their education at the Charter-house are Isaac Barrow, Addison, Steele, John Wesley, Blackstone, Grote, Thirlwall, Havelock, John Leech and Thackeray.

CHARTER OAK

Charter Oak, a tree nearly seven feet in diameter, formerly in Hartford, Conn.; it blew down in a storm, 21 Aug. 1856. A section of its trunk was preserved in the rooms of the Connecticut Historical Society; the remainder—currently believed to rival in miraculous powers of reproduction the loaves and fishes or the Mayflower furniture—was kept or sold for small souvenirs. It is thus venerated from a tradition, first accredited to it in 1789, that in a hollow of it was concealed the charter of Connecticut rescued from Andros in 1687; earlier ones specify an elm, others the houses of different persons. This is of little moment; but the adventures of the charter form a mystery which the latest investigations, instead of illuminating, render utterly insoluble. The contradiction of unquestionable facts is absolute. The story without these is sufficiently peculiar. James II., wishing to make Connecticut a part of his consolidated New England under Andros (q.v.), found its charter in the way; and as the colony declined to surrender it, he brought writs of quo warranto to vacate it, the last of which was returnable in February 1687. To delay or avoid voluntary surrender, yet escape forfeiture and entire outlawry of rights, they replied that they would much rather stay as they were, but if they could not, preferred a provincial union under Andros over annexation to any other province. The Council chose to consider this a formal waiver of charter rights, and dropped proceedings under the writ; and on 31 Oct. 1687 Andros rode over from Norwich to Hartford, under orders to assume the government. Calling the governor and council together, he demanded surrender of the charter according to their dutiful assurances. The meeting was secret; what happened we learn only from tradition, and the brief account of a later intimate of the actors. The colonial officials protested and debated till after dark; that this was prearranged is not only morally certain in itself, but Trumbull's account of a long speech by the governor, to no conceivable purpose otherwise, deepens the certainty. Candles were lighted; the charter was (or the charters were) at last brought in and laid on the table; suddenly some officious candle-snuffers put out all the lights, and when they were relighted no charter was to be seen. But if Andros had no longer a charter to suppress, equally the colony had no longer one to appeal to; the old government was just as effectually extinguished as if they had let him have the paper, they cannot have foreseen a revolution in England, and it is not evident what they intended to do with it. Most likely, from their previous actions, it was merely to save their "face" from the humiliation of a formal surrender. There was no outcry by Andros, no charge made against the officials, no appearance of ill-will to them, no report of the affair to England, seemingly no disclosure of it to the train of Massachusetts magnates who accompanied him (and may or may not have attended the meeting), or to any one else; and (perhaps the most curious of all the circumstances of this curious affair) both our informant and tradition stop short at the relighted candles and the missing document, and give no hint what Andros said or if he said anything, or whether he seemed puzzled or offended, or any of the immediate sequelæ of the business. The gov-

ernor (Treat) had called a meeting of the General Court, which accepted the situation and the annexation; the secretary inscribed it on the colonial records and wrote "Finis" on them; and the next day Andros publicly proclaimed his commission. When James was overthrown and Andros with him, the colony resumed its government, appealed to its charter brought from hiding, and the English authorities admitted without trial that it had never been vacated. But that was chance and not foresight. This, however, is only the beginning of mystery. The charter, obtained by Gov. John Winthrop from Charles II.'s council in April 1662, was engrossed in duplicate, and the official fees are entered on the English records. No other copies were made, nor could have been unless both the others were lost; and neither was lost. The first copy was sent to the colonial government, which acknowledges receipt of "the charter, the duplicate and the old copy of the former charter" (that is, the Warwick Patent). Duplicate of what? It is usually assumed to mean, of the charter; but the facts to be cited prove that it was of the patent. Winthrop was to bring over the duplicate of the charter with him; and a legislative committee was appointed to receive it from him. That he did not, is conclusively shown by a letter from the colony to its agent, William Whiting, in 1686, instructing him to obtain it from James Porter in London, with whom Winthrop had left it, and use it in defending the colony's rights before the council. That Winthrop may have taken it across once more on official business, and left it there, is barred out by the fact that he never visited England again. That Whiting sent it back within the next year, is equally negated by the fact that he continued to need it there and the colony did not need it at all, that he would not have sent it without orders and they gave him no such orders, and that in his correspondence there is no letter of transmittal. Furthermore, a legislative committee of 1715 voted a money acknowledgment to Joseph Wadsworth for safely preserving the "Duplicate Charter" when "our constitution was struck at": it is absurd to suppose they made him the grant for preserving a second copy when they had one safe already. Obviously, the one he preserved was the only one they had. On the other hand, Roger Wolcott, the first narrator (1759), distinctly says that "the charters were set on the table," and that when the candles were relighted the *charters were gone*. Still more specifically, President Stiles of Yale writes in his Itinerary, as from Wolcott, that Nathan Stanley took one copy and Gov. Talcott's father the other. Wolcott was only eight at the time; but by 1714 he was in the council, in 1715 was on the very committee which made the grant to Wadsworth, and was certainly intimate with many who were present at the scene and probably helped arrange it. We have, then, the certain fact that there was but one copy of the charter in America in 1687, set against the positive assertion of one who must have known, that two were abstracted. Still a third mystery is, that Wadsworth was not present at the meeting and could not have taken the paper; that Wolcott, who publicly honored Wadsworth as the savior of the charter, privately gives all the credit to others and does not even mention Wadsworth,

CHARTER-PARTY — CHARTRAN

and that the names he cites are really those of members present; and that if one of the actual abstracters passed it to Wadsworth waiting outside, he and not they should receive the public acknowledgment. The writer can guess at solutions to these problems, but all solutions are guesses alike.

ALBERT C. BATES,
Librarian Connecticut Historical Society.

Charter-party, a contract executed by the freighter and the master or owner of a ship, containing the terms upon which the ship is hired to freight. The masters and owners usually bind themselves, the ship, tackle, and furniture, that the goods freighted shall be delivered (dangers of the sea excepted) well-conditioned at the place of the discharge; and they also covenant to equip the ship complete and adequate to the voyage. The charterer is bound to furnish the cargo at the place of lading, and to take delivery at the port of discharge within specified periods called lay days; and penalties are annexed to enforce the reciprocal covenants.

Char'teris, Archibald Hamilton, Scottish clergyman: b. Wamphay, Dumfriesshire, 13 Dec. 1835. He was educated in the University of Edinburgh, where in 1808, after holding two Presbyterian pastorates, he became professor of biblical criticism. In 1808 he was made professor emeritus. Since 1901 he has been chaplain-in-ordinary to King Edward VII. He has published 'Life of Professor James Robertson' (1863); 'Canonicity' (1881); 'The Christian Scripture' (1888).

Charters Towers, Australia, a mining township of Queensland, on the northern spurs of the Towers Mountain, 820 miles northwest of Brisbane. The place was first settled in 1871-2, when gold was discovered there. In 1877 it was incorporated as a town. Now it has railway connection with the coast by means of a railroad to Townsville. The yield from the gold fields, up to 1891, was 2,300,000 ounces. Pop. (1891) of the town, 4,597; of the field, 14,129.

Chartier, kâr-tê-â, Alain, French poet and moralist: b. Bayeux about 1392; d. about 1440. He was educated at the University of Paris, and was appointed by Charles VI. clerk, notary, and secretary of the royal household—posts which he held under Charles VII. His contemporaries considered him the father of French eloquence. Although far from handsome it is said that he received one day while asleep a kiss from Margaret of Scotland, wife of the dauphin, who explained her conduct to the surprised bystanders by saying that it was not the man she kissed, but the mouth whence flowed so many golden words. His poems are often graceful and nervous, and his vigorous prose contains many fine thoughts and prudent maxims. The first edition of his works which bears a date is that of 1489; the most esteemed that of 1617.

Chartism, a working-class movement in England, 1838-48, the primary purpose of which was the attainment of certain political reforms. The Reform Bill of 1832 had failed to bring the expected advantages to the working class; the new poor law of 1835 was unpopular; and a period of general commercial depression and a succession of bad harvests had increased the

sufferings of the people. The discontent resulting found definite expression in the "Charter" or "People's Charter" prepared in 1838 by a committee of six members of Parliament and six working-men. It comprised six heads, (1) Universal suffrage, or a right of voting conferred on every male of 21 years of age, of sound mind, unconvicted of crime, and a native of the United Kingdom, as well as to every foreigner possessing the same qualifications, who had been resident in the United Kingdom for more than two years; (2) equal electoral districts; (3) vote by ballot; (4) annual parliaments; (5) no other qualification to be necessary for members of Parliament than the choice of the electors; (6) members of Parliament to be paid for their services.

At first a portion of the middle class supported the movement, but they became estranged, and the Chartists became more and more a distinctively working-class party. The movement was not purely political; it was of a distinctively social nature, and aimed at the improvement of general social conditions. Stephens, one of the leaders, is quoted as saying "Chartism is no political movement where the main point is gaining the ballot. . . . The Charter means a good house, good food, prosperity, and shorter working hours." Immense meetings were held throughout the country, numbering sometimes upward of 100,000, and popular excitement was great. Physical force was advocated by some as the only effectual means for the masses to obtain their demands. An association called the National Convention was embodied, and commenced its sittings in Birmingham in May 1839. In June of the same year a petition in favor of the charter was presented to the House of Commons, which refused to take it into consideration. The feeling of exasperation among the Chartists increased, and in November a riot took place at Newport, in which 10 persons were killed and great numbers wounded. The year 1842 was the time of the most excitement; great riots took place in the northern and midland districts of England, and these, though not directly caused by the Chartists, were more or less connected with the movement, and the party was blamed for them. In 1848 a great demonstration took place in London, but the precautions taken by the government in enrolling special constables and making other preparations for defense frightened the leaders, and from that time Chartism rapidly declined.

Bibliography.—McCarthy, 'History of Our Own Times'; Carlyle, 'Chartism'; Gammage, 'History of the Chartist Movement'; Engels, 'Condition of the Working Class in England in 1844'; Hyndman, 'Historical Basis of Socialism in England.'

Chartran, shâr-trân, Théobald, French painter: b. Besançon 21 Jan. 1849. He studied under Cabanel, and obtained the grand prix de Rome in 1877. He has painted mostly historical pictures or portraits; among his works are 'The Body of Monseigneur Darboy lying in state in the Palace of the Archbishop of Paris'; 'Angelica and Roger'; 'Vision of Saint Francis of Assisi'; 'Capture of Rome by the Gauls'; and several portraits of which the best are those of Mounet-Sully as Hamlet, Sadi Carnot, and Leo XIII.

CHARTRES — CHASE

Chartres, shärtr, **Robert Philippe Louis Eugène Ferdinand D'Orleans**, Duc de, grandson of Louis Philippe: b. Paris 9 Nov. 1840. When only two years old he lost his father, and six years later the Revolution drove him, along with his family, into exile. The young duke was brought up in England, and joined the Union army in the first campaign of the American Civil War, in 1862. He married, 11 June 1863, Françoise Marie Amelie d'Orleans, eldest daughter of the Prince de Joinville.

Chartres, shärtr (anciently AUTRICUM, CIVITAS CARNUTUM), France, capital of the department Eure-et-Loire, 49 miles southwest of Paris, situated on the slope of a hill, at the foot of which flows the Eure, and partly enclosed by walls and ditches, surrounded by ramparts planted with trees, which form an agreeable promenade. Most of the houses are built of wood and plaster, and have their gables toward the street. The streets of the lower town are narrow and crooked, and so steep in some parts as to be inaccessible to carriages. There are several public squares, one of which is of great extent. The only public buildings of note are the cathedral, the church of St. Pierre, contiguous to a huge barrack, once a Benedictine abbey; and the obelisk to the memory of Gen. Marceau. The cathedral, one of the most magnificent in Europe, is rendered conspicuous by its two spires, one of which is 403 feet high, surmounting the hill on which the city stands. It has 130 windows filled with painted glass of admirable workmanship; and in its chair Henry IV. was crowned in 1594. Chartres is the seat of a bishopric, communal college, seminary, and agricultural society; and has two hospitals, a cabinet of natural history, botanical garden, and a public library. Toward the end of the 11th century it was fortified, and in 1145 St. Bernard preached, in its cathedral, the second crusade. Pop. (1896) 19,213.

Chartreuse, shär-tréz, the French term for a Carthusian monastery, corresponding to the Italian Certosa. The order of the Carthusians (q.v.) was not very ascetic in its rules, and each monk was allowed a decent cell and a garden of his own, so that the monasteries had often architectural character. The famous monastery called La Grande Chartreuse is the original and supreme monastery of the order, and exists in the mountains not far from Grenoble in eastern France. Of the monastic buildings still existing, none is architecturally noble, and nearly all are of date later than the middle of the 17th century. Therefore it does not rank with the great show-places of monasticism for the grandeur and splendor of its buildings, but has ever attracted travelers, curious or serious, as being the home of the most authentic exemplars of primitive monasticism in its rigor. At the Revolution the whole establishment was confiscated, the monks being driven out and secularized or banished. But in 1816 the order of Carthusians was permitted again to occupy the buildings, as tenants of the state, at a nominal rent. They were again expelled from their ancient home by the government of the French republic in 1903 under the laws for suppression of religious houses. When the monks were this time dispossessed the entire rural population of the vicinity, who had all their lives experienced the large, wise beneficence of the monks in

supporting the local hospitals, schools, churches, and the like, with their lives would have defended their benefactors against the power of the government had not the Carthusians counseled patience and forbearance. Till this second ejection from their home the monks used to derive a revenue from the sale of certain medicinal agents prepared in their laboratories which enjoyed a high reputation; in particular, the cordial liqueur Chartreuse. The other preparations were an elixir and a salve.

Chartulary, kār'tū-lā-rī, a collection of charters. When any body, ecclesiastical or secular, came to be possessed of a considerable number of charters, it has been customary for convenience and safety to have them classified and copied into a book or roll. Such book or roll has generally received the name of a Chartulary. Mabillon traces Chartularies in France as far back as the 10th century, and some authorities say that Chartularies were compiled even still earlier; but it was not till the 12th and 13th centuries that Chartularies became common. They were kept by all kinds of religious and civil corporations, but also by private families. Many of them have been printed, and their contents generally are of the greatest value in historical, archaeological, and genealogical inquiries. The name is in Scotland applied to the record of feu-charters kept by the superior's law-agent. Copies of valuable historical documents, whose originals have been lost, have been found in chartularies.

Charybdis, kā-rīb'dīs, an eddy or whirlpool in the Straits of Messina, celebrated in ancient times, and regarded as the more dangerous to navigators because in endeavoring to escape it they ran the risk of being wrecked upon Scylla, a rock opposite to it. There are several whirlpools in this region which may have been dangerous enough to the undecked boats of the Greeks, but none which the modern navigator with due caution may not easily pass. The name comes from the mythological story of Charybdis, the daughter of Poseidon and Gæa, whom Zeus, on account of her anger, hurled into the sea, where she became a whirlpool and swallowed up every ship that approached. This whirlpool is now called Calofaro and La Rema.

Chas'ca, the name under which the ancient Peruvians adored the planet Venus.

Chase, Ann, American patriot: b. Ireland 1809; d. Brooklyn 24 Dec. 1874. She came to the United States in 1818; settled in New Orleans in 1832; removed to Tampico, Mex., in the following year, where she married Franklin Chase, United States consul, in 1836. During the war with Mexico, in the absence of her husband, she remained at the consulate to protect the American records. On one occasion a mob attempted to pull down the American flag floating over the consulate, but she protected it with drawn revolver, and declared that the flag should not be touched except over her dead body. Later through her efforts the city of Tampico was taken.

Chase, F. H., English biblical scholar: b. 21 Feb. 1853. He was educated at Christ's College, Cambridge, took orders in the English Church and was successively curate of Sher-

CHASE

borne, Dorset, 1876-9, and St. Michael's, Cambridge, 1879-84. He was lecturer in theology at Pembroke College 1881-90, and at Christ's College 1893-1901, and has been principal of the Clergy Training School at Cambridge from 1887, Norrisian professor of divinity from 1901, and president of Queen's College from the last named year, also. He has published 'Chrysostom' (1887); 'The Lord's Prayer in the Early Church' (1891); 'Old Syriac Element in Codex Bezae' (1895); 'Syro-Latin Text of the Gospel' (1897); 'Credibility of the Book of Acts' (1901).

Chase, George, American lawyer: b. Portland, Me., 29 Dec. 1849. He graduated valedictorian at Yale in 1870, and at Columbia Law School in 1873. He was assistant professor of municipal law at Columbia University 1874-8; professor of criminal law, torts and procedure 1878-91; member of the university council 1890-1. In 1891 the New York Law School was chartered through his efforts, and he was chosen its dean, a position he still holds. Publications: 'The American Student's Blackstone' (1876); editor of 'Ready Legal Adviser' (1881); of Stephens' 'Digest of the Law of Evidence' (1886); 'N. Y. Code of Civil Procedure'; Chase's 'Cases on Torts.'

Chase, Philander, American Protestant Episcopal bishop: b. Cornish, N. H., 14 Dec. 1775; d. Jubilee College, Ill., 20 Sept. 1852. He graduated at Dartmouth College in 1795, and was ordained priest by Bishop Provost 10 Nov. 1799. After missionary work in New York State, and rectorships at New Orleans, La., and Hartford, Conn., he set out as a missionary in districts west of the Alleghanies. In Ohio he organized various parishes, and in 1819 was consecrated the first bishop of Ohio. Between 1821 and 1831 he was for two years president of Cincinnati College, but chiefly engaged in perfecting plans for a theological seminary. He visited England, and through the influence of Lord Gambier and Lord Kenyon raised a large sum of money, \$30,000, with which he founded the Theological Seminary and Kenyon College, at Gambier, Ohio. In 1831 he resigned his bishopric and the presidency of the college and seminary, removed to Michigan 1832, was chosen bishop of Illinois 1835; again visited England and raised \$10,000 with which he founded Jubilee College, Peoria County, Ill. Upon the death of Bishop Griswold in 1843, Bishop Chase became presiding bishop of the Church. "He was abundant in labors; indefatigable in zeal." He wrote: 'A Plea for the West' (1826); 'The Star in the West, or Kenyon College' (1828); 'Defense of Kenyon College' (1831); 'A Plea for Jubilee' (1835); 'Reminiscences: An Autobiography' (1844).

Chase, Pliny Earle, American scientist: b. Worcester, Mass., 18 Aug. 1820; d. Haverford, Pa., 17 Dec. 1886. He graduated at Harvard, 1839; taught in Philadelphia and engaged in business for many years, but employed his leisure in physical and philosophical studies. In 1864 the Magellanic gold medal of the American Philosophical Society was awarded him for his 'Numerical Relations of Gravity and Magnetism.' The results of other mathematical and physical researches were published from time to time in the 'Proceedings' of the American Philosophical Society, and brought him a wide

reputation, both in the United States and abroad, as a man of unusual scientific powers and attainments. In 1871 he became a member of the faculty of Haverford College, Pa., and for a long time was professor of philosophy and logic. He published 'Elements of Meteorology' (1884).

Chase, Salmon Portland, American jurist: b. Cornish, N. H., 13 Jan. 1808; d. New York 7 May 1873. He was the son of Ithamar Chase, a farmer, and was, on his mother's side, of Scotch descent. At the age of nine he lost his father and later came under the care of his uncle, Philander Chase (q.v.), Bishop of Ohio, attended his uncle's school and working on the farm in Worthington. In 1822 he removed with his uncle to Cincinnati, returning soon after to New Hampshire, where he entered Dartmouth College, graduating in 1826. For three years he taught school in Washington, D. C., studied law under William Wirt, and in 1830 went to Cincinnati, where he began the practice of law. He soon made his influence felt as a lecturer, as publisher of the laws of Ohio (a work which insured his standing as a lawyer even if it did not reward him financially) and as a historian. His historical work was only a sketch, but it called attention to the importance of the study of the Ordinance of 1787. In 1834 Chase was married; he had five children, most of whom died in youth. His daughter, Kate Chase Sprague, handsome, brilliant and of great force of character, is in some respects one of the most remarkable women in our history. She was, in a large sense, her father's political manager and used every effort to secure his nomination to the presidency in 1864. Neither she nor her father saw anything incongruous in this, although the latter was at the time President Lincoln's secretary of the treasury. Chase, early in his career, identified himself with the anti-slavery movement. His advice and aid as a lawyer were frequently asked and never refused, his defense of the fugitive slave, Matilda, being one of his most notable efforts in this direction. Another celebrated case was that of the Kentucky farmer, Van Zandt, the original Van Tromp in 'Uncle Tom's Cabin.' Chase appeared for the defendant in 1842, and after an appeal to the supreme court of the United States, the case was argued before that tribunal by Chase and William H. Seward. Chase was an abolitionist, not of the school of William Lloyd Garrison, but that of James G. Birney. He maintained that Congress could not rightfully place on State officials the obligation of enforcing the Fugitive Slave Law. His attitude toward slavery, by a strange combination of circumstances, made him United States senator, in 1849. In the legislature which elected Chase two Independents held the balance of power. They united with the Democrats, making the necessary 55 votes. This coalition did not compromise Chase in his subsequent career in the Senate, as his election was practically forced upon the Democrats. In the Senate he continued his opposition to slavery, during the stormy scenes of the period of compromise in 1850, and was severe in his attitude toward Clay's position.

During Chase's term of office the Republican party, composed largely of opponents of the

SAMUEL PORTLAND CHASE.

CHIEF JUSTICE OF THE UNITED STATES SUPREME COURT, 1804-1873

CHASE — CHASIDIM

Kansas-Nebraska bill, was being formed, and Chase early identified himself with it. By this party he was nominated as governor of Ohio and in 1855 was elected, and re-elected in 1857. He was still the negro's friend, and some of his acts as governor in connection with this aspect of his administration have been freely criticised. Chase was a prominent candidate for the Republican nomination for the presidency in 1860, but was destined to see the votes of his own State nominate Abraham Lincoln. He became Lincoln's secretary of the treasury, a position which he filled during the four years of the Civil War. The national banking system, practically as it exists today, is to be attributed to his influence. On four or five different occasions Chase offered his resignation, but Lincoln repeatedly declined to relieve him of his post. Upon the death of Chief Justice Taney in 1864, President Lincoln appointed Chase to the vacant office, which he filled till the time of his death. When the question arose of a presidential nomination by the Democratic party, he defined his changed attitude in the following words: "I can not approve in general what the Republican party has done. I hold my old faith in universal suffrage, in universal amnesty, and in inviolate public faith; but I do not believe in military government for American States." His position was not altogether indefensible, for he was in all essentials, except his convictions on the slavery question, a Democrat of the school of Jackson and Benton. Chase loved his friends and aided them whenever opportunity offered. His only intimate personal friend among the public men of his own age, was Charles Sumner. Chase lacked that comprehension of the common people that so strongly characterized Lincoln. His attitude toward Lincoln doubtless accounts for some of his unpopularity, but in all his public acts he was honest and sincere. See Schucker's 'Life and Public Services Salmon P. Chase' (1874).

Chase, Samuel, American jurist: b. Somerset County, Md., 17 April 1741; d. 19 June 1811. His father, a learned clergyman, instructed him in the classics; later he studied law at Annapolis, being admitted to the bar at the age of 20. Having become a member of the colonial legislature, he distinguished himself by his bold opposition to the royal governor and the court party. He took the lead in denouncing and resisting the Stamp Act, and became a most active adversary of the British government in his State. The Maryland Convention of 22 June 1774 appointed him to attend the meeting of the General Congress at Philadelphia in September of that year. He was also present and conspicuous in the subsequent Congresses during the most critical periods of the Revolutionary War. That of 1776 deputed him on a mission to Canada along with Dr. Franklin, Charles Carroll of Carrollton, and the Rev. John Carroll. He signed the Declaration of Independence without hesitation. In June 1783 the legislature of Maryland sent him to London as a commissioner to recover stock of the Bank of England, and large sums of money which belonged to the State. In 1791 he accepted the appointment of chief justice of the general court of Maryland. Five years afterward President Washington made him an associate judge of the supreme court of the

United States. Political cases of deep interest having been tried when he presided in the circuit courts, and his conduct having given much displeasure to the Democratic party, he was impeached by the national House of Representatives. The trial of the judge before the Senate is memorable on account of the excitement which it produced, the ability with which he was defended, and the nature of his acquittal. He continued to exercise his judicial functions with the highest reputation till 1811, in which year his health failed.

Chase, Thomas, American educator: b. Worcester, Mass., 16 June 1827; d. Providence, R. I., 5 Oct. 1892. He was a brother of Pliny E. Chase (q.v.). In 1855 he became professor of philology and classical literature at Haverford College, near Philadelphia; in 1875 its president. Among his publications are: 'Hellas: Her Monuments and Scenery' (1861); an address on 'Liberal Education: Its Aims and Methods.'

Chase, William Henry, American military officer: b. Massachusetts 1798; d. Pensacola, Fla., 8 Feb. 1870. He was graduated at the United States Military Academy, became first lieutenant of engineers in 1819, captain in 1825, and major in 1838. He was engaged in repairing Fort Niagara in 1817-18; as superintending engineer for many important works in 1819-28; and had charge of the defenses in Pensacola harbor, Fla., 1828-54. He superintended the improvements of Mobile Bay; as senior engineer officer had charge of all the fortifications and river and harbor improvements at the mouth of the Mississippi; and took an influential part in all projects connected with the development of the region around Pensacola. At the outbreak of the Civil War he entered the Confederate army, and was prominent in the seizure of the Pensacola navy yard.

Chase, William Merritt, American artist: b. Franklin, Ind., 1 Nov. 1849. He studied painting in oil at the National Academy in New York and subsequently in Europe with Piloty. He has made a specialty of portraits and figure pieces, winning celebrity with 'Ready for the Ride,' 'The Apprentice,' and 'The Court Jester,' and portraits of American ladies. He was appointed instructor at the Brooklyn Art School in 1881 and elected a National Academician in 1890. In 1896 he conducted an art class to Madrid.

Chasidim, *kā-sē'dim*, or **Pietists**, the name of a Jewish sect which appeared in the middle of the last century. Its adherents are strongly inclined to mysticism, depreciate the Old Testament and its ordinances, and deem themselves able to approach the Source of Light by means of a virtuous life, prayer, and secret meditation. They have a great esteem for the Haggadas of the Talmud, the books of the Cabbala, and the writings of their own teachers, which are full of tales, extraordinary cures, and mystic interpretations, but also contain excellent moral precepts. The founder of the sect was Israel of Podolia, surnamed Baalschem (contracted into Bescht), from his supposed influence with God and the spiritual hosts, whom he could move by his prayers and amulets to grant whatever he desired. At the head of the sect are three superiors or Zaddiks, each of whom has a particular diocese or district allotted to

CHASING — CHASSEPOT RIFLE

him, and jurisdiction over all the Chasideans resident within it. They are most numerous in Russian Poland, Moldavia, Wallachia, and some parts of Galicia and Hungary, and are regarded with great antipathy by the orthodox Jews. Chasidim is also the name given to a sect which sprang up about the second century B.C. This party is credited with the origin of the revolt of the Maccabees, with combating the erroneous notions bred among the Jews by the study of Grecian philosophy, and with being the parent stock of the Pharisees. See JEWISH SECTS.

Chasing, the art of cutting artistic or ornamental designs on metals. Figures on metal are often produced in relief by being punched out from behind, and sculptured or finished on the front with small chisels and gravers. It is this latter process that is properly called chasing, and the same term is applied to designs produced by hand-tools on more or less flat surfaces.

Chasles, Michel, mē-shēl shāl, French engineer: b. near Chartres 15 Nov. 1793; d. Paris 18 Dec. 1880. He entered the École Polytechnique in 1812, and on leaving was classed among the engineers; but with rare generosity he renounced his place as an officer in order to assure a career to one of his unsuccessful comrades. In December 1820 he addressed to the Brussels Academy a memoir on two general principles of geometry, duality and homography. The introduction to this memoir expanded into the well-known 'Historical View of the Origin and Development of Method in Geometry,' the first edition of which was published in 1837. In 1841 he was appointed to the chair of Machines and Geodesy at the École Polytechnique, and in 1846 to that of Higher Geometry, which had just been instituted at the Sorbonne. Some of his published works are: 'Treatise on Higher Geometry' (1852); 'The Three Books of Euclid's Porisms Re-established for the First Time' (1860); 'Treatise on Conic Sections' (1865); 'Reports on the Progress of Geometry' (1870). These, his principal works, are geometrical and historical. His contributions to the 'Comptes Rendus' of the Academy of Sciences and to other scientific publications are extremely numerous, and though in the main geometrical, are not exclusively so. In particular he treated in several memoirs the question of attraction, and gave the first synthetic demonstration of a celebrated theorem of Maclaurin on the attraction of ellipsoids. Two of his memoirs on the properties of cones of the second degree, and on the spherical conics, were translated into English, and published, with additions, by Charles Graves in 1841. During his long life he was the recipient of many scientific distinctions, and he will always be cited as one of the great geometers of the present century.

Chasles, Victor Euphémion Philarete, French critic: b. Mainvilliers, near Chartres, 8 Oct. 1798; d. Venice, 18 July 1873. The son of a Jacobin, and educated according to Rousseau, he acquired the point of view which, enlarged by life abroad, makes his essays so unique and instructive. He has written in every imaginable prose form, from a romance to a riddle; but his enduring work is contained in 'French Language and Literature from the Beginning of the Sixteenth Century to 1610' (1828);

'Studies of Antiquity' (1847); 'Studies of the Sixteenth Century in France' (1848); 'Journeys of a Critic Through Life and Books' (2d series, 2d ed., 1866-8); and 'Memoirs' (1876-8).

Chassaignac, shā-sān-yāk, Charles Louis, American physician: b. New Orleans, 5 Jan. 1862. He was graduated at the medical department of the University of Louisiana; and was president and Professor of Genito-Urinary Diseases at the New Orleans Polyclinic in 1902. He was editor of the 'New Orleans Medical and Surgical Journal'; president of the Orleans Parish Medical Society; vice-president of the Louisiana State Medical Society; one of the founders and president of the New Orleans Sanitarium and Training School for Nurses; etc.

Chassé, shā-sā', David Hendrik, BARON, Dutch soldier: b. Thiel in Guelders 18 March 1765; d. Breda 2 May 1849. He began his military career when but 10 years of age; became lieutenant in 1781, and captain in 1787. After the failure of the revolutionary movement he took French service; was appointed lieutenant-colonel in 1793; and two years later found himself marching toward the Netherlands under the command of Pichegru. He afterward fought with the French in Germany and Spain, gaining great distinction, and from Napoleon himself, because of his fondness for bayonet charges, the name of "Général Baïonette." He was made a baron by Louis Bonaparte in 1809. As lieutenant-general of the Dutch forces, in 1815, Chassé did good service at Waterloo against his old comrades, the French. As governor of Antwerp he covered himself with glory by his heroic three-weeks' defense of the citadel with 5,000 men against 60,000 Belgians and French (1832).

Chassepôt, Antoine Alphonse, ān twān āl-fōns shas-pō, French inventor: b. 4 March 1833. He was an employee in the Paris arsenal of St. Thomas, where he became an official in 1858, and in 1863 brought before the government the model of his breech-loading rifle, adopted three years afterward, and subsequently abandoned. It was about four pounds lighter than the needle-gun and about one pound lighter than the Martini-Henry rifle.

Chassepot (shās-pō) Rifle, a breech-loading rifle, named after its inventor, and adopted as the firearm of the French infantry in 1866, after the value of the Prussian needle-gun had been shown in the war between Prussia and Austria. It is not now in use, having been replaced in the French army by a much modified form of small-arms. It belonged to the same system as the needle-gun, but was believed to have sundry advantages over that weapon. It was considerably lighter than the needle-gun, the weight of the latter being 12 pounds, and that of the former less than nine pounds. In accuracy, penetrative power, length of range, lowness of trajectory, and rapidity of fire, it was inferior to the Martini-Henry. To the needle-gun it was superior in length of range and lowness of trajectory, as was shown in the war of 1870, in which the French could open fire at the distance of 1,500 paces, while the effective range of the needle-gun was only 400 to 500 paces. This superiority, however, was neutralized by the fact that its lightness and

its large charge had the effect of producing great recoil and of heating the barrel. At the commencement of an action the men would open fire at long ranges, but before closing with the enemy the barrel of their piece was so heated that the weapon could hardly be handled. From the recoil and heating combined, the soldier was obliged to fire from the hip, so that his aim was not accurate; while after much firing the breech became clogged.

Chasseur, shā-sēr, a male attendant upon persons of distinction, attired in a military dress, and wearing a sword. It is also the name given by the French to bodies of light infantry which act as skirmishers and sharpshooters. The name was originally given to some troops raised in 1815, in imitation of the Jagers of the Austrian army, who were chiefly Tyrolese chamois-hunters, and unerring marksmen. The French Chasseurs are of two kinds, light cavalry and infantry. Every battalion of infantry has a company of Chasseurs, but the term is more particularly applied to that body of men called the Chasseurs de Vincennes, who were enrolled and armed with rifles in 1833, and quartered at Vincennes. The Chasseurs of the Italian army are called Bersaglieri. Garibaldi's Chasseurs, that took a prominent part in the Italian war of 1859, and in the campaign against Francis II. of Naples, in 1860, were known as Cacciatori dei Alpi, or Alpine hunters.

Chastelard, Pierre de Boscobel de, pē ār de bōs'kōbēl shat-lar, French poet: b. Dauphiné 1540; d. 1563. He fell madly in love with Mary Stuart at the French court, and poured forth his admiration in innumerable poems. He figures as one of her escort on her return to Scotland after the death of her husband (1561). He had to return to France after this pleasing duty was performed, but on the first opportunity he was again in Scotland (1562). Mary gave him a very gracious welcome, answered, it is said, a poem dedicated to her, and allowed him to accompany her singing with his flute. Chastelard had the temerity one night to invade the royal bed-chamber. He was discovered, and ordered by the queen to quit the kingdom. Shortly after, however, he again concealed himself in a recess in her bedroom at Burntisland. For this offense he was tried publicly at St. Andrews and forthwith hanged, the queen resisting all appeals for pardon.

Chastelard, a tragedy published in 1869, by Algernon Charles Swinburne, the scene of which is laid at Holyrood Castle, during the reign of Mary Queen of Scots. The tragedy is conspicuously one to be read, not acted. It is too long, too much lacking in action, and of too sustained an intensity, for the stage. The style is essentially lyric, full of exquisite lines and phrases; and as a whole, the play presents an intense passion in a form of adequate beauty.

Chasteler, shāt-lā, **Jean Gabriel**, MARQUIS OF: b. 1763; d. Venice 7 May 1825. He was grandee of Spain of the first rank, Austrian master of ordnance or general of artillery, military governor of Venice, and descended in a collateral line from the dukes of Lorraine. He received his first educa-

tion at Metz in the Collège de Fort. In 1776 he entered the Austrian service. After having served against the Turks, by whom he was severely wounded, he displayed his zeal for the house of Austria in the disturbances in the Netherlands. In 1796-7 he was employed in the negotiations of his court in Poland and Russia; was afterward with Suwaroff in Italy, where he distinguished himself in several engagements with the French armies. In 1808, with Hormayr, he was the soul of the famous insurrection in the Tyrol, and all the political as well as military events which were connected with it. Napoleon, enraged at the surrender of 8,000 French and Bavarians at Innsbruck, issued a proclamation at Enns, in which "a certain Chasteler who calls himself a general in the Austrian service, but who is the leader of a band of robbers, and the author of the murders committed upon the French and Bavarian prisoners, as well as the instigator of the Tyrolese insurrection," is declared an outlaw, and ordered to be brought before a court-martial and shot within 24 hours. The Emperor Francis commanded that an order which violated all international laws, and which was the more censurable as Chasteler had taken particular care of the prisoners and the wounded, should be met by retaliation. The Bavarian army, under the command of the marshal-duke of Danzig, entered Tyrol. Chasteler fearlessly encountered it, but his army was routed 13 May. After the close of the war he received several appointments, and in December 1814 was made governor of Venice.

Chastelet, shāt lā, **Gabrielle Emilie Breteuil**, bre-te-yēi, MARQUISE DU: b. Picardy 1706; d. Lunéville 1749. She was of an ancient family, was taught Latin by her father, Baron Breteuil, and was well acquainted with that language, but her favorite study was mathematics. She had a sound judgment and much taste, loved society and the amusements of her age and sex, but after the publication of the 'Philosophical Letters' by Voltaire had roused the Jesuits' criticism against him, she abandoned all these pleasures, and in 1733 retired with him to the dilapidated castle of Cirey, situated in a dreary region on the borders of Champagne and Lorraine. She embellished this residence, formed a library, collected instruments, etc. Cirey was often visited by the learned,—by Maupertuis, John Bernoulli, etc. Here the marchioness learned English of Voltaire in the space of three months, and read with him Newton, Locke, and Pope. She also wrote an analysis of the system of Leibnitz, and translated Newton's 'Principia' with an algebraic commentary. Voltaire lived six years with her at Cirey, where they employed their time in the study of science, and in getting up lovers' quarrels for the pleasure of patching them up again. At the end of this time she went to Brussels to prosecute a lawsuit, which was terminated by an advantageous compromise, brought about by Voltaire. She also carried on a correspondence with the German philosopher, Wolf, until her death. Her 'Traité de la Nature du Feu' obtained the prize of the Parisian Academy of Sciences, and is published in their collections. Her husband, the Marquis du Chastelet Lomont, was high-steward of King Stanislaus Lesczinsky at Lunéville.

CHASTELLUX — CHATEAUBRIAND

Chastellux, François Jean, frān swā zhōn shāt lüks, **Chevalier de**, French historian: b. Paris 1734; d. Paris 28 Oct. 1788. He entered the army in 1749; distinguished himself as colonel in the Seven years' war, and later served in the American Revolution as major-general under Rochambeau, and gained the friendship of Washington by his amiable character. He published numerous works relating to the United States, including 'Voyage dans l'Amerique septentrionale dans les annees, 1780-1782'; 'Discours sur les avantages et les disadvantages qui resultent pour l'Europe de la decouverte de l'Amerique'; and translated into French David Humphry's 'Address to the Army of the United States.'

Chasuble, chās'ū-bl, the outermost vestment worn by a priest in celebrating the mass: its name in Latin is *casula*, dim. of *casa*, house. In its original form it was a garment of circular or elliptical form like the South American *poncho*, with an opening in its centre through which the head of the wearer passes. But the form of chasuble now employed almost universally consists of a more or less oval front and back joined at the top, where is an opening to allow the head to pass through. The garment is usually of silk embroidered and decorated with gold or silver thread, and with a cross on the back. Chasubles of different colors, white (or cloth of gold) red, violet, green, black, are worn according to the occasion; as white on all high festivals, violet in penitential times, red on the anniversaries of martyrs, black in masses for the dead, etc. In the present form of the chasuble the priest's arms are free, whereas in the ancient form, the garment covered the person like a cloak.

Chat, a name given to various small passerine birds, chiefly of the genera *Saxicola* and *Icteria*; generally used with a prefix. The yellow-breasted chat (*Icteria virens*, with the western variety *longicauda*) is an aberrant member of the family of wood-warblers (*Mniotiltidae*), from the typical members of which it differs in its large size, robust build and stout bill. The sexes are similarly colored, being bright olive-green above, brilliant yellow on the breast and white on the belly, the sides of the head black with white markings. It is an abundant bird in thickets in the United States as far north as the latitude of Massachusetts, is migratory, and chiefly remarkable for its exceeding volubility and the incongruous admixture of sounds, natural and mimicked, of which its song consists. During the mating season the males indulge in the most extravagant aerial antics while singing, and often sing at night. See **STONE-CHAT**.

Chatard, shā-tār, **Francis Silas Mareau**, American Roman Catholic prelate: b. Baltimore 1834. He was graduated at Mount Saint Mary's and at Saint Urban College, Rome, being ordained to the priesthood in 1863. He became rector of the American College in Rome and in 1878 bishop of Vincennes. He has written 'Christian Truths.'

Château-Gaillard, gī-yār, a feudal fortress in France, near Les Andelys (Eure), built by Richard Cœur de Lion in 1197. As late as the 15th century it was considered one of the strongest fortresses in Normandy. Its picturesque situation on a high cliff 300 feet above the Seine

has made it a favorite subject for artists. Turner has represented it in two of his pictures. See **ANDELYS, LES**.

Chateau-Gontier, shā tō gōn-tē-ā, France, a town in the department of Mayenne, 19 miles south-southeast of Laval, on the Mayenne, here crossed by a stone bridge, connecting the town with its principal suburb on the opposite side. Its houses are well built, but the streets are irregularly laid out. It has a court of first resort, an agricultural society, and communal college; and linen and serge manufactories, bleachfields, tanneries; with some trade in clover seed, linen, thread, iron, wood, wine, etc. Pop. (1896) 7,227.

Chateau-Lafitte, là-fēt, **Chateau Latour**, and **Chateau Margaux**, famous vineyards, all in the department of the Gironde, France, furnishing the best of the red wines of Bordeaux. See **BORDEAUX WINES**.

Château-Thierry, tē-ār-rē, France, a town in the department of Aisne, on the right bank of the Marne, 38 miles south-southwest of Laon. It occupies the side of a hill, whose rocky summit is crowned by the ruins of the old castle of Thierry, said to have been built by Charles Martel, in 730. It is the birthplace of La Fontaine (to whom a fine marble statue has been erected), and was the scene of several conflicts during the campaign of 1814. On 9 Sept. 1870, it was occupied by the Germans, and became a few days later the temporary headquarters of the emperor. It possesses a court of primary resort and a communal college, and has manufactures of linen and cotton twist, and a trade in grain, wool, and cattle. Pop. (1891) 6,863.

Châteaubriand, François Auguste, frān swā ô-gust sha-tō-brē-ān, **VICOMTE DE**, French author and politician: b. St. Malo, Brittany, 4 Sept. 1768; d. Paris 4 July 1848. He received a commission in the army in 1788, and at the commencement of the Revolution he hurried into Paris to witness the great commotions then taking place there. In the spring of 1791 his ardent and enthusiastic spirit led him to join an expedition to America for the purpose of exploring its Arctic regions, and discovering the north-west passage. He crossed the Atlantic, landed at Baltimore, and proceeded to Philadelphia, where he had an interview with Washington. Returning to France in 1792 and married. Out of his American experience largely grew his 'Les Natchez' (see **NATCHEZ, LES**). He returned shortly after he quitted France and joined with other emigrants the Prussian army on the Rhine. At the siege of Thionville he was wounded in the thigh, and subsequently became an exile in England. Here his health gave way, and friendless and penniless he continued for a time to wear out a miserable existence in London. He at last found means of earning a subsistence by giving lessons in French and executing translations for the booksellers. In 1797 he published his 'Essai historique, politique et moral sur les Révolutions anciennes et modernes, considérées dans leurs Rapports avec la Révolution Française.' It was not intended with much success in England, and attracted no notice whatever in France. The essay is pervaded by a strong sceptical spirit in religious matters, but its author's views on this subject were soon to

CHATEAUDUN — CHATEAUGUAY RIVER

experience a sudden and important change. The death of his mother in prison, and the accounts of her last moments transmitted to him by his sister, who herself was no more by the time her letter reached her brother, made a lasting impression on the mind of Châteaubriand, and he became a firm believer in Christianity. In 1800 he ventured to return to France and take up his abode under an assumed name at Paris. Encouraged by the success of an essay on literature, contributed to the 'Mercure,' he published in 1801 his 'Atala,' which was afterward introduced as an episode into his 'Génie du Christianisme.' In the following year appeared his celebrated work 'Le Génie du Christianisme,' which may be said to have caused a religious reaction, and inaugurated a new period in the social history of France. The object of Châteaubriand was to demonstrate the superiority of Christianity over all other religions in a poetic and artistic, as well as moral and beneficial point of view. Though a work more brilliant than profound, it is unsurpassed for beauty of language and description and the eloquence of its impassioned appeals. The main charm indeed of the book may be said to lie in its beautiful imagery, drawn from external nature, and more especially from nature as exemplified in the glowing scenery of the New World. In this respect Châteaubriand may be said to have revived in French literature the description of natural scenery and objects which had long been almost unknown. His work attracted the attention and admiration of Bonaparte, and in 1803 he was appointed French minister for the Republic of the Valais. This office he resigned in 1804.

In order to give life and tangible form to the theories propounded in the 'Génie du Christianisme,' he commenced 'Les Martyrs,' and to qualify himself for describing accurately the scenes amid which the poem is laid, made a pilgrimage to the East. In 1809 'Les Martyrs' was published, and is considered by many the best of his works. Some of the descriptions, such as the ancient forests of Gaul, the assemblies of the Christians in the catacombs, and the picture of Rome under the emperors, are given with marvelous beauty and effect. In 1811 appeared his 'Itinéraire de Paris à Jérusalem.' The restoration of Louis XVIII. was hailed by him with enthusiasm, and a pamphlet entitled 'De Bonaparte et des Bourbons,' published by him in 1814, was said by the king to have been worth to him an army of 100,000 men. On the second restoration he preserved the title of minister of state, but refused to take office along with Fouché. On the accession of Villèle to power Châteaubriand was appointed ambassador to Berlin, then to London, and in September 1822, crossed the Alps to represent France at the congress of Verona. In 1824 he was summarily dismissed from office at the instance of Villèle, and the indignation which he felt at such treatment made him join the ranks of the opposition, where in the columns of the 'Journal des Débats' he fulminated attacks against government. On the accession of the Martignac ministry he again returned to office, and proceeded as ambassador to Rome, but resigned this appointment on Polignac becoming premier. On the revolution of 1830 he refused to take the oath of allegiance to Louis Philippe, and con-

sequently forfeited his seat in the house of peers and a pension of 12,000 francs. In 1831 a new work appeared from his pen, entitled 'De la Restauration, et de la Monarchie élective,' in which occurs the following singular avowal: "I am a Bourbonist by honor, a royalist by reason and conviction, and a Republican by inclination and character." In the same year he published his 'Études ou Discours historiques sur la Chute de l'Empire Romain,' a work exhibiting more of the imagination of the poet than the critical acumen of the historian. Owing to several pamphlets of a legitimist tendency issued by him, he was arrested in 1832, but defended by M. Berryer, and acquitted. In the latter years of his life he published an 'Essay on English Literature,' a literal prose translation of 'Milton's Paradise Lost,' and other works. His memoirs appeared after his death, under the title of 'Mémoires d'outre Tombe.' They possess a great interest, and contain many charming passages, but are at times disfigured by the ebullitions of personal vanity, which formed one of the principal weaknesses of Châteaubriand. He was an intimate friend of the celebrated Madame Récamier, whose feeling toward him amounted almost to worship, and up to his last days he reigned supreme in her salon of the Abbaye-au-Bois, where all that was illustrious then came together.

Châteaudun, shä tō deñ, France, a town in the department of Eure-et-Loire, 26 miles south-southwest of Chartres, near the right bank of the Loire. Its streets are straight and terminate in a square, from which a complete view of the town may be obtained. The hôtel de ville and college buildings are deserving of notice. The old castle of the counts of Dunois overlooks the town. Châteaudun has manufactures of blankets, and large tanneries, and some trade in agricultural produce. In the Franco-German war the town was captured by the Germans (18 Oct. 1870), who held it till 9 November, when they were driven out by the French; it was, however, recaptured some few days after. Pop. (1891) 7,147.

Chateauguay (shät-ō-gä') **River**, Lower Canada: operations on in the War of 1812; and battle of 25 Oct. 1813. (For the previous operations in the campaign against Montreal, see CHRYSLER'S FARM.) Gen. Wade Hampton had been for some months in command at Burlington, Vt., when Wilkinson ordered him to advance on Montreal; ostensibly to co-operate with himself, though he had not yet started down the St. Lawrence. Hampton moved to the Canada line; then, finding that a drought had impaired the water supply on the straight road, marched westward to Chateauguay, N. Y., some 50 miles from the mouth of the Chateauguay River, an affluent of the St. Lawrence. He remained there three weeks, menacing the British communications and opening up his own, building roads, getting up supplies and artillery, etc. On 16 October Armstrong ordered him to approach the river-mouth for convenient junction with Wilkinson; and on the 22d-24th he established himself at Spear's, about 15 miles from the mouth. He had some 4,000 raw troops and 200 dragoons. Prevost had about 15,000 around Montreal, and the river lined with gunboats and batteries, while Hampton had not even

CHATEAUNEUF DE RANDON — CHATELET

transports, and was in the heart of a hostile country. Prevost could have captured his whole army without much trouble; but he was really alarmed that Hampton was excellently posted to threaten the communications and supplies on the river. When Hampton advanced to Spear's, the British militia there retired; but Lieut.-Col. de Salaberry with 800 regulars intrenched himself in front on the road to the St. Lawrence, and filled the road with abattis. Hampton felt it needful to restore his communication with the river, and on the night of the 25th sent a strong flanking party around, while he himself attacked Salaberry in front. The former lost his way, and on this account he did not press his own attack. He lost 50 men, the British 25. Just then he received a message to prepare winter quarters; and feeling sure the campaign was to be abandoned, fell slowly back to Chateauguay, unmolested by Prevost. A week later he received a request from Wilkinson to send supplies forward and march down the river: he replied that he had none to send, and as Wilkinson evidently had not enough to sustain a forward movement, he should fall back to Plattsburg. Wilkinson received the message the day after his defeat at Chrystler's, and at once went into winter quarters.

Chateaneuf de Randon, shā-tō-néf-dē-rān-dōn, France, a small town in the department of Lozère, 12 miles northeast of Mende, on a hill. It was formerly fortified, and is celebrated for the four years' siege sustained by the English garrison in 1380, against the troops of Charles V., commanded by the chivalrous Duguesclin. During this siege the English governor, who had been hard pressed, promised to surrender to Duguesclin at the expiration of 15 days, if no succor arrived. Before the end of the time agreed upon Duguesclin died, when his successor summoned the governor, who replied that he had given his word to Duguesclin, and would yield to no other. Informed of the hero's death, he said, "Then I will carry the keys to his tomb." Accordingly the governor sallied forth with the garrison to Duguesclin's tent, and on his bended knees laid his sword and the keys of the town on the bier. In 1820 a simple commemorative monument was erected at the hamlet of Bitareille, on the spot where this event occurred. Pop. 3,541.

Châteauroux, shā-tō-roo, France, capital of the department of Indre, 144 miles southwest of Paris, in an extensive plain, left bank of the Indre. It has straight, broad, and tolerably well-paved streets, and spacious squares, with a public garden, and some fine promenades. The cloth manufactures, in which the wools of Berry are almost exclusively used, are extensive, employing about 2,000 workmen. Cotton hosiery, woolen yarn, tiles, paper, and parchment are also made; and there are tanneries and dyeworks. There is likewise a considerable trade in grain, wine, iron, wool, poultry, and cattle. The town owes its origin to a castle built in 950 by Raoul le Large, of Déols, still in a tolerable state of preservation. It was considerably extended in the reign of Louis XIII., who constituted it a duchy in favor of the descendants of Henry II. of Bourbon, prince of Condé. Charles of Bourbon sold it to Louis XV., who conferred it on one

of his mistresses, at whose death it returned to the crown. During the revolution of 1793 it was called Indreville. Pop. (1896) 23,863.

Chatelain, shā-tē-lān. See CASTELLAN.

Chatelard, shā-tē-lār. See CHATELARD.

Châtelet, shā-tē-lā, Belgium, a manufacturing town in the province of Hainaut, on the Sambre, five miles east of Charleroi. Its chief industries are the manufacture of cotton-stuffs, knives, nails, and pottery. Pop. (1897) 11,255. Châtelineau, opposite to it, has a pop. of (1897) 11,519.

Châtelet was anciently a small chateau or fortress, and the officer who commanded it was called *châtelain*. The word is a diminutive of *château*, formed from *castellum*, a diminutive of *castrum*; or from *castellatum*, a diminutive of *castellum*, castle. The term, in later times, has been applied to certain courts of justice, established in several cities in France. The Grand Châtelet, in Paris, was the place where the presidial or ordinary court of justice of the prévôt of Paris was kept, consisting of a presidial, a civil chamber, a criminal chamber, and a chamber of police. The term signified the same at Montpellier, Orleans, etc. When Paris was confined to the limits of the old city (*citée*), it could be entered only by two bridges (Le Petit Pont and Le Pont au Change), each of which was fortified with two towers—a smaller one in the wall, facing the city, and a larger one before the bridge, toward the country. These two exterior turrets were the Grand and Petit Châtelet. The tradition that the Grand Châtelet was built by Julius Cæsar, though adopted by some, is not well supported; but it is certain that the great tower was standing as early as the siege of the city by the Normans (885). The Grand Châtelet was the castle of the counts of Paris, and therefore the seat of all the royal courts of justice within the city and county, and also of the feudal court. The city had no proper jurisdiction whatever; its bailiff or provost (*prévôt*) was appointed by the king, and was president of the court (though only nominally, because he had no voice in the judgments), and, by virtue of his office, leader of the nobility. The office of provost of the merchants (*prévôt des marchands*; in other cities *maire*), established before the former, and afterward united with it for a time, was finally separated from it in 1388. The business of the Châtelet was transacted by the deputies of the bailiff (*licutenants*), of whom there were five, three for civil causes, one chief judge of criminal cases, and a lieutenant-general of police (*lieutenant-général de la police*). The latter, indeed, was minister of police for the whole kingdom, and at the extent of his functions and power, particularly after the new arrangement made by the celebrated d'Argenson under Louis XIV., rendered him one of the most important officers of the state. In the Châtelet, however, he held only the fourth place. The whole court of justice was composed of 57 counselors, with 13 state attorneys, and a multitude of subalterns, as 63 secretaries or *greffiers*, 113 notaries, 235 attorneys, etc. All these offices were sold. The place of the first officer of the civil chamber was rated at 500,000 livres; that of a notary at 40,000 livres. The Châtelet was first in rank after the supreme courts (*cours souveraines*).

CHATELLERAULT — CHATHAM

Châtellerault, shă-těl-lê-rô, France, in the department Vienne, 20 miles north-northeast of Poitiers. It stands on the right bank of the Vienne, which here becomes navigable, and is a place of some antiquity, having once been the capital of a duchy which, in 1548, was bestowed by Henry II. on the Earl of Arran, regent of Scotland, and still gives a title to his descendant, the Duke of Hamilton. The old walls and fortifications of the town have been removed and the site converted into promenades. There are here manufactures of cutlery, hardware, jewelry, lace, etc., and a good trade. Pop. (1896) 20,014.

Chatfield-Taylor, Hobart Chatfield, American novelist: b. Chicago, Ill., 25 March 1865. He was graduated at Cornell University in 1886, and has written: 'With Edge Tools' (1891); 'An American Peeress' (1893); 'Two Women and a Fool' (1895); 'The Land of the Castanet' (1896); 'The Vice of Fools' (1898); 'The Idle Born' (1900).

Chatham, chăt-âm. **William Pitt, EARL OF**, English statesman: b. Westminster 15 Nov. 1708; d. Hayes, Kent, 11 May 1778. He was educated at Eton and Oxford. On quitting the university he became a cornet in the blues, and in 1735 represented the borough of Old Sarum (the property of his family) in the House of Commons, where he attracted universal notice. He was a powerful opponent of Sir Robert Walpole, who revenged himself by taking away his commission. In January 1747, he delivered the speech reported by Johnson for the 'Gentleman's Magazine,' beginning, "The atrocious crime of being a young man, which the honorable gentleman has with such spirit and decency charged upon me, I shall neither attempt to palliate nor deny." But it is probable that there is more of Johnson than of Pitt in it. In 1744 he received, on account of his patriotism, a legacy of £10,000 from the Duchess of Marlborough; became in 1746 vice-treasurer of Ireland, paymaster-general of the army, and member of the privy council. In 1755 he resigned the paymaster's office. In 1756 he was appointed secretary of state, but was dismissed the same year on account of his opposition to the Hanoverian policy of George II. The nation, however, was enthusiastically attached to him, and the public discontent was so loudly manifested, that he was appointed secretary of state again in 1757. His great mind now revealed its full force. His ascendancy was complete over the Parliament no less than in the ministry; he aroused the English nation to new activity. In 1760 he advised the declaration of war against Spain while she was unprepared for resistance, as he foresaw that she would assist France. The elevation of England on the ruins of the house of Bourbon was the great object of his policy. But his plans were suddenly interrupted by the death of George II. George III. was prejudiced against Pitt by his adversary, the Earl of Bute, a statesman of limited views. Pitt therefore resigned his post in 1761, only retaining his seat in the House of Commons. On his retirement his wife was created Baroness Chatham. In 1762, when Spain formally allied herself with France, Pitt urged the continuance of the war, by which both states would perhaps have been totally exhausted; but peace was concluded by the opposite party in

1763. Pitt uniformly supported the cause of the people. Foreseeing the separation of the American colonies from the mother country, if the arbitrary measures then adopted should be continued, he advocated, especially in 1766, a conciliatory policy, and the repeal of the Stamp Act. In the same year he was invited to assist in forming a new ministry, in which he took the office of privy-seal, and was created Viscount Burton, Baron Pensent, and Earl of Chatham. In 1768 he resigned, but in the House of Lords continued to recommend the abandonment of the coercive measures employed against America, particularly in 1774. His warning was rejected, and in 1776 the colonies declared themselves independent. In vain did he renew his motion for reconciliation in 1777; in vain did he declare the conquest of America impossible. On 7 April 1778, though laboring under a severe illness, he repaired to the House, to attack the unjust and impolitic proceedings of the ministers toward the colonies. At the close of his speech he fainted and fell backward; he was conveyed out of the House, and afterward removed to his country-seat at Hayes, in Kent, where he died a month later. The Parliament annexed an annuity of £4,000 to the earldom of Chatham, his debts were paid, and he was honored with a public funeral, and a magnificent monument in Westminster Abbey. Another was erected in 1782 in Guildhall. His popularity in America was very great and several localities were named Chatham in his honor, as well as Pittsburg, Pa., and Pittsfield, Mass.

Chatham, New Brunswick, Canada, at the mouth of the Miramichi, and on its right bank, 98 miles northeast of Fredericton. It has a good harbor, is an important port of entry, has a Roman Catholic cathedral and college, and a large trade in lumber. Pop. (1891) 5,644.

Chatham, chăt'am, Ontario, Canada, city on the Thames, 11 miles north of Lake Erie, with manufactures of machinery, woollens, soap, and candle works. It is a trade centre, with good facilities for shipping the products of the surrounding country, and has a trade in lumber. Pop. (1901) 9,052.

Chatham, England, now a parliamentary and municipal borough, naval arsenal, and seaport, in county Kent, on the Medway, about 33 miles by rail from London, practically forming one town with Rochester. As a parliamentary borough it includes Gillingham and New Brompton, and returns one member. Until a recent period a great portion of the town was irregular and ill-built, but recently considerable improvements have been carried out, and are still in course of progress. The great features of Chatham are the naval and military establishments here or in the immediate vicinity. The dockyard was founded by Queen Elizabeth previous to the period of the Armada, and during this reign Upnor Castle, on the left bank of the Medway, was erected to protect the dock and shipping. Despite the fire from the castle, however, in 1667, Van Ghent, a vice-admiral of De Ruyter's, succeeded in breaking the chain stretched across the river, burned and sunk several ships, and retired bearing off the warship, the Royal Charles, as a prize. Subsequently the fortifications were greatly strengthened and enlarged, but the great increase in the power of

CHATHAM ISLAND — CHATSWORTH

modern ordnance having rendered parts of the works of little value, a number of out-lying forts have had to be built. With its modern extensions the royal dockyard now extends for about two miles along the river, and is most thoroughly equipped for the building, fitting out, and repairing of war vessels. Among recent additions are three basins for iron-clad warships, with a total area of about 75 acres. One of these, the repairing basin, has an area of 22 acres, and is connected with four dry-docks. It has 3,500 feet of wharfage, is 80 feet wide at the entrance and about 30-32 feet deep at high water. The largest, or fitting-out basin, has a water area of 33 acres, with 5,800 feet of wharfage, and a depth of 30 feet. From it the heaviest war-ships fully equipped are able to proceed direct to sea. The factory basin (20 acres area) is intended for fitting vessels with their engines, etc. The engine factories and machine works on the south side of this basin are about 2,500 feet long, and occupy about 14 acres. The cost of these works was nearly \$15,000,000. The largest class of iron-clads are built here. There are several covered slips for building ships upon, the iron roofs of some costing \$50,000. The rope-house has a length of 1,200 feet; there are great saw-mills, and the forges turn out armor plates, anchors, and other articles required for the battle-ships of the present day. In short, all the requisites of a great naval station are here on the most complete scale. The military establishments include extensive infantry barracks, and barracks for the royal marines; the headquarters of the royal engineers, arsenal and park of artillery, hospitals, etc. The whole is surrounded by a very extensive system of fortified works, rendering Chatham a place of great strength. The old convict prison has been partly pulled down and replaced by naval barracks. The fortifications are regarded as a defense for London, a protection against an invasion from the south coast. Chatham is one of the chief ship-building towns of England; but the people do not forget the noted dead of the nation. A statue to Lord Waghorn reminds them of his work on the "overland route" to India, and a monument to Gordon represents him as an explorer. Charles Dickens lived some time in Ordnance Place, Chatham. Pop. (1901) 78,746. of the parliamentary borough.

Chatham Island, the most important of the Galapagos archipelago (q.v.); 600 miles from Ecuador, which owns the group, and uses Chatham, Charles, and Albemarle as penal settlements for political offenders. Its interest to Americans lies in the negotiations opened with Ecuador in March 1900, to buy it for a Pacific coaling station.

Chatham Islands, in south Pacific Ocean, belong to New Zealand. The group, three in number, are in lat. 44° 7' S.; lon. about 176° 49' E. The group is of volcanic origin. Chatham, the largest island, is about 38 miles long and 25 broad. The other islands are Pitt Island, 12 miles long by 8 broad; and Ranga Tira, a mere rock. The harbor of Waitangi, on the west side of Chatham Island, is much frequented by whaling vessels, which there supply themselves with fuel, provisions, and water. There are few hills in the island, and the highest does not exceed

800 feet. In the interior of the largest island is a brackish lake. The soil is in many places fertile, and crops of potatoes and wheat have been successfully and extensively cultivated and exported. Turnips, cabbages, pumpkins, and tobacco are also successfully cultivated. The creeks and shores abound in fish, many of them excellent; sharks of formidable size are numerous. Stock raising and seal fishing are prominent industries. The original inhabitants, now nearly extinct, are a cheerful and good-natured race. About the year 1830 they amounted to some 1,200, but they now number little more than 30. The destruction of this unfortunate people is attributed to the cruelty and tyranny of the New Zealanders, a number of whom migrated to the island in 1836, and by the superior energy and ferocity of their character soon became masters of the inoffensive aborigines. The present population amounts to about 400, more than half of whom are Maoris. The Chatham Islands were discovered by Lieut. William Robert Broughton, of H.M. brig Chatham, and taken possession of by that officer in name of his Britannic majesty, 29 Nov. 1791.

Chati, chā-tē, a wildcat (*Felis mitis*) ranging from Mexico to Paraguay, in warm lowlands and woods. The body, including the head, is from 24 to 27 inches long, the tail about 14 to 18 inches. The fur is soft and tawny, spotted with black. This cat is by some naturalists considered a variety of the margay (q.v.).

Chatillon - sur - Seine, sha-tē-yōn-sur-sân, France, department of Côte d'Or, 45 miles northwest of Dijon, on the Seine. Pop. (1896) 5,000.

Chat'moss, an extensive morass, area about 6,000 to 7,000 acres, situated chiefly in the parish of Eccles, Lancashire, England. It is remarkable as being the scene of operations for reclaiming bog-land, first successfully carried out on a large scale in the end of the 18th and beginning of the 19th century; also for offering one more field of triumph to George Stephenson, who carried the Liverpool & Manchester Railway over it after all other engineers had declared the feat impossible. Stephenson spread branches of trees and hurdles interwoven with heather on the surface of the bog, and placed a thin layer of gravel over all; upon the sleepers and rails were laid in the ordinary way.

Chatoyancy, or **Change of Colors**, is the property possessed by a few minerals of displaying different colors by reflected light, when the specimen is revolved. Thus labradorite ordinarily has a dull gray color, but when revolved, a position will be reached in which the surface of the specimen will exhibit great sheets of gorgeous blue, green or copper-red colors. The cause of the phenomenon differs in the several minerals showing it. In the case of labradorite it is apparently due to interference, while in tiger-eye (q.v.) it is the result of the fibrous structure. The beautiful chatoyancy of cat's-eye (q.v.) usually due to enclosed fibers of asbestos or other fibrous minerals, is more properly regarded as opalescence. Compare also **PLAY OF COLORS** and **SCHILLER**.

Chatrian, shā-trē-ân, **Alexandre**. See **ERCKMANN**, **EMILE**.

Chats'worth, England, the celebrated estate of the Dukes of Devonshire, situated in the

CHATTAHOOCHEE—CHATTANOOGA

parish of Edensor, in Derbyshire. It was among the domains given by the Conqueror to his natural son, William Peveril. It was purchased in the reign of Elizabeth by William Cavendish, who commenced to build a mansion on it, which was completed by his widow, the Countess of Shrewsbury. The present building was nearly completed by the first Duke of Devonshire, and a new wing was added by the sixth Duke. The façade is 720 feet long, or with the terraces, 1,200 feet. The mansion forms a square, with an inner court, and is remarkable for the collections of pictures and statues it contains. The park is about 11 miles in circumference. The grounds have been laid out by Loudon and Sir J. Paxton. The conservatory covers nearly an acre, and is 65 feet high. In the old building Mary Stuart was imprisoned for 13 years. Hobbes, the philosopher, lived for some time here.

Chattahoo'chee, a river in the northern part of Georgia, rising in the Appalachian Mountains, and flowing first west and then south, forming, for a considerable distance, the boundary between the above State and Alabama. In its lower course, after the junction of the Flint River from the east, it is named the Appalachicola, and is navigable to Columbus for steamboats. Total course, about 550 miles.

Chattahoo'chee Stage, in American geology, the lower rocks laid down in older Miocene time along the Atlantic coast of what was then the continent of North America. Strata of this stage probably extend, except for a break in Maryland and Virginia, from Cape Cod to Texas, and in the north are clays and uncompacted sand, changing to limestones in the south. The typical exposures of the Chattahoochee stage are on the Chattahoochee River in southwest Georgia and northwest Florida. Here are beds of clay, marl, and limestone about 200 feet thick. The Chattahoochee stage corresponds in age to the John Day beds in Oregon, and to some of the Miocene gold-bearing gravels of the Sierra Nevada. See **MIOCENE SERIES**; **TERTIARY SYSTEM**.

Chattanooga, Tenn., a city and county-seat of Hamilton County, an important railroad, trade, and manufacturing centre, on the south bank of the Tennessee River, and on the Southern, Central of G., Nashville, C. & St. L., Cincinnati, N. O. & T. P., Alabama G. S., and other R.R.'s. It is situated near the Georgia and Alabama boundaries, at the base of the Cumberland plateau, 698 feet above the level of the sea. It is the centre of, and the largest place in, the quadrangle formed by Nashville, and Knoxville, Tenn., Birmingham, Ala., and Atlanta, Ga., distant respectively 151, 112, 143 and 137 miles. The district around as the gateway of the Cumberland range between the three States, was one of the greatest strategic points during the Civil War, and is historic for many bloody and famous battle-fields. To the southwest is Lookout Mountain, commanding a superb view of six or seven States; on the east is Missionary Ridge; and south by east, a few miles away in Georgia, is the field of Chickamauga, now turned by the government into a national military park—to be also the seat of a permanent army post, where several thousand State militia are to be exercised yearly in evolution by regular army officers. The Seventh United

States Cavalry is stationed there, and barracks are under construction. At the southeast corner of the city itself is a national cemetery, one of the largest in the country, containing 13,362 graves. The whole region is a noted tourist resort, for historic and scenic reasons. The finest structures in the city are the custom-house of marble, and the *Times* building. The Baroness Erlanger Hospital is the most noted charitable institution. For higher education, it contains the U. S. Grant University, the Chattanooga Medical College, and the Chattanooga Normal University. There is also a public library, to which Mr. Andrew Carnegie has donated \$50,000 for a library building.

Trade and Manufactures.—The river here is navigable eight months in the year, and the Muscle Shoals Canal gives unbroken passage to its mouth by the Chattanooga & Tennessee River Packet Company; while northeastward, steamers run to Kingston, and at high water to Knoxville, 200 miles, by water. But the great and growing importance of Chattanooga is in manufacturing, which it owes to the adjacent deposits of coal, iron, clays, and many other minerals, and the forests. It has a larger variety of small manufactures than any other Southern city, and some of great magnitude. The chief are iron and iron goods, flouring and grist-milling, lumber and furniture, and patent medicine. The first of these in 1900 produced \$2,553,422 worth of goods; the second \$2,287,268; the third \$922,000. It has the largest manufacture of steam boilers in the United States, next to Erie, Pa.; the largest steel-roofing, wagon, furniture, refrigerator, hosiery, and patent-medicine works in the South; the largest oak-bark tanning and metallic paint works in the United States, and the largest manufacture of kitchen furniture, iron soil-pipes, acetylene gas-burners, slate-pencils, and curtain poles in the world. In 1900 there were 332 plants, producing goods to the total value of \$12,033,780; there are now 370; and the increase of employees is said to have been 20 per cent since 1900. There are seven banks in the city, with deposits of over \$6,250,000, and five of them are in a clearing-house.

Government and Finances.—There is a two-years' mayor and a bicameral council. The annual outlay is about \$300,000, the heaviest item in 1902 being \$48,500 for schools. In 1902 the assessed valuation was \$14,000,000, the debt \$931,000, and the municipal tax-rate \$14.50 on a thousand.

Population and History.—Chattanooga, originally called Ross Landing, first appears in the census in 1860 with 2,545 people. In the War, being a storm centre, it was nearly destroyed; but as in the case of some other southern cities, the War was its making. It was an important military post, and the iron industry started in a rolling-mill opened in order that the ruined railroads might be rebuilt. The attention of capital had also been called to its great advantages of situation. In 1870 it had a population of 6,093; in 1880, 12,892; and in 1890, 29,100. The growth of the city was retarded by the general business depression which followed the financial reverses of 1893; but a revival came with the concentration of some 70,000 soldiers there in 1898, and the consequent immense disbursements. Since then it has been rapidly moving forward; and though the Federal census of

CHATTANOOGA

1900 shows 30,154, it is claimed that the corporate limits, which are less than four square miles, are too restricted, and that the addition of the 22 suburbs belonging to it would raise the population to nearer 55,000. The increase in school attendance, in post-office receipts, etc., has been very large in the past three years.

B. L. GOULDING,

Vice-President Chattanooga Library Association.

Chattanooga, Battle of. At the close of the battle of Chickamauga, Ga., 20 September, the Union army, in withdrawing from the field, having interposed at Rossville, Ga., between

Missionary Ridge the same distance east of it, the mountain and the ridge being parallel, running nearly north and south and about four miles apart. The Tennessee River touches the base of Lookout. The city lies to the northeast in a great bend of the river. The advance line of the Confederates was half way between the ridge and the city, upon a low intermediate ridge, at the right of which was Orchard Knob, an isolated knoll rising some 60 feet above the plain.

Lookout Mountain commanded the river line to Bridgeport and Stevenson, the main depots

**CHATTANOOGA, TENN.
AND VICINITY.**

Bragg and Chattanooga, advanced into that city the night of the 21st and morning of the 22d, and immediately began to fortify it. Bragg followed on the 22d, and his lines were soon established in front of the place, his left resting on the Tennessee River and Lookout Mountain, below the city, his centre extending across the plain to the foot of Missionary Ridge, his right being established at the foot of the ridge and reaching toward the Tennessee River above. The north point of the Lookout Mountain range is three miles southwest of Chattanooga, and

of supply. This necessitated a wagon-haul of 60 miles over the Cumberlands and the adjacent range of Walden's Ridge, all precipitous and barren mountains. The Union army was soon running short of supplies, the fall rains rendering the roads almost impassable. On 19 October, the day that Rosecrans had perfected the general features of a plan for regaining the river line of supplies, he was relieved from command and Gen. Geo. H. Thomas assigned, who at once ordered the preparations inaugurated by Rosecrans to go forward.

CHATTANOOGA

Immediately after the battle of Chickamauga Gen. Hooker with the Eleventh and Twelfth corps was sent from the army of the Potomac and arrived at Bridgeport, Tennessee, 30 September. Sherman, in camp east of Vicksburg, had been ordered up with four divisions. Grant was sent to take general command. Upon arriving, 23 October, he approved the plans for opening the river, and directed their execution. Gen. Hooker was to advance into Lookout Valley, and a co-operating force from Chattanooga under Gen. W. F. Smith was to seize Brown's Ferry below Lookout Mountain, throw a bridge there and form a junction with Hooker. These movements were successfully executed during 27 and 28 October. The Eleventh corps (two divisions) and Geary's division of the Twelfth corps entered Lookout Valley the afternoon of 28 October, the Eleventh corps proceeding to Brown's Ferry and formed a junction with Gen. Smith's troops from Chattanooga. Geary, with six regiments of his division, halted near Wauhatchie Station. At midnight of the 28th Geary was attacked by Jenkins' (Hood's) division, six regiments, of Longstreet's corps, supported by Law's division. Schurz's division coming to Geary's support, Longstreet's troops after three hours' fighting withdrew to the east side of Lookout, and the Wauhatchie or Lookout Valley remained thereafter in Union control. Abundant supplies by the river then reached Chattanooga by a short wagon-haul from Brown's Ferry. On 4 November, shortly after the battle of Wauhatchie, Longstreet's corps was detached by Bragg and sent to Knoxville.

The battle of Chattanooga, which occurred three weeks later, embraced three days' operations, 23, 24, and 25 November. At the opening Bragg's lines were as already described. Hooker, with Geary's division and Cruft's from the Fourth corps of the Army of the Cumberland, occupied Lookout Valley, the Army of the Cumberland and the Eleventh corps were on the lines about Chattanooga, and Sherman with three divisions had crossed at Brown's Ferry and was concealed behind the hills above Chattanooga and on the opposite side of the river from the city.

Gen. Grant's force for his firing lines was about 60,000, and the Confederates' a little less than 40,000. The formidable natural positions of the latter were held to give them superior advantages.

Grant's plan of battle was for Hooker to hold Lookout Valley against Bragg's left. Sherman was to cross the Tennessee opposite the north end of Missionary Ridge, which was unoccupied, and carry it to the railroad tunnel about half a mile south of its northern end. Sherman, then, astride of the ridge, was to move south; while Thomas, with the Army of the Cumberland before the city, was to connect its left with Sherman's right, and together sweeping south they were to clear the ridge and the valley. As the engagement progressed, every feature of this plan was changed by unexpected developments.

At noon, 23 November, Gen. Thomas, being directed by Grant to ascertain if the Confederates still occupied their lines and camps between the city and Missionary Ridge, paraded five divisions in full view of the Confederate positions, which, as was afterward ascertained,

was at first supposed to be a review. Wood's division was in the centre advanced, Schurz's and Steinwehr's divisions of the Eleventh corps were refused on the left, and Sheridan's and Baird's on the right. At a bugle signal at 1:30 p.m. the centre advanced rapidly, and, after a sharp contest, captured Orchard Knob, and forced the abandonment of the entire line of the Confederates through the centre of the plain, reversed the works at and near the Knob and held them. This was the first day's battle.

The night of the 23d Sherman with three of his four divisions which had reached his concealed camps opposite the city and north of it, marched to the North Chickamauga, where 116 pontoon boats awaited him. These were filled with soldiers, floated down the creek to the river, and thence to the opposite shore, and by daylight of the 24th 8,000 of Sherman's troops were in line fronting Missionary Ridge, two miles from it, and opposite its northern extremity, which point was not occupied by the Confederates until 2:30 in the afternoon. At 1 o'clock the three divisions, and one from the army of the Cumberland which had covered the movement having crossed, the lines were advanced, and at 4 o'clock a range of unoccupied hills north of and overlooking the north end of Missionary Ridge was occupied without resistance, and strongly intrenched under the supposition that these formed the north end of the ridge contemplated in the order of battle. The mistake was due mainly to the misty weather, and the omission of any reconnaissance.

At 2:30 p.m. Cleburne's division arrived at the north point of the ridge and entrenched.

Gen. Thomas, having obtained Grant's permission to make a demonstration against the Confederate position on Lookout, Hooker made ready to move at an early hour on the 24th.

The Confederates held the top of the mountain, which was a narrow plateau 1,700 feet above the valley, protected by perpendicular palisades varying from 75 to 250 feet high. From the foot of these walls of rock the mountain sloped westward to Hooker's position in Lookout Valley eastward to the plain south of Chattanooga, while its north slope descended to the Tennessee River opposite Moccasin Point. It was approximately a mile and a half from the foot of the palisades to the valley. The battle took place on these slopes. No Union troops reached the top of the mountain during the engagement. The morning of the 24th, Brown's and Pettus' brigades of Stevenson's Confederate division, with a battery of four Napoleons, occupied the summit, and Walthall's and Moore's brigades of Cheatham's division the slopes of the mountain, Walthall's holding the western slope and Moore's the northern.

Hooker's forces consisted of three brigades of Geary's division of the Twelfth corps, two brigades of Cruft's division of the Fourth corps, and two brigades of Osterhaus' division of Sherman's army. This latter division had been prevented from following Sherman over the river by the breaking of the pontoon bridge at Brown's Ferry. Hooker's aggregate strength was something over 9,000. Walthall's brigade, which sustained almost the entire attack until the western and northern slopes had been carried, did not number over 1,700. There were 250 men of Moore's brigade on picket, which were mostly captured early in the engagement.

CHATTANOOGA

The head of Hooker's column crossed Lookout Creek at Light's Mill near Wauhatchie, at 8 o'clock in the morning, and, concealed by the fog which hung over the mountain, marched directly up the western slope until the head of the line reached the base of the palisades. His line then faced toward the north point of the mountain, distant about two miles.

After an advance of a mile and a half with Geary's brigades, Cobham's, Ireland's, and Candy's, in advance, and Whitaker's of Cruft's division in reserve, the troops struck the left flank of Walthall's line protected by slashed timber. This was carried, and in the face of stout resistance the Confederates were driven around the north point of the mountain, and across its northern slope. As Geary's attack opened, first Grose of Cruft's division and next Wood and Williamson of Osterhaus', successively joined the left of the lines, and advanced with the swinging movement on the slopes of the mountain. Until the northern slope had been carried to the Craven House, Walthall had no assistance. Moore advanced as he was being pushed back from the Craven House, but was immediately repulsed. Pettus arrived at one o'clock and relieved Walthall after he had withdrawn some 400 yards from the Craven House. This enabled Walthall to procure ammunition, re-form, and take his place on the line again. This position was held until three o'clock in the morning, when, the troops and supplies from the top having been withdrawn and safely started across the plain for the Missionary Ridge line, this final line was also withdrawn, and the mountain abandoned. The troops on the summit, on account of the fog, could do little damage to the Union lines. Hooker was materially assisted by batteries on the elevated points in Lookout Valley, and those across the river on Moccasin Point, which swept the northern slope. The next morning the Union forces occupied the summit.

The capturing of Lookout Mountain decided Gen. Bragg to withdraw his whole army from the plain to the crest of Missionary Ridge, except as heavy picket forces were left in the entrenchments at the base of the ridge.

Hooker's losses at Lookout, and the next day at Missionary Ridge, which were small but not definitely reported, were: Killed, 81; wounded, 390. The Confederate loss was: Killed, 21; wounded, 177. Walthall lost 845 captured, mostly from his long picket line at the base of the mountain. Moore's missing were 199, and Pettus' 9.

During the night of the 24th and the early morning of the 25th, Bragg concentrated his army on Missionary Ridge, and in the earthworks at its base. This was his first occupation of the crest of the ridge in force. His new line extended from Rossville, a distance of eight miles to the north end of the ridge, his divisions from Rossville northward being Stewart's, Breckinridge's (Bate's), Hindman's (Patton Anderson's), Cheatham's, Walker's, Stevenson's, and Cleburne's.

The battle of the 25th opened soon after seven o'clock by an assault of Sherman upon the north end of the ridge, defended by Cleburne. Sherman's force consisted of his own divisions of Morgan L. Smith, Hugh Ewing, and John E. Smith, with the divisions of Jeff. C. Davis from the Army of the Cumberland, and Schurz and Steinwehr of the Eleventh corps. While the

four brigades of Corse, Matthies, Raum, and Giles A. Smith reached the crest at different periods, none was able to maintain position there, though Corse and Smith held on stubbornly under the crest until toward evening, when all were driven from the slopes. The fighting of the troops sent in was persistent and most courageous, but Cleburne, at first alone, and later supported by Stevenson's division and a part of Walker's, repulsed all assaults. The last one, about 3:30 P.M., was especially serious.

Grant, on Orchard Knob, observing this repulse, ordered Gen. Thomas to advance his four divisions at the centre against the earthworks at the foot of the ridge as a diversion in favor of Sherman, hoping thereby to cause the withdrawal of Confederate forces from his front. The four divisions which were ranged along the Orchard Knob line were, from left to right: Baird, Wood, Sheridan, and Johnson. The line was two and a half miles long, and faced the ridge at distances from three quarters of a mile to a mile from it. There were 11 brigades and 89 regiments in the lines as prepared for the assault. The formation was such as to present the appearance of being four lines deep. At a signal of six cannon shots from Orchard Knob the four divisions rushed for the earthworks at the foot of the ridge. On the summit opposed to this advance were 13 brigades and 16 batteries. The cannonading of nearly 100 guns from the crest was terrific, and the line was soon under rifle-fire from the works at the base, but the entire line of earthworks was captured as soon as the troops by running could reach them. Reforming their lines in the earthworks, Baird's division on the left and Johnson's on the right began the storming of the ridge without further orders. In Baird's division the horses of field officers had been left behind at the start, because as he announced he had intimations that the intention was to go to the summit, and it was easy to see that the slopes were too steep for mounted men to ascend. In the same way Johnson's men were informed at the start that the movement was to be an attack on the ridge. At the centre in Wood's and Sheridan's divisions the orders as understood by most were to stop at the rifle-pits, but the men ignored these and started forward, and soon orders were received to go to the top. The whole line of brigades gained the crest so nearly together that it has always been difficult to determine which, if any one, was the first.

The long lines of the storming party moved up the slopes with few checks, and in an hour had carried three miles of the crest and captured 37 guns and about 2,000 prisoners.

Just as the orders were given Thomas for this assault at the centre, Hooker, who had descended Lookout at one o'clock and started to attack the south end of the ridge in Rossville Gap, reached that position. He had been detained by the necessity of rebuilding a bridge over Chattanooga Creek. He at once sent Osterhaus' division through the gap and turned it north along the east side of Missionary Ridge. Cruft's division assaulted and carried the south end of the ridge in the gap while Geary moved along the western base of the ridge and finally ascended to the crest, reaching it soon after the right of Thomas' assault had occupied it.

As Baird's division reached the crest, it turned northward and became hotly engaged

CHATTEL MORTGAGE — CHATTERTON

with Walthall's brigade, assisted by Jackson's and Moore's, of Cheatham's division. Darkness coming on, the fighting ceased. Walthall's stand across the ridge had made it possible for Cleburne's, Stevenson's, Walker's, and Cheatham's divisions to withdraw in order and unmolested. The centre and left retreated in general confusion, Bate's division, however, soon rallying for a stout resistance as rear guard.

Two myths of the battle have gained general currency. The movements of the Confederate troops which retired from Lookout Mountain and were early sent to confront Sherman gave rise to the report that Bragg was weakening his centre to concentrate against Sherman. But not a single soldier or gun was sent from the centre against Sherman during the day. On the contrary, three brigades, John C. Brown's, George Maney's, and Alfred Cummings', were hurried from Sherman's front to resist the assault of Gen. Thomas at the centre.

The second long perpetuated error is that when Gen. Sherman advanced to the unoccupied hills beyond the north end of Missionary Ridge he had carried the ridge to the tunnel as was contemplated in the order of battle. He did not secure any portion of the ridge during the battle, although those troops which were put in fought desperately. Eleven brigades of his force were held as reserves and were not engaged, Gen. Sherman thinking it necessary to guard against an attack upon his left.

Bragg was promptly pursued. His rear guard made a stubborn stand at Ringgold Gap, but his army was first rallied at Dalton, where it remained until the opening of the Atlanta campaign in the spring of 1864.

The losses at Chattanooga, including the three days' battles and the affairs in pursuit to Ringgold, were for Grant: Killed, 703; wounded, 4,722; missing, 349; total, 5,844; for Bragg: Killed 361; wounded, 2,180; missing, 4,146; total, 6,687. Consult 'War of the Rebellion Records,' Vols. XXX. and XXXI., Parts 1 and 2.

H. V. BOYNTON.

Chatel Mortgage, a transfer of personal property as security for a debt in such manner that upon default the chattel becomes the property of the mortgagee.

In the absence of statute no special form is necessary, the terms depending to a great extent on the intention of the parties. Between the parties to a mortgage, a delivery is not necessary, but to be binding on creditor's delivery to the mortgagee or notice to the creditors is necessary. In mortgage, title, and possession passes; in pledge, possession passes, but title remains in the pledgor.

At common law it was necessary for the chattel to be in possession of the mortgagor at the time the mortgage was given, so as to be binding against creditors; but if the mortgagor acquired title after the mortgage had been given, it was good as between the parties, but not as to creditors. In equity a chattel mortgage is considered in the nature of an executory agreement.

Chattels, property movable and immovable, not being freehold. The word chattels is originally the same word with cattle, all property being reckoned in early periods by the number of heads of cattle possessed, or their equivalent. From the fact that cattle were reckoned

by the head, it appears probable that they were called *capitalia* (from the Latin *caput*, the head), which became contracted by syncope into *cap-talia*, and then *catalia*, whence the legal term *catalla*, and our "chattels" and "cattle." Hence the word chattels signified originally only movable property, but in course of time came to be applied to all property not held in feudal tenure. Chattels are divided into real and personal. Chattels real are such as belong not to the person immediately, but dependently upon something. Any interest in land or tenements, for example, is a real chattel; so also is a lease, a rent for a term of years, an interest in advowsons, etc. Chattels personal are goods which belong immediately to the person of the owner, and include all movable property. Chattels usually pass to the executor, except such, for instance, as trees, which may not be severed from the freehold, and therefore pass to the heir.

Chatterers, the popular name of certain insessorial birds of the family *Ampelidæ*, genus *Ampelis*, as the Bohemian chatterer or waxwing (*A. garrula*) and the chatterer of Carolina (*A. cedrorum*).

Chatterton, Thomas, English poet: b. Bristol 20 Nov. 1752; d. there 24 Aug. 1770. At about 10 years of age he acquired a taste for reading, which became, from that period, a kind of ruling passion. His former melancholy gave way to vivacity and vanity, and dreams of glory, fortune, and immortality. His father had accidentally obtained possession of a number of old parchments of the 15th century. Many of these were consumed in the family, but several fell into the hands of Chatterton, who after a few days declared that he had discovered a treasure. He then procured glossaries of the old dialects of the country, and in 1768, when the new bridge at Bristol was completed, he inserted a paper in the Bristol 'Journal,' entitled 'A Description of the Friar's First Passing Over the Old Bridge, Taken from an Ancient Manuscript.' He was then but 16 years old. Upon being questioned as to the manner in which he had obtained it, he finally asserted that he was in the possession of several valuable old manuscripts, taken from an old chest in Redcliffe Church. He had been engaged for a year in the composition of several poems, which he attributed to different ancient writers, particularly to one Rowley. In 1769 he ventured to write to Horace Walpole, who was then engaged upon his 'Anecdotes of Painters,' giving him an account of a number of painters who had flourished in Bristol, which Chatterton pretended to have discovered along with several ancient poems in that city, and received a polite answer. Discontented with his situation, he went to London. The favorable reception which he there met with from the booksellers inspired him with new hopes. He wrote for several journals on the side of the opposition and indulged the hope of effecting a revolution, boasting that he was destined to restore the rights of the nation. Failing to procure the rewards which he had expected, his situation daily became worse. Although extremely temperate, and often voluntarily confining himself to bread and water, he was frequently destitute even of these necessities. At last, after having been several days without food, he poisoned himself in 1770, when not yet 18 years old. His works were more extensively read as

CHAUCER—CHAUFFEUR

the public became acquainted with the history of his misfortunes. The most remarkable are the poems published under the name of Rowley, which he composed at the age of 15 years. They display a vigorous and brilliant imagination, fertility of invention, and often a deep sensibility. Among the poems which he published under his own name his satires deserve the preference. His prose writings are spirited. Prof. Skeat's edition of his poems is one of the best. See biographies by Dix (1837), Wilson (1869), and Masson.

Chaucer, chā'sér, **Geoffrey**, English poet, "the father of English poetry": b. London probably about 1340; d. there 25 Oct. 1400. The date commonly assigned till lately for his birth was 1328, but all the evidence that there is to show on this matter points to a date considerably later. He was the son of a vintner named John Chaucer, but nothing is known of his education, and the earliest fact of his career that has been ascertained is that he is mentioned in the household book of the wife of Prince Lionel, second son of Edward III., in 1357. In 1359 he bore arms in France, and was taken prisoner at Retiers in Brittany, but he was ransomed the following year. The next mention of him occurs in 1367, when he is described as a *valettus* of the king, and from 1372 he is styled esquire. It is supposed that the marriage of Chaucer belongs to this period, but the whole circumstances are obscure. What alone is certain is that he received in 1374 a grant of £10 a year for life from the Duke of Lancaster in consideration of the good service which he and his wife, Philippa, had rendered the said Duke. It is thought that this Philippa was one of the ladies-in-waiting to Queen Philippa. She may have been, as some think, a cousin of the poet, but there is good reason to believe that she was the daughter of Sir Payne Roet. These connections increased his favor at court, and in 1367 he received from the king a pension of 20 marks. In 1372 he was sent to Genoa as a commissioner to negotiate a commercial treaty. On returning after a year he was appointed in 1374 comptroller of the customs on wool, skins, and tanned hides in the port of London, an office which was sufficiently lucrative. He was now in tolerably affluent circumstances, was employed by the court in various services, and in 1382 was appointed comptroller of the petty customs in the port of London. In 1386 he was returned to Parliament as knight of the shire of Kent, but in the same year his fortunes fell with those of his patron, John of Gaunt. He was deprived of both his comptrollerships, and thus reduced to a condition of comparative want. Three years later he was again in favor. Though not restored to the offices he had formerly held, he became clerk of the king's works at Westminster Palace and elsewhere, with permission to appoint a deputy. In 1391 he lost this place, but about the same time became a forester of North Petherton Park, Somersetshire. In 1394 he was granted an annuity of £20 for life by the king, and five years later Henry IV. added 40 marks to this, so that at his death his circumstances should have been quite comfortable. Chaucer's most celebrated work, which, although possibly begun in his earlier years, was certainly not all written till near the end of his life, is the 'Canterbury Tales.' These are all in verse, except

the 'Tale of Melibœus' and the 'Parson's Tale.' The work remains unfortunately incomplete. The 'Tales' are distinguished for variety of character-painting and liveliness of description, and are marked alike by humor and pathos. In them, as in others of his works, Italian influence is clearly seen; and that Chaucer borrowed from Boccaccio is well known; yet, as Prof. Hales remarks, "For what is best in his best works he is debtor to no man." Chaucer's principal works besides the 'Canterbury Tales' (first printed by Caxton in 1475) are: 'The Boke of the Duchesse' (1369); 'The Assembly of Foules' (1374); 'Troilus and Cryseyde' (1380-2); 'The Legende of Good Women' (1385); 'The House of Fame' (1386). He also translated Boethius, and wrote a treatise on the Astro-labe (1391). He was buried in Westminster Abbey. See Nicolas, 'Life of Chaucer'; Ten Brink, 'Chaucer: Studien zur Geschichte seiner Schriften' (1870); Lounsbury, 'Studies in Chaucer' (1872); Skeat, 'The Chaucer Canon' (1900).

Chaucer, The Student's, a complete edition of the poet, edited by Walter W. Skeat (1895). In addition to the complete text of all the writings of Chaucer, the volume has a Glossarial Index fully adequate to explain words not known to the English reader to-day.

Chauci, kā'si, an ancient Teutonic tribe, dwelling between the Ems and Elbe on the shore of the German Ocean. They were a peaceful people and lovers of justice. Nothing is said of them in history after the 5th century.

Chaudesaigues, shōdz-äg ("warm waters"), France, a watering-place in the department of Cantal, 28 miles east-southeast of Aurillac. The warm springs have their rise in a volcanic mountain, and are so copious that the water is used from November to April in heating the town. Besides the five hot springs there are three cold springs. Pop. (1901) 1,070.

Chaudet, Antoine Denis, än-twän dü-nē shō-dä, French sculptor: b. Paris 31 March 1763; d. there 19 April 1810. In his 21st year he obtained the first prize of the Academy, and went to Rome, where he studied the masterpieces of the ancients. On his return he became a member of the Academy. His first work was a bas-relief under the peristyle of the Pantheon. Among his other works are 'La Sensibilité,' a young girl astonished at the motion of the sensitive plant, which shrinks from her touch; the statue of Cyparissa, etc. Chaudet also excelled as a painter.

Chaudfontaine, shō-fōn-tän, Belgium, a village in the province and four miles from Liège, on the Vesdre, with hot springs much frequented in summer. Pop. (1897) 1,811.

Chaudière, shō-dē-är, a river of Canada, which has its rise in Maine, near the source of the Kennebec, and flows north for 120 miles and joins the St. Lawrence about six miles above Quebec. Between two and three miles above its mouth it forms the Chaudière Falls. Chaudière Lake is an expansion of the Ottawa River just above the city of Ottawa.

Chauffeur, shō-fér (Fr. a "stoker"). This term has recently come into use in the English language to designate at first the engineer or motorman of a steam-driven road carriage; but

GEOFFREY CHAUCER.

CHAUFFEURS — CHAUNY

by extension it is now applied to any professional machinist who operates an automobile, electrically or otherwise propelled.

Chauffeurs, shō-fēr, or **Garrotteurs**, gār-ōt-tēr, an organization of brigands during the Reign of Terror in France. Their headquarters were first in the forest of Orgères, near the city of Chartres, and afterward they infested other parts of the country in bands organized under the leadership of Johann Buckler, surnamed Schinderhannes, until 1803, when the measures adopted under the consulate put a stop to their depredations. They garrotted their victims, and tortured and burned (*chauffé*) their feet to make them disgorge their treasures. While engaged in burglaries they put a black veil over their faces or painted them with soot.

Chaulmugra, chāl-mūg'ra (*Gynocardia odorata*), a tree of the order *Bixaceæ*, which grows in eastern countries, and from the seeds of which an oil is obtained that has been long known and highly valued in India and China as a remedy in skin diseases. The oil has been introduced into Great Britain, and is said to be useful in rheumatism, sprains, etc.

Chaumette, Pierre Gaspard, pē ār gās-par shō-met, French revolutionist: b. Nevers 24 May 1763; d. 13 April 1794. The opening of the Revolution found him a clerk at Paris. He attached himself to Camille Desmoulins, and soon gained such popularity by his extravagant sansculottism that he was appointed procurator of the commune of Paris. In his zeal he rejected his own Christian name, Pierre, as having been sullied by saintly associations, and styled himself "Anaxagoras." The institution of the tribunal of the Revolution, the decree for a revolutionary army, and the law against suspected aristocrats, were largely due to his efforts. One of his proposals was that all Parisians should wear sabots, another that the Tuileries and Luxembourg gardens should be planted with potatoes. His antics in connection with the "worship of reason" excited the disgust of Robespierre, who devised measures for bringing the whole company of actors under Hébert to the scaffold.

Chaumont, shō-môû, France, the capital of the department of Haute Marne, on a height between the Marne and the Suize, 145 miles southeast of Paris by rail. It is well built, has a fine town-hall, court-house, communal college, public library, church dating from the 13th century, the ruins of a castle belonging to the counts of Champagne, and an iron bridge of 50 arches on which the railway crosses the Suize. There are manufactures of gloves, cutlery, leather, woollens, sugar, etc.; and a trade in the iron and iron goods of the department. Here was signed, March 1814, a treaty between Great Britain, Russia, Austria, and Prussia, in which these powers pledged themselves to accomplish the overthrow of Napoleon and restore peace to Europe. Philip Le Bon, the first who advocated the use of gas for illumination, in France, was a native, and his memory is honored by a bronze statute. Pop. (1901) town 11,697.

Chauncy, chān'sī, **Charles**, Puritan clergyman: b. Yardleybury, Hertfordshire, November 1592; d. 19 Feb. 1672. He was the second president of Harvard College, and the ancestor of all who bear the name of Chauncy (or Chauncey)

in the United States. Educated at Westminster and Cambridge, he made the acquaintance of Archbishop Usher, and was appointed professor of Greek at Cambridge. Leaving that position soon after, he took the vicarage of Ware, Hertfordshire. His stern Puritanism involved him in a difficulty with the ecclesiastical judicatories on the publication of the 'Book of Sports,' and the railing out of the communion table. He was imprisoned and fined for his denunciation of these acts of the Church, and recanted, but soon repented of his recantation. He therefore determined to embark for New England, where he arrived a few days before the great earthquake, 1 June 1638. Here he was reordained, and for three years remained in Plymouth as assistant pastor, and then took the pastoral charge of the church in Scituate, Mass. There he remained until the change in the ecclesiastical polity of England, when he resolved to return to his vicarage in Ware, which had invited him home. But the first president of Harvard College, Mr. Dunster, resigning just at that time, the office was offered to Mr. Chauncy and accepted (1654), which station he held until his death. He was not a voluminous writer, and a few theological works and a number of sermons are all that remain of him. He was zealous against wearing long hair, and baptizing the children of non-communicants.

Chauncy, **Charles**, American minister, descendant of the preceding: b. 1 Jan. 1705; d. 10 Feb. 1787. He graduated at Harvard College in 1721, and was ordained pastor of the First Church in Boston in 1727. He was a copious writer, and published many works; among the rest, a 'Complete View of the Episcopacy,' being the substance of a discussion with Dr. Chandler, of New Jersey; 'Seasonable Thoughts on the State of Religion in New England'; 'Discourse on Enthusiasm'; 'Remarks on the Bishop of Llandaff's Sermon'; 'Mystery Hid from Ages, or the Salvation of all Men'; 'The Benevolence of the Deity.' He was for 60 years the minister of one parish.

Chauncey, **Isaac**, American commodore: b. Black Rock, Conn., 20 Feb. 1772; d. Washington 27 Jan. 1840. He commenced his career in the merchant service, in which he became distinguished for seamanship, enterprise, and energy. He entered the navy as lieutenant in 1799, and early in 1802 was appointed acting captain of the frigate Chesapeake, the flag-ship of a squadron ordered to the Mediterranean to operate against Tripoli. In the brilliant operations before Tripoli in 1804 he bore a distinguished part. In April 1806 he was promoted to the rank of captain. In the War of 1812 the naval superiority on the lakes became an object of high importance, and Commodore Chauncey, then in command of the navy yard at New York, was appointed to command on all the lakes except Champlain, winning the highest honors in this position. He commanded the Mediterranean squadron 1816-18 and at the time of his death was president of the navy commission.

Chauny, shō-nē, France, a town in the department of Aisne, on the right bank of the Oise, 19 miles west by north of Laon. It has manufactures of glass, sugar, chemicals, etc. Pop. 9,927.

CHAUS — CHAUTAUQUA

Chaus, *kā'us*, the native name for the East Indian jungle-cat (q.v.).

Chautauqua, *sha-tā'kwā*, a popular educational centre on Chautauqua Lake in the southwestern part of New York State. It is an incorporated town, 165 acres in extent, on the upland terraces of the lake, at a high elevation, although lying in a lowland corner of the State. Chautauqua is 70 miles south of Buffalo, 200 miles north of Pittsburg, and 450 miles west from New York. It is reached by the Pennsylvania and Erie railways. Chautauqua has numerous large and commodious school buildings; several thousand cottages in the woods; an hotel called "The Athenæum"; a few shops or "stores"; a plain college building on a hill-top, with a beautiful lake-environment; a so-called "hall of philosophy" which is a wooden temple with supporting pillars, open to the summer breeze, and seating 3,000 people; and a vast amphitheatre, like a Greek theatre dug out of a hillside, but well roofed, well lighted by electricity, and capable of seating 5,000 or 6,000. For nine months of the year it is a town of 1,000, but during the summer, while the classes are being held, has a population ranging from 30,000 to 60,000.

As an educational institution Chautauqua has become a centre of great importance. It may be considered primarily as an unconscious educational adaptation of the open-air public assembly such as the American mass-meeting or town-meeting, or the religious camp-meeting. The Chautauqua Assembly was established by Lewis Miller in 1874 at Fairpoint, for Bible study and the training of Sunday-school teachers. But the ideal and purpose of the assembly were gradually broadened; and to the specifically religious study a great variety of subjects were added. The religious spirit, however, pervades the work of the assembly. The best exponent of the spirit of the institution was its chancellor, Dr. John H. Vincent. He infused into it the idea that all sound learning is sacred, and that the secular life may be pervaded by religion.

The work done at Chautauqua has been thus summarized in one of the New York State bulletins: "For the many there are popular lectures, concerts, entertainments; for a somewhat less number there are philosophical, scientific, and literary lectures in progressive courses; for the comparatively few are provided means for careful study under able and well-known instructors." The work may be further classified as follows: (1) the college of liberal arts, instruction in languages, mathematics, psychology, political economy, science, etc., by well-known men, continued during the winter by correspondence; (2) school of pedagogy; (3) schools of sacred literature; (4) classes in art, music, physical education, etc.; (5) lecture courses, similar to the university extension lectures, without extra fee; (6) public lectures and addresses by those prominent in various departments; (7) recreative entertainments, concerts, recitals, stereopticon exhibitions, etc.

An important part of Chautauqua's influence is made effective through classes and courses for home study; prominent among these being the Chautauqua Literary and Scientific Circle (C. L. S. C.), founded in 1878. The C. L. S. C.

is a well-directed system of home reading in literature and science, carried on in connection with local reading circles, and practically aided by many good suggestions in a monthly magazine called 'The Chautauquan.' The course of reading occupies four years, which are called respectively the Greek year, the Roman, the English, and the American, from the relative prominence given to the history and literature of those four peoples. The text-books on England and the United States, Greece and Rome, and other subjects, social and economic, are prepared by good writers representing American colleges and universities. With the regular courses in history are combined corresponding literary courses and studies in art, religion, and natural science. In the American year, the special subjects are religion, American history, literature, government, diplomacy, social institutions, and physiology.

The entire expense for the required books and the illustrated magazine is about \$5 per annum. The text-books are now written by Chautauqua specialists, and published by the assembly. The course of reading is carried on by Chautauquans at home, but once a week they meet in local circles in neighborhoods and villages all over the country and, under the best local guidance they can find, devote an evening to the discussion of topics suggested by 'The Chautauquan' and other private reading. The number of these local reading circles during the past 20 years has been about 10,000, and the total enrollment of Chautauqua readers has been about 250,000. By far the larger number fail to complete the four years' course, but it is estimated that about a half have done consecutive reading for two years. A "saving remnant" of about 40,000 continue to the end and win a simple certificate. The graduates are also encouraged to form local educational clubs and continue special study.

Next in importance to the C. L. S. C. are the "schools," wherein definite class instruction, begun under competent direction at Chautauqua, is continued by correspondence with the professor or representative of the "school" throughout the year. This combined work done in residence and by correspondence may, in a few rare cases, lead to the degree of bachelor of arts or bachelor of science, conferred, however, only after searching tests. The degree-giving power is vested in the regents of the University of the State of New York, whose academic honors are, by State examinations, better guarded than are those of some academic corporations in America. A great variety of regular and advanced work is offered; including courses in history, science, pedagogy, and theology (for which the degree B.D. is given).

The "Chautauqua idea," of which much has been said and written, is best expressed by Bishop Vincent, who says: "Chautauqua pleads for universal education; for plans of reading and study; for all legitimate enticements and incitements to ambition; for all necessary adaptations as to time and topics; for ideal associations, which shall at once excite the imagination and set the heart aglow. . . . A college is possible in every-day life if one choose to use it; a college in house, shop, street, farm, market, for rich and poor, the curriculum of which runs through all of life, a college which trains men

CHAUTAUQUA LAKE — CHAYOTE

and women everywhere to read and think and talk and do; . . . this is the 'Chautauqua idea.' »

Chautauqua Lake, a beautiful lake situated in Chautauqua County, N. Y. It is 18 miles long and from one to three miles wide, the highest navigable water on the continent, 730 feet higher than Lake Erie and 1,400 feet above the sea-level. Chautauqua was the Indian name for this lake, the shores of which are a natural "divide" between waters which flow northeastward with the St. Lawrence from the Great Lake district and waters which flow southwestward to the Mississippi River and the Gulf of Mexico. On its banks is the village and summer resort of Chautauqua, the centre of a religious and educational movement of large and growing interest. See CHAUTAUQUA.

Chauveau, shō-vō, **Pierre Joseph Olivier**, Canadian statesman and writer: b. Quebec 30 May 1820; d. there 4 April 1890. Among his contributions to literature were many popular poems, including 'Simple Joys,' 'Donnaconna,' 'Letters to M. de Puibusque,' also 'Tour of H. R. H. Prince of Wales in America' (1861), 'Souvenirs and Legends' (in prose and verse) (1877), and 'François Xavier Garneau, His Life and Works' (1883).

Chauveau-Lagarde, lā gārd, **Claude François**, klōd fran-swā, French advocate: b. Chartres 1756; d. 1841. He studied law in his native town and began to practice in Paris shortly before the outbreak of the Revolution. He became celebrated for his eloquent defense of those on trial in the Reign of Terror. He was the advocate of Marie Antoinette at her trial and also of Charlotte Corday. Others of his clients were Brissot and Madame Elizabeth of France. His defense of Mirandola saved the latter from the scaffold. In 1814 he was ennobled by the government of the Restoration and two years later he published an account of the trial of Marie Antoinette and Princess Elizabeth.

Chauvenet, shō-vē-nā', **William**, American astronomer and mathematician: b. Milford, Pa., 24 May 1819; d. St. Paul, Minn., 13 Dec. 1870. He was graduated at Yale in 1839, and became instructor in mathematics at the Philadelphia Naval Asylum in 1841, professor of mathematics and astronomy at the United States Naval Academy in 1845, and professor of astronomy at Washington University, St. Louis, in 1859. In 1862 he became chancellor of the last institution. He wrote 'Spherical and Practical Astronomy,' 'Elementary Geometry,' and similar works.

Chauvinism, shō'vīn-izm, a French word derived from Nicolas Chauvin, a soldier of the French Republic and of the First Empire. His name became a synonym for a passionate admirer of Napoleon, and the word Chauvinism was formed to signify the almost idolatrous respect entertained by many for the First Emperor, and generally any feeling of exaggerated devotion, especially of patriotism. A vaudeville, 'La Coquarde Tricolore,' in which there was a character named Chauvin, with a song that became immensely popular, fixed the word in the French language. The word is now used to express exaggerated patriotism of an aggressive type, jingoism, etc.

Chaux-de-Fonds, shō-dé-fōn, **La**, Switzerland, a town in the canton of Neuchâtel, and nine miles northwest of the town of Neuchâtel, in a deep valley of the Jura. Chaux-de-Fonds and the neighboring village of Locle are the chief centres of watch-making in Switzerland. Pop. 35,971.

Chaves, Francisco de, frān-thēs'kō dā shā'vēs, Spanish soldier of the 16th century: d. Lima, Peru, 26 June 1541. He was a trusted companion of Pizarro in the conquest of Peru, but disapproved of the execution of the Inca, Atahualpa. About 1539 he was sent out by Pizarro to settle Conchucas, but within a few months was assassinated at the same time as his leader.

Chaves, Brazil, a small town in the province of Para, on the north coast of the island of Marajo, at the mouth of the Amazon. Pop. 8,500.

Chaves, shā'vēsh, Portugal, the ancient *Aquæ Flavie*, a town of the province of Trás-os-Montes. The fortifications which once defended it are now in ruins. It is situated on the Tamega River, here crossed by a Roman bridge, 12 arches of which remain out of the original 18, and has hot saline springs and baths. It has an interesting church, the burial place of Alfonso I., Duke of Braganza. Linen manufacture is carried on in the town. In 1811, after a violent conflict, Soult obtained possession of the place; and after the defeat of the Cartistas, 18 Sept. 1837, the famous Convention of Chaves was signed here. Pop. 7,500.

Chavica, kāv'i-ka, a genus of plants, of the natural order *Piperaceæ*, including the common long pepper, Java long pepper, and betel-pepper. The plants of this genus are shrubs very closely resembling those of the nearly allied genus *Piper*, and by some included in it. The leaves of the betel-pepper (*C.* or *P. betel*) form one of the ingredients of the masticatory called betel (q.v.).

Chay-root, chā-, or **Choy-root**, chōi-, the roots of a small cinchonaceous plant of Hindustan, the *Oldenlandia umbellata*, extensively cultivated on the Coromandel coast. The roots yield a dye which is used as madder.

Chayote, chī-ō'tā, a climbing vine (*Sechium edule* or *Chayota edulis*), belonging to the *Cucurbitaceæ*, or gourd family. The leaves are strongly three-angled or -lobed, with the broadly cordate base also showing two or four sharp corners. They are deeply concave, have a rough surface with whitish veins, and in color are of a deep fresh green. The pistillate flowers are solitary; the much more numerous staminate flowers are borne on special branches. Pollination takes place through the agency of insects. The ovary is always one-celled, with a single ovule. It is mealy-pubescent when young, becoming spiny with maturity in some varieties. The mature fruits are always more or less compressed, as though built over the large flat seed. In general they are pear-shaped, but vary in their proportions. They weigh from eight ounces to a pound each, and fruits weighing three pounds have been reported. In flavor they resemble summer squash or vegetable marrow.

The chayote is produced in large quantities in Porto Rico for domestic consumption, and it

CHAZARS — CHECK

has recently attained popularity in Australia and Algeria, from which latter country many hundreds of tons are annually shipped to Paris and London. It bears shipment well, an eight- or ten-day journey not affecting its condition. It is in common use as a vegetable in Madeira, Mexico, Central America, the West Indies, California, and Louisiana. It was first reported in Europe by Francisco Hernandez, who found the plant in Mexico about 1560, and described the fruit as suggesting the flavor of roasted oysters, sweet potatoes, or chestnuts. It produces tuberous roots which resemble the yam or cassava. In Mexico the young shoots are sometimes boiled and eaten like asparagus. Both the fruit and the vine are used as fodder for cattle and hogs, and the vines are sometimes used for fancy basket-work and the manufacture of women's hats. The flowers yield an abundance of nectar, and are said to be of value to bees. As an ornamental vine the chayote takes high rank, a single vine being reported as covering a fence 6 feet high and 50 feet long in a few months.

The fruit is eaten in a variety of ways,—boiled and seasoned with pepper and salt; par-boiled and fried; stuffed and baked; in puddings, tarts, or fritters, etc.

The name appears to be a form of the Aztec word *chayotl*, meaning "a head bristling with spines" or "a squash covered with thorns." The popular names are in many cases corruptions of the Aztec term, as the Porto Rican *layote*; but in the West Indies and Australia it is known as *chocho*; in Louisiana as *mirliton*; and as "vegetable pear" in some parts of the British West Indies.

Chazars, chā'zār, or **Khazars**, a people of the Finnic stock known in the 7th century on the shores of the Caspian; in the 9th century their kingdom occupied the southeast part of Russia from the Caspian and the Volga to the Dnieper. Their capital was long at Astrakhan, called by them Balandshar. They were singularly tolerant of all religions, Jewish, Christian, and Moslem; and a large part of the nation formally adopted the Jewish faith from Jews who fled from the persecutions of the Emperor Leo. It is not improbable that the modern Jews of Russia have at least an admixture of Chazar blood. Cyril converted many to Christianity in the 9th century. The power of the Chazars was broken in 965 by Sviatoslav. In the early part of the next century the destruction was completed by the Byzantine emperors and the Russians.

Chazy (shā-zē) **Stage**, in American geology, the limestone beds, 725 feet thick, typically developed at Chazy, N. Y. The name was first applied by the New York Geological Survey. The Grenville limestone of the Ottawa region in Canada corresponds to it. The Chazy limestone was laid down around the border of the old Pre-Cambrian land in Canada and New York in older Ordovician time. It succeeds the Califerous and is succeeded by the Trenton. Though a well-marked division in New York and Canada it is not determined farther west, but the St. Peter's sandstone, which underlies the Trenton limestone in Iowa, Michigan, and Wisconsin, may be of Chazy age. See **ORDOVICIAN**.

Che-Kiang, chē-kē-āng', or **Che-Chiang**, China, a maritime province lying north of

Fu-kian and south of Kiang-se and including the Chusan archipelago; area, 39,150 square miles. The province is of great commercial importance, containing three treaty ports, Ning-Po, Wan-Chau (Wen-Chow), and Hang-Chau (Hang-Chow) all of which are to be connected with Shanghai by a projected railway under British control. The surface is mountainous and traversed by rivers, notably the Tsien-Tang and Ta-Kia, which run down to the Eastern sea. The Grand Canal, which has its gateway in Che-Kiang, affords the only means of internal communication apart from an extensive system of narrow foot roads. Trade in silk and tea is well developed, this province being, with Chiang-Su and Fu-Shien, the first to contain a treaty port, that of Ning-Po, opened in 1844. Beside tea and silk the province produces cotton and sedge for hats and mats. It imports opium, cotton and woolen goods, tin and iron, kerosene oil, indigo and sugar. Coal is found in the north and iron ore in the south.

Che-Kiang is famed for its native system of education. It contains the great religious and literary centre of China, Hang-Chow (not to be confused with Hang-Kow or Han-Kow), where thousands of candidates yearly resort for the public examinations. Hang-Chow is also the capital of the province, which is ruled by a viceroy. Marco Polo visited Che-Kiang in the 14th century, when it contained beautiful temples, now in ruins. The most magnificent architectural feature of the province is the temple of the Queen of Heaven, dating from 1680. Che-Kiang suffered severely during the Tai-ping rebellion in 1861. The Italians in 1900 laid claim to part of Che-Kiang as a sphere of influence, and demanded the privilege of establishing a port on the coast to be called San Mun. There are thousands of native Christians. The last census (1882) gave a population of 11,588,692. The population in 1900 was estimated at 15,000,000. The foreign population is estimated (1900) at 2,750.

Cheap'side (M. E. *chepe*, market) a thoroughfare of London, running east and west through a part of the city that was in former times a large, open common. In the Middle Ages Chepe was the chief seat of the London retail trade.

Cheat. See **BROME GRASS**.

Cheat River, a river rising in the Alleghanies in West Virginia, and after the union of its four forks, flowing north and then northwest to empty into the Monongahela a few miles beyond the boundary line of Pennsylvania. Its length is about 150 miles.

Cheboygan, Mich., city and county-seat of Cheboygan County, on Lake Huron, and on the Michigan Central and the Detroit & M. R.R.'s, at the eastern end of the Straits of Mackinaw. It became a city in 1886 and is governed by a board of 10 aldermen. It is an agricultural centre, a popular summer resort, and manufactures lumber, paper, leather, and furniture. It has nine churches and an excellent public school system. Pop. (1900) 6,489.

Check, or **Cheque**, a draft or bill on a bank, payable on presentation. A check may be drawn payable to the bearer, or to the order of someone named; the first form is transferable

CHECKERBERRY — CHEE-FOO

without endorsement and payable to any one who presents it; the second must be endorsed, that is the person in whose favor it is drawn must write his name on the back of it. Checks are a very important species of mercantile currency wherever there is a well-organized system of banking. The regular use of them for all payments, except of small amount, makes the transfer of funds a mere matter of cross-entries and transferring of balances among bankers, and tends greatly to economize the use of the precious metals as a currency.

Check'erberry. See GAULTHERIA; PARTRIDGE BERRY.

Checkers, Chequers, or Draughts, a game of skill played by two persons with a checkered board divided into 64 squares, which are alternately colored black and white or black and red, and with 24 small disks of wood or bone technically termed "men," 12 being usually colored black, and the others white or red. At the beginning of the game each player places his men on alternate squares (of the color agreed on) of the first three rows of his side of the board, which is so placed between the two players that each one has at his right hand one diagonal line of two squares of the color chosen to play on (the rule being technically known as "double corners at the right hand"). This leaves the two middle rows of the board unoccupied. The privilege of the first move is determined by lot or in any manner agreed upon; after the first game of a series the first move passes alternately.

The first player advances any one man in his foremost row one square diagonally; his opponent likewise moves a man; and so on alternately until one player exposes a man to capture by leaving a vacant space behind him on a diagonal line on which stands next him a man of the opponent. Capture is effected by the leaping of such "enemy" over the man so exposed and occupying the vacant space, on which the man so taken is removed from the board. For failure to seize the opportunity to take a man prisoner, the opponent may compel the capture of the piece, or he may remove the delinquent from the board,—an operation known as "huffing." (Under certain rules of the game, the "huff" carried with it the privilege of the next move. This is not in common use at the present day. The player who first puts out of action all his opponent's men wins the game. Putting out of action may be accomplished either by capture or by so hemming in the opponent's men that they cannot move. If a player succeeds in getting a man across the whole board into the enemy's rear line of squares, it thereby becomes a "king," with the privilege of moving diagonally in either a backward or forward direction. A "king" is usually distinguished or "crowned" by placing a disk of the same color on its top. More than one man can be captured at a time if they stand in such order on the board that the series consists of a man and a vacant square alternately, and this series may be in a straight diagonal, or in any branching diagonal therefrom, provided the progress of the capturing man be never retrograde,—always toward the king line.

Checkers is a very ancient game. A form of it, of great antiquity in China, is known by the appropriate name of "the game of circum-

vention." It was well known by the Egyptians, Greeks, and Romans, and antiquarians have recognized it as one of the games indulged in by the, practically, recently discovered New Zealanders, who for thousands of years must have been cut off from all Asiatic or European influences. The first English publication relating to it was published in 1566, but the most important early book was Waller's, published in Paris in 1668. The leading authority is Joshua Sturgis, 'Guide to the Game of Draughts.'

For laws, hints, and diagrams of the American game, as well as for references to the Polish and Spanish varieties, see A. Howard Cady, 'Checkers, a Treatise on the Game.'

Cheddar, chēd dēr, England, a village in Somerset County, at the foot of the Mendip Hills, 18 miles southwest of Bristol. The dairies in the neighborhood have long been famous for the excellence of their cheese, which is made from the whole milk, and the whey skimmed off, heated, and added to the curd. Pop. about 2,000.

Cheddar Cheese. See CHEESE.

Chedorlaomer, kēd-ōr-lā-ō'mēr, a king of Elam, mentioned in the 10th chapter of Genesis as one of the confederates of Tidal, "King of Nations," in the expedition against the king of Sodom and other rebellious tributaries. See ABRAHAM.

Cheduba, chē-doo'ba or chēd'oo-ba, or **Man-aung,** Burma, an island in the Bay of Bengal, about 25 miles off the coast of Aracan, forming a township of Kyauk-pyu district; area, 240 square miles. On the island is a town of the same name. Cheduba is well wooded and fertile, but unhealthy. On the northwest coast inflammable gasses are discharged in some quantity. The principal product is an excellent tobacco. Rice, indigo, pepper, are also produced; and petroleum is found. Pop. 24,000.

Chee-foo, chē-foo', or **Chafoo** (properly the name of the European colony of the Chinese town of Yen-Tai), a treaty port on the north side of the peninsula of Shan-tung, at the entrance to the Gulf of Pechili, in which it is the only port that remains open throughout the winter. The foreign quarter is in some sense a colony of Shanghai, and, having the best climate of all the treaty ports, it is much resorted to by convalescents. The Chinese town has fortifications and a signal-station. As a market for foreign manufactured goods, particularly English cotton yarn and American sheetings, Chee-foo is of great importance. The other principal articles of import are sugar, paper, iron, edible seaweed, matches, and opium. The chief exports are silk, straw-braid, bean-cake, beans, and vermicelli. The Chee-foo Convention, which settled several disputed points between China and Great Britain, and extended certain commercial advantages to the latter country, besides throwing open four new treaty ports, was signed 13 Sept. 1876. Since then the "open door" policy of the United States has tended to widen the relations of this port with the rest of the commercial world. In 1899 American merchandise found a market in Chee-foo to the extent of over \$3,000,000. The port was the scene of a naval demonstration in 1900, when British and American warships threatened to bombard the forts if their hostile attitude was

CHEECHA—CHEESE AND CHEESE-MAKING

not abandoned. There were 150 missionaries in the city, whose rescue from peril was thus effected. Pop. about 32,000.

Cheecha, chē'chā. See GECKO.

Cheer'yble Brothers, two merchants introduced in Charles Dickens' novel 'Nicholas Nickleby.' They are twin brothers of a very genial and liberal disposition and become staunch friends of the hero. It is said that the novelist reproduced in these characters two cotton-spinners of Manchester.

Cheese and Cheese-making. Cheese is the curd of milk, including principally the casein and fat, coagulated, cooked, drained, and pressed into solid form. Nearly all cheese is made from cows' milk, and originally it was a product of the farm. Now by far the greater portion is made in factories especially fitted for the purpose. The standard factory-made American cheese is practically identical with the English Cheddar cheese, and is often so called.

In the manufacture of cheese a milk rich in fat is preferred, the cheese being nearly all fat and casein. By artificial souring of the milk coagulation is produced, so that the whey or watery part may be separated from the curd. The curd is the raw material operated on; the casein is a proteid substance that may be compared to lean meat, and is coagulated by acid. It is that part of the curd that remains when the fat, sugar, and ash are extracted. The first process of manufacture is to heat the milk (preferably sweet milk) to about 84° F. It is then tested with rennet for ripeness. A graduated cup provided with a fine hole in the bottom is filled with milk and a little rennet added. Rennet, in its commercial form, is a preserved extract from the fourth stomach of a calf. Being of a peptic character it tends to coagulate the milk, and if the milk in the cup coagulates in from 17 to 20 seconds it is sufficiently ripe for treatment. Enough rennet is then added to the supply of milk to coagulate the whole in 25 or 30 minutes. The proportions vary with conditions, but about four ounces of rennet extract to 100 gallons of milk is perhaps an average quantity. When the milk is coagulated, the solid portion or curd in the vat is separated from the watery portion, by allowing the latter to drain off. This waste usually becomes food for pigs. Gang knives are then brought into use, to cut the curd into cubes of a third of an inch or more, the knives being set a little less than half an inch apart and passed through the curd horizontally and perpendicularly. After cutting, the curd is gently agitated to prevent settling. This allows the curd to shrink, and tends to expel a portion of the whey. The stirring may be done with a curd-rake, but factories more commonly employ what is termed an automatic curd-agitator, which is attached to the vat and driven by steam power.

The mass of curd is next heated very slowly to about 92° F. This cooking process may continue several hours, lasting until the operator finds that the curd will string about a quarter to a third of an inch on a hot iron. The whey is then drawn off. The curd is next turned and piled, to rid it of the excess of moisture. When deemed sufficiently solid it is ground and salted. The grinding may be done in one of several kinds of mills, a common form having

two cylinders with teeth rotating toward each other, which operation picks the curd to pieces.

After grinding, the curd—or cheese, as it may now be called,—is dipped and put into hoops to give it form for pressing. Common sizes of hoops are 14½ × 10 and 13½ × 6 inches. An iron bandage or rim is placed about the hoop to give it solidity, and a cloth wrapped about it to keep the cheese together and secure cleanliness. Pressure is then applied, at first lightly, and then increased, the cheese being usually turned over during the operation. The pressure is maintained for 16 to 18 hours, after which the cheese is ready to be cured.

Curing-rooms are built both above and below ground, the latter being preferred as being easier to maintain at a cool temperature. High temperature is very deleterious to cheese, diminishing its value by melting and leaking of fat, while the texture and flavor are also impaired. A temperature below 65° F. should always be maintained in the curing-room, and 40° is better. Ventilation must be provided, and the usual arrangement is an upright draft-pipe, run high enough to catch the wind, and with a vane at the top to turn the mouth of the funnel to the wind. The process called ripening takes place in the curing-room, determining the particular flavor of the cheese. The ripening is caused by bacteria, as is proven by making cheese from sterilized milk, in which case it retains the flavor of new-made cheese for a very long period. Dairy bacteriologists are endeavoring to isolate the different species of cheese bacteria, that they may be cultured, and incorporated with the milk in starting the cheese-making. In this way the maker would be certain of securing a particular flavor for his cheese, whereas now it is a matter largely of chance as to what bacteria predominate.

The method described above is that followed in practically all the factories of the United States and Canada. More than four fifths of the cheese manufactured is of this character. The remainder is farm-made, or made in urban dairies, or else is manufactured by some other process in imitation of some foreign cheese, as the Swiss Gruyère or Emmenthal, Limburger, Neuchâtel, Brie, etc.

The constituents of milk which determine its value for cheese-making are the fat and casein. Milk may contain from three to eight per cent of fat and from two to five per cent of casein, the average proportion being about a pound of fat to two thirds of a pound of casein. Since the cheese yield increases with the fat in the milk, managers of cheese factories have encouraged the production of milk rich in fat, and perhaps this knowledge is largely responsible for the fact that in 1900, in the factories of the United States, 100 pounds of milk made almost 17 per cent more cheese than it did in 1890.

The analysis of cheese is largely a matter of securing a correct average, as a cheese varies in properties at the centre or at the circumference. A wedge is generally taken as a sample, cut from the centre to the rind, or sometimes a plug, taken at one third the distance from the rind to the centre. The usual test of cheese is to find the proportion of fat. For this purpose the Association of Official Agricultural Chemists of the United States Department of Agriculture have adopted the following method:

CHEESE-FLY — CHEETA

For the estimation of fat in cheese about 5 grams should be carefully weighed, and transferred as completely as possible to a test bottle. From 12 to 15 c.c. of hot water are then added and the bottle shaken at intervals, keeping it warm until the cheese has become softened and converted into a creamy emulsion. This may be greatly facilitated by the addition of a few drops of strong ammonia to the contents of the bottle. After the contents of the bottle have become cold the usual amount of acid should be added and the bottle shaken until the lumps of cheese have entirely dissolved. The bottles are then placed in the machine and whirled, the test being completed in the same manner as with milk. To obtain the percentage of fat the reading should be multiplied by 18 and divided by the weight in grams of cheese taken.

Some cheese is colored by the makers, though the best requires no coloring. Saffron and annatto are used for this purpose. Various herbs are also incorporated with the milk at the time of making the curd, to alter the appearance or flavor of the cheese. Common among these are sage leaves, marigold, and parsley.

A small proportion of the cheese used in the United States is imported. From 5,000,000 to 7,000,000 pounds a year of Swiss cheese are brought in, also some from France, Germany, and England. Such cheese is usually named from the locality whence it comes, though sometimes the name becomes distinctive of a special make, as the Roquefort, which is made from the milk of sheep, mainly the Larzac breed; the Kachkaval (Bulgarian), a white cheese made of sheep's milk; the Parmesan (Italian), which is kept three or four years and polished with linseed oil and charcoal till it shines like ebony; the Limburger (German), characterized by its strong odor; and the Brie (French), which is also odoriferous.

In 1900 there were 3,299 cheese factories in the United States, and 571 factories making both butter and cheese. New York and Wisconsin are the greatest cheese-producing States, their aggregate product being over two thirds the total of the whole country. In 1900 the 1,314 cheese factories of New York produced 127,795,195 pounds, and the 1,286 factories of Wisconsin 77,748,680 pounds. Ohio has 320 factories; Pennsylvania, 140; Michigan, 136; Illinois, 123; Iowa, 89; Vermont, 71; Minnesota, 53, while no other State has as many as 40. The total factory product of the whole United States in 1900 was 281,972,324 pounds; to this should be added 16,372,330 pounds made on farms, and 662,164 made in urban dairies, making a total cheese product for the year of 299,006,816 pounds. Valued at 10 cents a pound, which is an average wholesale price, it was worth nearly \$30,000,000.

Previous to 1850 practically all the cheese made in this country was a farm product. During the period from 1850 to 1860 factories were established in New York State at the rate of three or four a year, and from the latter date the growth of the industry in New York was rapid, as follows: 1860, 17 new factories; 1861, 18 more; 1862, 25; 1863, 111; 1864, 210; 1865, 52; 1866, 46. Since that date the growth has been a normal one. A comparison of census figures for 1890 and 1900 affords a fair idea of the development. In 1890 the milk consumed by the factories of the United States amounted to 2,684,550,517 pounds, and in 1900 it was 2,741,898,114, an increase of only 2.1 per cent. The cheese made from this milk, however, showed a gain in quantity of 18.5 per

cent, the product of 1890 being 238,035,065 pounds, against 281,972,324 for 1900. The cost of production increased more than the product, being 30.3 per cent, or \$16,320,590 for 1890, and \$21,258,712 for 1900. The value of the cheese product for the years named showed the greatest increase in percentage, namely, 33.9, the totals being \$19,802,957 for 1890, and \$26,519,829 for 1900.

The average cheese factory product, as shown by the United States census of 1900 is 72,842 pounds, representing about 730,000 pounds of milk, from about 290 cows. The milk from 1,130,000 cows for a little more than half the year supplies the total for the factories of the country.

During the decade from 1890 to 1900 only three States showed an increase in the farm-made cheese product,—Wisconsin, Pennsylvania, and California. The latter State produced 4,249,388 pounds of farm-made cheese in 1900, as against 2,676,543 pounds of factory make.

Cheese is lower in price during the summer months than at other seasons. Following are the wholesale quotations during the year 1901:

MONTH	New York		Cincinnati		Chicago		St. Louis	
	high	low	high	low	high	low	high	low

For further information regarding cheese see the United States Census reports, and reports of the New York State Agricultural Experiment Station and the Wisconsin Agricultural Experiment Station; also the year-books of the Department of Agriculture.

CHAS. H. COCHRANE.

Cheese-fly, a small, black, dipterous insect (*Piophilæ casei*) bred in cheese, of the same family to which the house-fly, blow-fly, etc., belong. It has a very extensible ovipositor, which it can sink to a great depth in the cracks of cheese, and lay its eggs there. The maggot, well known as the cheese-hopper, is furnished with two horny claw-shaped mandibles, which it uses both for digging into the cheese and for moving itself, having no feet. Its leaps are performed by a jerk, first bringing itself into a circular attitude, when it can project itself 20 to 30 times its own length.

Cheese-hopper. See **CHEESE-FLY**.

Cheese-rennet. See **BEDSTRAW**.

Cheeta, **Cheta**, **Cheetah**, or **Hunting-Leopard**, a large tropical cat (*Cynelurus jubata*) forming an offshoot of the *Felidæ*. Its length and slenderness of limb give it a fleetness in running short distances, such as is probably attained by no other large mammal. Its claws are short, blunt, and practically non-

CHEEVER — CHELAN LAKE

retractile. It pursues its prey by chase rather than by stealth; and ordinarily exhibits more dog-like than cat-like qualities, among these being great docility. It can, however, stealthily come upon its prey if occasion demands. It is about the length of a leopard, but stands much higher, is rufous or tawny in color, spotted with black, except on the throat. It is commonest in the African jungles, and thence is more sparsely distributed to India. In India it is tamed and trained by the natives as a hunter. It is treated like a falcon, leashed, hooded, and kept blindfolded until the game is in sight, when it is loosed and darts upon the quarry, which it drags down and holds until the huntsman comes. The ancient monuments show that this leopard was employed by the Assyrian and Egyptian sportsmen of remote antiquity; and it is known that in the 14th century the returning Crusaders introduced the cheeta into Europe where it was used for some centuries.

Cheever, Ezekiel, American school teacher: b. London, Eng., 25 Jan. 1614; d. Boston, Mass., 21 Aug. 1708. He received a good classical education and emigrated to America in June 1637, in order to enjoy religious freedom. With Davenport and Eaton he was one of the founders of New Haven, Conn., where he married and taught school in his own house, Michael Wigglesworth being one of his pupils. About 1650 he removed to Ipswich, Mass., where he was the first master of its Free, or Grammar School; in 1661 he went to Charlestown in a similar capacity, and in 1670 was called to Boston as head master of its free school, and remained there the rest of his life. His 'Latin Accidence: an Elementary Grammar of the Latin Language,' was for a century the most popular introductory Latin text-book used in New England, 18 editions having been printed before the Revolution (10th ed. 1767; 20th ed. Salem 1785). He also wrote 'Scripture Prophecies Explained, in Three Short Essays,' an edition of which was printed at Boston 1757. His funeral sermon was preached by his pupil and friend, Cotton Mather.

Cheever, George Barrell, American clergyman: b. Hallowell, Me., 17 April 1807; d. Englewood, N. J., 1 Oct. 1890. He was editor of the New York 'Evangelist' from 1845 to 1846, and at different times connected with the New York 'Observer' and 'Independent.' He was an able and vigorous writer and speaker, and the author of a large number of works in prose and verse. Among his publications are: 'Studies in Poetry' (1830); 'God's Hand in America' (1841); 'Poets of America' (1847); 'Windings of the River of the Water of Life' (1849); 'The Voice of Nature to Her Foster-Child, the Soul of Man' (1852); 'Lectures on the Life, Genius, and Insanity of Cowper' (1856), arguing that Cowper's religious terrors proved him sane instead of insane; and 'God Against Slavery, and the Freedom and Duty of the Pulpit to Rebuke It' (1857). One of his most effective works was 'Deacon Giles' Distillery.'

Cheever, Henry Theodore, American prose writer and clergyman, brother of the preceding: b. Hallowell, Me., 6 Feb. 1814; d. Worcester, Mass., 13 Feb. 1897. His writings were popular, and include: 'The Island World of the Pacific' (1852); 'Short Yarns for Long

Voyages' (1855); and 'Correspondences of Faith and Views of Madame Guyon' (1886).

Chehalis (chē-hā'lis) **River**, Washington, in the southwestern part of the State. It has its rise in Lewis County, flows north-northwest and through Chehalis County, into Gray's Harbor. Its length is 125 miles, and is navigable for light steamers some distance from the mouth.

Cheilognatha, or **Chilognatha**, kī-lōg'na-tha, one of the two orders of *Myriapoda*, including the millipeds and other forms. See MYRIAPODA.

Cheilopoda, or **Chilopoda**, kī-lōp'ō-da, one of the two orders of *Myriapoda*, represented by the centipeds. See MYRIAPODA.

Cheiromancy, or **Chiromancy**, kī-rō-mān-sī. See PALMISTRY.

Cheiromys, kī-rō'mīs. See AYE-AYE.

Cheiroptera, an order of mammals, the bats, closely related to the insectivores, and characterized by the immense extension of the forelimbs so as to form wings, and by other adaptations of the skeleton for an aerial life. The order is divided into two groups: *Mega-chiroptera* and *Microchiroptera*. The former consists wholly of the great fruit-eating bats of the Old World tropics; the latter contains all the remaining families. They are separated principally by dental features. See also BATS.

Cheirotherium, kī-rō-thē'ri-ūm. See LABYRINTHODONTA.

Cheke, chēk, **Sir John**, English scholar: b. Cambridge 16 June 1514; d. London 13 Sept. 1557. He was educated at St. John's College, Cambridge, and made regius professor of Greek. In 1544 he was appointed tutor to the future Edward VI., and appears likewise to have assisted in the education of the Princess Elizabeth. On the accession of Edward he was knighted, became secretary of state in 1553, and was also a privy-councillor. On the king's death he supported Lady Jane Grey, and was committed to the Tower. After a few months, however, he was set at liberty and settled in Strasburg; but his connection with the English Protestant Church there gave offense to the Roman Catholics in England, and his estates were confiscated. He supported himself by teaching Greek, but in 1556, having been induced to visit Brussels, he was arrested by order of Philip II. and sent prisoner to England. Under threat of the stake he recanted, and received the equivalent of his forfeited estates. His chief distinction was the impulse given by him to the study of Greek.

Chel-ab-ku-kil, or **Ab-ku-kil-chel**, an Indian priest of Yucatan who flourished in the 15th century. His name is mentioned in almost every Yucatanic legend, and fragments of history composed by him are found in documents of the missions of Yucatan and Central America.

Chelan (chē'lān) **Lake**, Washington, in the mountains of Okanogan County, 70 miles long, about 3 miles wide, and the largest lake in the Northwest. Its chief inlet is Stehekin or Pierce River, on which, about three miles distant from the lakes, are the famous Rainbow Falls, 300 feet high. The outlet is Columbia River. Chelan, Moore, Stehekin, and Johns, towns on its banks, are summer resorts.

CHELARD — CHELONIA

Chelard, shē-lār, **Hippolyte André Jean Baptiste**, French musician and composer: b. Paris 1 Feb. 1789; d. Weimar, Germany, 12 Feb. 1861. After studying in the various musical centres of Europe, he brought out his first comic opera, 'Casa da Vendere,' in Naples in 1815. In 1816 he settled in Paris as a teacher of music and violinist. In 1827 his lyrical opera, 'Macbeth' (with words by Rouget de Lisle) was very successful, and procured for him the place of chapel master to the king of Bavaria. He produced other operas, cantatas, etc.

Chelléan, shēl-lā-ān, this name is given by French archaeologists to certain leaf-shaped flint implements found near Chelles in the department of Seine-et-Marne, and supposed to be the oldest relics of prehistoric man in Europe. The name is also given to the epoch, early Pleistocene, in which the makers, who were of the Neanderthal, lived. The climate then was warmer and more moist than now, so much so that the hippopotamus and rhinoceros inhabited Europe. It is impossible to say what was the equivalent of the Chelléan epoch in the United States, though, perhaps, it was equivalent to one of the earlier retreats of the continental ice sheet in the glacial period. See GLACIAL PERIOD; MAN; PLEISTOCENE.

Chelles, Jean de, zhōn dè shēl, French architect and sculptor of the 13th century. He is best known for his work on the southern portal of Notre Dame in Paris. This beautiful entrance remains as it was constructed in 1257.

Chelmonski, chēl-mōn'skē, **Joseph**, Russian painter: b. Varsovia. He studied in Paris under Gerson, and has made a reputation by his landscapes and figures.

Chelmsford, chēmz'ferd, **Frederic Augustus Thesiger**, 2D BARON, English general. b. 31 May 1827. Entering the army in 1844, he served in the Crimea and through the Indian mutiny. As deputy adjutant-general he served in the Abyssinian campaign, was made aide-de-camp to her Majesty, and adjutant-general to the forces in India (1868-76), and in 1877 was appointed commander of the forces and lieutenant-governor of Cape Colony. He restored Kaffraria to tranquillity, and was given the chief command in the Zulu war of 1879. After great difficulties with the transport, and some disasters, such as those of Isandhlwana and Intombi, he gained the decisive victory of Ulundi on 4 July, before the arrival of Sir Garnet Wolseley, who had been sent to supersede him. On his return to England he became lieutenant of the Tower, a post which he held till 1889. He was promoted to the rank of lieutenant-general in 1882, and in 1888 was created a general. In 1893 he went on the retired list.

Chelmsford, England, a municipal borough and capital of the county of Essex, 29 miles northeast of London, situated at the confluence of the Chelmer and Cann. There is a good municipal water supply, and the streets are lighted by electricity. The church of St. Mary is a fine old building of the 14th or 15th century. Among the public buildings are the corn-exchange and the shire-hall containing the courts of assize. There are manufactories of agricultural implements, electric lighting, and wireless telegraphy works; and a considerable trade in corn and malt is carried on. On the banks of

the Chelmer are several large flour-mills. The town gives name to a parliamentary division of the county. The Romans had a station on the site of Chelmsford, and Roman remains have been found in the neighborhood. Pop. (1901) 12,580.

Chelone, kē-lō'nē, in Grecian mythology, a nymph who, having failed to be present at the marriage of Zeus and Hera, and having ridiculed their nuptials, was plunged with her house by Hermes into the river on whose banks she dwelt, changed into a tortoise, and thus condemned for ever to carry her house upon her back.

Chelonia, ke-lō'nī-ā, or **Testudinata**, tēs-tū-dī-nā'ta, an order or sub-class of *Reptilia* (q.v.) containing the turtles and tortoises, and one of the most sharply defined groups of vertebrates. The body is enclosed in a more or less well developed bony box, from which the head, neck, tail, and two pairs of limbs protrude, and into which they may be completely retracted in some tortoises and terrapins. This box is a unique feature among reptiles and is divided into a dorsal shield or carapace composed of numerous dermal bones usually arranged regularly and supported on the ribs and vertebral spines, and a ventral shield or plastron likewise composed of dermal bones, among which are incorporated the clavicles and interclavicle. Both carapace and plastron are usually encased in horny plates, which do not correspond to the bony pieces. Except for the head and neck, which are flexible, the vertebrae are immovably ankylosed with the carapace. The skull is very compact, with a small brain cavity, and exhibits many structural peculiarities, of which two of the most apparent are the complete fixation of the quadrate bone, and the substitution of horny cutting plates for teeth on the margins of the jaws. Both shoulder and pelvic girdles are permanently enclosed within the shell, and the latter is often firmly united to both carapace and plastron. The limbs may be flattened paddles in the sea turtles, or true walking legs with free toes in the other groups. All chelonians have well developed lungs; but some aquatic forms have additional respiratory organs in the form of vascular areas and papillae in the pharynx and oesophagus. Without any known exceptions, they are oviparous, and, after burying the eggs in the earth, allow them to be hatched by the warmth of the sun. Except in the colder regions turtles are found throughout the world, and are mostly inhabitants of fresh water, though a considerable number are terrestrial and a few marine. Between 200 and 300 living, and a great many extinct species are known, many of the latter belonging to families not represented in the recent fauna. The chelonia are divided into four sub-orders:

1. *Atheca*, in which the carapace is of leathery consistency and is supported by numerous small, irregular, separate bones free from the ribs. There is one family (*Dermatochelydidae*), containing the leather-turtle (q.v.).

2. *Trionychoidea*, with a true carapace composed of dermal bones united to the ribs, but covered by a leathery skin, and lacking the marginal bones; the pelvis is free from the plastron. There is one family (*Trionychidae*), the soft-shelled turtles (q.v.).

CHELSEA — CHEMICAL AFFINITY

3. *Cryptodira*, in which the carapace is covered with horny plates and provided with marginal bones, and the pelvis is free from the plastron. It embraces the following families: *Chelonida*, including marine turtles, as the green, loggerhead and tortoise-shell turtles (qq.v.); *Testudinida*, land-tortoises and gopher tortoise (qq.v.); *Chelydrida*, snapping-turtles and alligator-turtles (qq.v.); *Cinosternida*, terrapins and box-turtles (qq.v.); and several others confined to the tropics of both hemispheres.

4. *Pleurodira*, in which the carapace is similar to that of the *Cryptodira*, but the pelvis is ankylosed to the plastron, and the neck folds in a horizontal instead of a vertical plane. They are all inhabitants of fresh waters in the tropical parts of both the Old and New Worlds. Representative families are the *Pelomedusida*, tartaruga (q.v.) and *Chelydrida*, matamata (q.v.).

Consult Gadow, 'Amphibia and Reptiles,' and Baur, in a bulletin of the United States National Museum.

Chelsea, chěl'sē, England, a parliamentary borough in Middlesex and western suburb of London, on the north side of the Thames, chiefly distinguished for containing a royal military hospital. A building was originally commenced here by James I. as a theological college, but was never finished. In the reign of Charles II. the erection of the present hospital for sick, maimed, and superannuated soldiers was begun. It was carried on during the reign of King James II., and finished in that of William and Mary by Sir Christopher Wren, in 1692. The whole expense of this structure amounted to £150,000, and the extent of the grounds is now about 66 acres. The pensioners maintained here number about 550, and consist of soldiers maimed or disabled in the military service, or who have served for 21 years. All pensions are granted by the commissioners of Chelsea Hospital, but most of the recipients are known as out-pensioners. Their number amounts to about 80,000. It is from them that the in-pensioners are selected. Not far from the hospital is a royal military asylum for the education and maintenance of the children of soldiers. George Eliot, Dante, Rossetti, and Carlyle were once residents of this borough. Carlyle is known as "the Sage of Chelsea." Pop. (1901) 93,841.

Chelsea, Mass., a city of Suffolk County, separated from East Boston by Chelsea Creek, and from Charlestown by the Mystic River. It is a suburb of Boston, and is connected with it by ferries, electric, and steam railroads; and the Mystic River is crossed here by a bridge 3,000 feet long. Chelsea has a United States Marine Hospital, United States naval powder magazine, Soldiers' Home, Fitz Public Library, and Odd Fellows' and Masonic halls. It has extensive manufactories of rubber goods, foundry and machine-shop products, leather, cordage, brass goods, pottery, iron and steel, etc. In 1900 there were 308 manufacturing establishments, with \$8,211,682 capital and 3,332 hands and an annual output valued at \$10,333,549. It has numerous churches, high and graded public schools, weekly newspapers, two national banks, and an assessed property valuation of over \$23,000,000. Chelsea was settled at Winnisimmet in 1630; was a part of Boston until it was organized as a town in 1738, and was incorporated as a city in 1857. Pop. (1900) 34,072.

Chelsea Hospital. See **CHELSEA**.

Chelsea Village, now a part of New York. The name is still preserved in Chelsea Square between Ninth and Tenth Avenues and Twentieth and Seventy-first Streets. Clement C. Moore, the author of "Twas the Night Before Christmas," owned here a farm in the early part of the last century. He sold it off in lots, and the place was called Chelsea Village.

Cheltenham, chěl'ten-am, England, a municipal and parliamentary borough, and popular watering-place, in the county of Gloucester, seven miles northeast of the city of Gloucester, on the river Chelt, a short tributary of the Severn, 120 miles from London by rail. It is a city of gardens, protected by hills, and surrounded with beautiful scenery. Cheltenham spas first occasioned the rapid growth of the town, but the baths and springs are less frequented than formerly. The springs were discovered in 1716 by accident, but became famous in 1788 through a visit paid to them by George III. The parish church is a fine old Gothic structure, and the Roman Catholic and Congregational churches are two of the finest in England. The town is an educational centre. There is a college for boys (founded in 1843), with an attendance of 700 scholars; and the ladies' college, with 500 pupils. There are also two training colleges for teachers. Among the other public institutions may be mentioned its libraries, assembly rooms, the college museum, pump-rooms, theatre, and numerous places of fashionable resort. There are hospitals, orphanages, etc. Cheltenham returns one member to Parliament. The town has a large brewery and ironworks. Pop. parliamentary borough (1901) 52,858; municipal borough 49,439.

Chelyuskin, chěl-yoos'kín, Cape (formerly Northeast Cape, and sometimes called Cape Severo), the extreme northern point of Asia, on a peninsula of the same name, which forms the western arm of the eastern half of the Taimyr Peninsula. It is named after a Russian officer who led an expedition thus far in 1742, and here succumbed, with his wife, to the fatigues of the journey; it was not revisited till 1878, when Nordenskiöld, in the Vega, spent 19 and 20 August here. Lat of the west is 77° 36' 37" N., that of the east 77° 41' N.

Chemical Affinity, the force which causes two or more dissimilar substances to combine in definite proportions to form a new substance, whose properties are distinct from those of any of the constituents. The word "affinity" was originally employed in this sense because it was believed that a kind of relationship exists between substances that are capable of combining with one another. No such idea as this is entertained in modern times, and it might even be said that the tendency toward combination is (in general) stronger, in proportion to the dissimilarity, or lack of obvious relationship, between the substances combining. In the time of Aristotle the constituent particles of bodies were conceived to be endowed with qualities somewhat akin to love and hate. After the advent of Galileo, these notions were exchanged for equally erroneous but more mechanical ones, and the ultimate particles were represented, in thought, as provided with hooks and other similar devices, by means of which their com-

CHEMICAL ANALYSIS

binations were conceived to be effected. Later, when the law of universal gravitation was propounded by Newton, the force impelling the atoms toward one another, and holding them in their combinations, was naturally enough pictured as a special form, or manifestation, of gravitative action. This latter view may possibly be true, but if so we must modify our present views with regard to gravitation somewhat, and assume that it follows different laws, when acting at molecular distances, from what it does when acting at distances that are appreciable to the senses. The modern tendency appears to be rather in favor of viewing chemical affinity as an electrical manifestation, though no really defensible, intelligible, and definite form has yet been given to this notion.

It was formerly thought possible to arrange the elements in the order of their chemical affinity, so that each element in the array would expel all those that preceded it from their combinations, and tables of this sort were published nearly two centuries ago (in 1718) by Geoffroy. Later, it was found that no such definite law exists; and Claude Louis Berthollet, in his famous 'Essai de Statique Chimique' (Paris, 1803), pointed out that the combination of substances depends not only upon the affinity that such substances have for each other, but also upon the relative quantities in which they are present. For example, if barium sulphate and potassium carbonate are melted together, the former is always partially converted into carbonate; but in order to effect its total conversion into carbonate, it is necessary that the quantity of carbonate of potassium present shall be at least six or seven times as great as the equation $\text{BaSO}_4 + \text{K}_2\text{CO}_3 = \text{BaCO}_3 + \text{K}_2\text{SO}_4$ would appear to require. In recent times the necessity of taking account of the relative masses of the combining substances has been fully recognized, and a good idea of the important results that have followed may be had from Nernst's 'Theoretical Chemistry from the Standpoint of Avogadro's Rule and Thermodynamics' (translated into English by Prof. C. S. Palmer). Numerical estimates of the "affinity" of various substances have been obtained by many methods, but the results are not always in as good accord with one another as could be wished, and a discussion of the differences would require a volume. For a brief but excellent review of the different methods consult W. C. D. Whetham, 'Solution and Electrolysis,' See DISSOCIATION; EQUILIBRIUM (Chemical), and SOLUTION.

Chemical Analysis is the art of determining the constituents of which a given substance is composed. The analysis is "qualitative" if it is made solely for the purpose of discovering what those constituents are. It is "quantitative" if the object is to ascertain the quantity of each that is present. It is hardly necessary to say that in the examination of an unknown substance a qualitative analysis must be made before a quantitative examination is attempted, because the methods that must be employed in quantitative work depend altogether upon the nature of the constituents that are to be determined. An analysis is said to be "ultimate" when its object is merely to discover what elements are present, and in what quantity each occurs. It is said to be "proximate" when it is made for the purpose of learning how these

elements are combined with each other, and what radicals or other proximate constituents are present. General methods are known, which suffice for the ultimate analysis of any compound that may be proposed; but chemical science has not yet been developed sufficiently to formulate equally general methods for proximate analyses. Methods are indeed known for the recognition of certain of the organic radicals, but most of the problems that arise in proximate analyses are of such a nature that special means must be devised to fit each special case.

QUALITATIVE ANALYSIS OF INORGANIC SUBSTANCES.

In the qualitative analysis of inorganic substances, the color that the proposed compound communicates to the flame of a Bunsen burner often affords useful information as to the nature of the compound, and a systematic examination of the substance in the flame of the blowpipe may afford much additional information. (See BLOWPIPE ANALYSIS.) When the substance is partially volatilized in the flame of the Bunsen burner, or by the electric spark from an induction coil, and the light of the flame (or the spark) is examined through the spectroscope, many of the elements can be recognized, even when present in exceedingly small quantities, by the occurrence, in the spectrum, of certain characteristic bright lines, or groups of such lines. (See SPECTROSCOPE.) The usual method employed, however, for the detection of the commoner bases and acids, is known as the "wet process," and consists in bringing the substance into solution, and noting the behavior of this solution when certain reagents are added to it. Even in the analysis of inorganic substances (which are alone considered in the present section) troublesome combinations sometimes occur, and in such cases the reaction that might naturally be expected at a certain stage in the examination may be modified to a considerable extent, or even be suppressed altogether. An adequate account of conditions of this sort cannot be given in the present article, and they are not stated with any degree of completeness in the more elementary manuals on inorganic analysis. Good accounts of the various difficulties of this sort will be found, however, in Douglas and Prescott's 'Qualitative Chemical Analysis,' to which the reader is referred. The existence of difficulties and limitations being recognized, a general scheme for the detection of the commoner metallic elements may be given, which will be found to work satisfactorily in the majority of cases.

The first step in making an analysis in the wet way is to ensure the absence of organic matter, which might seriously interfere with the subsequent reactions. If organic matter be present, it may usually be detected by heating a part of the compound in a closed tube. If it blackens, or gives off a characteristic empyreumatic odor, organic matter is probably present, and it must be destroyed either by the continued application of heat, or (if there appears to be danger of losing any essential part of the inorganic substance by volatilization) by warming it with strong sulphuric acid. The organic matter being destroyed by either of these methods, the next step is to bring the substance into a state of solution. Water, either cold or hot, should first be tried as a solvent. If this does

CHEMICAL ANALYSIS

not suffice, hydrochloric acid or nitric acid may be tried. If these reagents fail to dissolve it, one part (by weight) of the substance may be mixed with five parts of sodium carbonate and five of potassium carbonate, and the whole heated in a porcelain crucible until quiet fusion is attained. (This may take 30 minutes.) The crucible and its contents are then allowed to cool, and are immersed in dilute hydrochloric acid, or (if silver is suspected to be present) in dilute nitric acid. In this way most of the commoner insoluble substances may be brought into a state of solution. For methods that are applicable to substances that resist this mode of treatment, the more advanced treatises on analysis must be consulted. In case a part of the substance to be analyzed dissolves in water or in one of the other solvents, a separate examination of the solution so obtained should be made, the insoluble part being reserved for subsequent treatment, by the method indicated above.

The metals that will be considered in the present article may be divided into seven general groups, according to their behavior when treated with certain reagents that are known as "group reagents." These classes or groups are as follows:

1. Metals forming chlorids that are insoluble in water, and which are precipitated as chlorids upon adding hydrochloric acid to their solutions. (Silver, lead, and mercurous mercury.)

2. Metals that are precipitated from their acid solutions, by sulphuretted hydrogen, in the form of sulphids that are insoluble in ammonium sulphid, $(\text{NH}_4)_2\text{S}$. (Mercury, lead, bismuth, cadmium, copper, and silver.)

3. Metals that are precipitated from their acid solutions, by sulphuretted hydrogen, in the form of sulphids that are soluble in ammonium sulphid. (Arsenic, antimony, and tin.)

4. Metals whose sulphids are insoluble in water, and which are precipitated from neutral solutions, by ammonium sulphid, either as sulphids or as hydrates. (Iron, manganese, cobalt, nickel, and zinc are precipitated as sulphids; aluminum and chromium as hydrates.)

5. Metals which, upon addition of ammonium carbonate, are thrown down in the form of carbonates that are insoluble in ammonium chlorid. (Barium, strontium, and calcium.)

6. Metals which, upon addition of ammonium carbonate, are thrown down in the form of carbonates that are soluble in ammonium chlorid. (This group contains the single metal magnesium.)

7. Metals which remain in solution when treated by any or all of the foregoing reagents, and all of whose important compounds are soluble. (Potassium, sodium, lithium, and ammonium.)

It will be observed that none but the commoner metals are included in the foregoing list. For the relations of the rarer ones, and for their detection, reference may be had to the manual of Douglas and Prescott, referred to above.

The separation of the groups that are defined above may be effected as follows: Hydrochloric acid is added to the solution under examination, drop by drop, until no further precipitation takes place. The white precipitate consists of the chlorids of the metals of

Group 1, and is to be preserved for further examination. The solution is filtered, and a drop or two of hydrochloric acid is added to the clear filtrate, to make sure that this reagent is incapable of inducing further precipitation. Sulphuretted hydrogen gas is then passed through the filtrate until the liquid smells strongly of the gas. If a precipitate is formed, it will consist of the sulphids of the metals of the second and third groups. Silver, however, will not (in general) be present, because it is ordinarily completely precipitated in the first group, and has therefore been already removed by filtration. Lead may not be completely precipitated in the first group, and hence its sulphid may occur in the present precipitate. The mercury in the present precipitate represents mercuric mercury in the original solution. The mixed sulphids of Groups 2 and 3 are removed by filtration, and are washed until the wash water is no longer acid. They are then boiled with ammonium sulphid. This reagent leaves the sulphids of Group 2 undissolved, but dissolves those of Group 3. Filtration then leaves the sulphids of Group 2 on the filter paper; and when the filtrate is acidified by the addition of hydrochloric acid, the sulphids of Group 3 are thrown down again.

The clear filtrate from which Groups 2 and 3 were removed by sulphuretted hydrogen gas is next made slightly alkaline by the addition of ammonia, and heated almost to boiling. Ammonium sulphid is then added, and the whole is kept warm for some time. The sulphids (or hydrates) of Group 4 are thus precipitated, and may be isolated by filtration. The filtrate from this operation is next boiled to expel all the sulphuretted hydrogen, and ammonia and ammonium chlorid are added. The solution is then heated to the boiling point, and treated with a solution of ammonium carbonate, $(\text{NH}_4)_2\text{CO}_3$. This causes the precipitation of the carbonates of Group 5, which are removed by filtration. The filtrate is boiled, and then treated with a solution of sodium phosphate, Na_2HPO_4 , to which one sixth of its volume of ammonia has been added. Magnesium, the metal of the sixth group, is thrown down (if present) in the form of a white crystalline precipitate having the formula $\text{Mg}_2(\text{NH}_4)_2\text{P}_2\text{O}_7$. This is again removed by filtration, and the filtrate will contain, in solution, the metals of Group 7.

The several groups being thus separated, it remains to examine each group by itself, to see how its components may be isolated or otherwise recognized.

Group 1. The chlorids of this group, as obtained in pursuing the general scheme outlined above, may be separated very readily. Thus if the precipitate of mixed chlorids be treated with boiling water, the chlorids of silver and mercury will be unaffected; but the chlorid of lead will dissolve, and may therefore be isolated by filtration. The mixed chlorids of silver and mercury may be separated by treatment with hot ammonia. This reagent dissolves silver chlorid, which is again precipitated in the form of chlorid upon neutralizing its solution with nitric acid. The hot ammonia does not dissolve mercurous chlorid, but transforms it into a black substance that contains mercury, chlorine, nitrogen, and hydrogen, and remains behind upon the filter paper.

CHEMICAL ANALYSIS

Group 2. All the silver present being assumed to be removed in the first group, the mixed sulphids of Group 2 are washed until the wash water ceases to redden blue litmus paper, and are then boiled with a small quantity of nitric acid. Lead, bismuth, cadmium, and copper pass into solution in the form of nitrates, while mercury sulphid remains unchanged, and may be isolated by filtration. The filtrate, containing the mixed nitrates, is evaporated to a small volume, and sulphuric acid is added. This precipitates lead sulphate, which appears as a whitish precipitate, removable by filtration. The filtrate from this last operation may contain the nitrates of bismuth, cadmium, and copper. If it is made alkaline by the addition of ammonia water, any bismuth that it contains will be thrown down in the form of the hydrate. The cadmium and copper nitrates are simultaneously reduced to the form of hydrates, which, however, remain in solution. Upon passing sulphuretted hydrogen through the solution containing them, a precipitate consisting of cadmium sulphid and copper sulphid is thrown down. If this is boiled with dilute sulphuric acid the copper sulphid remains unaffected, while the cadmium sulphid passes into solution. From the solution, sulphid of cadmium may be again thrown down by adding ammonia till the reaction is alkaline, and then passing sulphuretted hydrogen through the solution. If cadmium is present, its sulphid is thrown down as a bright yellow precipitate.

Group 3. When the sulphids of Group 3 have been isolated, some information may be had at once from the color of the precipitate. Thus arsenic sulphid is yellow, antimony sulphid is red, and tin sulphid is black. If only one of these elements is present, it may therefore be detected by the color of its sulphid. If more than one are present, the mixed sulphids are treated with a solution of ammonium carbonate $(\text{NH}_4)_2\text{CO}_3$. The sulphids of antimony and tin are unaffected, but the sulphid of arsenic passes into solution, and after filtration it may be again thrown down by the addition of hydrochloric acid. The mixed sulphids of antimony and tin are transferred to a porcelain dish, and heated with a small quantity of hydrochloric acid, to which a few crystals of chlorate of potash have been added. By this treatment they are reduced to the form of chlorids. The solution containing the mixed chlorids of antimony and tin should then be somewhat diluted, and a piece of platinum foil wrapped in zinc should be added. By the electrolytic action so set up, antimony and tin are thrown down, in the metallic state, upon the platinum foil; and the foil will be blackened in spots, if antimony be present. In any case the foil should be washed and boiled with hydrochloric acid diluted with its own bulk of water. In this way any tin that may be present is brought into the form of the chlorid, which dissolves; the antimony remaining unaffected. The presence of tin chlorid in solution may be readily demonstrated by the addition of a solution of corrosive sublimate. The tin is thereby reduced to the form of a higher chlorid, and a precipitate of Hg_2Cl_2 (calomel) is thrown down. If no tin is present, this precipitate is not formed.

Group 4. The metals of Group 4 are obtained, in the general scheme of separation out-

lined above, in the form of sulphids and hydrates. The precipitate containing them is to be treated in a porcelain dish with cold dilute nitro-hydrochloric acid. The sulphids of nickel and cobalt remain unaffected, and may be removed by filtration, since the other metals pass into solution. The precipitate that is undissolved should be tested in a borax bead before the blowpipe. (See BLOWPIPE ANALYSIS.) Cobalt gives a blue bead, while nickel gives a reddish-brown one. If both metals are present, the color is intermediate between these two. In the reducing flame the reddish-brown color due to nickel changes to a gray, while the blue of the cobalt remains unaltered; hence the reducing flame should be tried, if no decided indication of cobalt is obtained in the oxidizing flame. For other and more exact tests for distinguishing cobalt from nickel, special treatises on qualitative analysis should be consulted; see, for example, the treatise of Douglas and Prescott, and also Eliot and Storer, 'A Compendious Manual of Qualitative Chemical Analysis.' Nickel and cobalt being removed from the metals of Group 4 by the means indicated above, the filtrate containing the remaining members of the group is boiled until all the sulphuretted hydrogen is expelled. A little nitric acid is then added, and the solution is again boiled until the greater part of the acid is driven off, when the remaining solution is diluted with water. The small amount of free acid that is still present is neutralized with sodium carbonate, care being taken that no permanent precipitate is formed. The solution is allowed to cool, barium carbonate is added in the cold, and the whole is allowed to stand for fifteen minutes. The precipitate contains the aluminum, chromium, and iron in the form of hydrates, and also the excess of barium carbonate. The filtrate contains manganese and zinc. The precipitate is removed by filtration, dissolved in dilute hydrochloric acid, gently warmed, and made alkaline by ammonia. By this process the hydrates of aluminum, chromium, and iron are thrown down, free from barium. This precipitate of the hydrates is collected on a filter, dried, transferred to a porcelain dish, and dissolved in concentrated nitric acid. A few crystals of potassium chlorate are then added, and the solution is boiled for several minutes. Upon adding sodium hydrate in excess, the iron is thrown down in the form of hydrate, the aluminum and chromium remaining in solution. The iron being removed by filtration, the filtrate is divided into two portions. One of these portions is made acid with nitric acid, and ammonia is added in excess. Aluminum hydrate is thrown down, if aluminum is present. The other portion of the filtrate is made acid with acetic acid, and lead acetate is added. If chromium is present, a yellow precipitate of chromate of lead, PbCrO_4 , is thrown down. The filtrate from the treatment with barium carbonate, which may contain zinc and magnesium, is heated to boiling, and the barium that it contains is completely precipitated with dilute sulphuric acid. The precipitate of barium sulphate is removed by filtration, and the filtrate is boiled, after addition of sodium hydrate in excess. If manganese is present, it is precipitated in the form of the hydrate, and may be removed by filtration. The filtrate from this operation is

CHEMICAL ANALYSIS

acidified with acetic acid, and treated with sulphuretted hydrogen gas. If zinc is present, it is thrown down in the form of a white precipitate of zinc sulphid, ZnS .

Group 5. The metals of this group (barium, strontium, and calcium) are isolated, in the general scheme, in the form of carbonates. To separate them from one another, the mixed carbonates are dissolved in dilute acetic acid, and a portion of the solution is tested for barium by the addition of potassium chromate, K_2CrO_4 (not the bichromate, $\text{K}_2\text{Cr}_2\text{O}_7$). If barium is present, a straw-yellow precipitate of barium chromate, BaCrO_4 , is thrown down. If barium is not present, we may proceed at once to the tests for calcium and strontium; but if it is present, it must first be removed from the solution by cautiously adding potassium chromate until no further precipitate is formed, and then filtering. In this case it is necessary to remove the excess of chromate of potassium before testing for calcium and strontium, because these two metals cannot be separated in the presence of that reagent. For this purpose the filtrate containing the strontium and calcium (which must be perfectly free from barium chromate, even though several successive filtrations may be necessary in order to make it so,) is made alkaline by ammonia, and ammonium carbonate is then added until the carbonates of strontium and calcium are all precipitated, the potassium chromate remaining in solution. After filtration and thorough washing, the mixed carbonates of strontium and calcium are dissolved in hot acetic acid, and the solution is boiled. Dilute sulphuric acid is then added; and if the acid is sufficiently dilute, a white precipitate of sulphate of strontium is thrown down, while the sulphate of calcium (which is formed at the same time) remains in solution. After standing for fifteen minutes or more, in order that the precipitation of strontium sulphate may be complete, the solution is filtered, and the clear filtrate is tested for calcium by first adding ammonia until an alkaline reaction is obtained, and then adding a solution of oxalate of ammonia. If calcium is present, a white precipitate of calcium oxalate is obtained.

Group 6. This "group" contains magnesium only. Hence the presence of magnesium will be made apparent at once in the course of the preliminary separation into groups.

Group 7. Potassium, sodium, lithium, and ammonium belong to this class. These metals are characterized by the high solubility of all their important salts. Ammonia, being used in the separation of the groups as a reagent, is sure to be present in the final solution that has been designated as containing the metals of "Group 7." Hence if it is desired to test for that substance, the test should be made upon a specimen of the original solution, before any ammoniacal reagent has been added. The test is very simple, and consists merely in heating some of the proposed solution with milk of lime (calcium hydrate in suspension). All salts of ammonia are decomposed in this way, with the liberation of ammonia gas, which may be recognized by its smell or by its turning moist red litmus paper blue. The general nature of the reaction involved in the liberation of ammonia gas may be illustrated by the case of ammonium sulphate. We have $(\text{NH}_4)_2\text{SO}_4 + \text{Ca}(\text{OH})_2 = \text{CaSO}_4 + 2\text{NH}_3 + 2\text{H}_2\text{O}$. Sodium, potassium,

and lithium may be sought for in the final filtrate obtained in the separation of the fundamental groups, since no compounds of those metals have been used as "group reagents." They are best identified by means of the colors that they communicate to the flame of a Bunsen burner. For performing a test of this sort, the filtrate containing these metals should be evaporated to dryness in a porcelain dish, and the residue ignited until any ammoniacal salts present are eliminated by volatilization. The dish is then allowed to cool, and its contents are moistened with a few drops of distilled water. A piece of platinum wire is next thoroughly cleaned, moistened with hydrochloric acid, and held in the Bunsen flame until it ceases to communicate any color. The wire is then dipped into the solution in the dish, and again held in the flame. Potassium salts give a fine blue color, lithium salts a red, and sodium salts an orange yellow. Unless sodium is present in very small amount, its strong, brilliant flame-color is almost certain to obscure the colors due to any other elements present. Chemists therefore make use of colored glasses that are practically opaque to sodium light, using them as screens through which to view the Bunsen flame. The commonest glass of this kind is the "cobalt-blue" glass, which is used for the detection of potassium, since it is quite transparent to the flame-color of that metal.

For methods of examination adapted to the detection of gold, platinum, and other of the less common metals, reference must be made to books on chemical analysis.

The metals that exist in a proposed substance being known, it remains to discover in what chemical combinations they are present. It is usually impossible to learn, by mere qualitative analysis, which of the acid radicals that may be present is combined with any given one of the metals; but it is possible to ascertain that certain kinds of compounds (such as sulphates, chlorids, and the like), are present, and a chemist of experience, who is familiar with the kind of work in hand, can often infer, with considerable probability, how the bases and acids are associated with one another. In the present article it is not possible to discuss this difficult phase of analysis, but a few of the more common tests for the presence of acid radicals may be given.

There is no general scheme for the detection of these radicals, by which they are separated into groups like the metals, and eventually isolated singly. In examining a substance for them, all that can be done is to apply certain tests, largely independent of one another, and best carried out by dividing the original solution into a number of parts, each of which is to be examined for a single class of acid radicals, and then thrown away.

When a solution of barium chlorid is added to a neutral or slightly alkaline solution, a precipitate of the corresponding barium compounds is thrown down if the solution tested contains sulphates, phosphates, borates, oxalates, fluorides, carbonates, silicates, tartrates, sulphites, hyposulphites, arseniates, arsenites, or chromates. (If the original solution contains lead, silver, or mercury, nitrate of barium is used as a reagent in the place of the chlorid, because otherwise a precipitate of the chlorids of those metals would also be obtained.) The mixed pre-

CHEMICAL ANALYSIS

precipitate just obtained is isolated by filtration, washed, and treated with dilute hydrochloric acid. All of the compounds named pass into solution, with the single exception of the sulphate; and if a white, insoluble precipitate remains after treatment with dilute hydrochloric acid, the presence of sulphates in the original solution is demonstrated. The hydrochloric acid solution is next made alkaline by ammonia, when a precipitate will again be thrown down, if the original solution contained oxalates or phosphates. Certain other salts also may be thrown down at this point; and, therefore, if any precipitate is obtained, confirmatory tests for oxalic and phosphoric acids should be applied to the original solution before the presence of those substances can be regarded as really proved.

If the original solution contains a carbonate, it will effervesce upon the addition of hydrochloric acid, owing to the liberation of carbon dioxid. If it contains a sulphite, the addition of hydrochloric acid will liberate sulphur dioxid, which is readily recognized by smell. If it contains a hyposulphite, sulphur dioxid will also be liberated, but the solution will at the same time become turbid from the liberation of free sulphur. If it contains an alkaline silicate (other silicates are not soluble in water) in considerable quantity, the addition of hydrochloric acid will cause the silicic acid to separate in the form of a gelatinous precipitate, which, when dried and ignited, is gritty. The presence of the arsenic acids may be established by Marsh's test for arsenic. (See ARSENIC.) If a tartrate is present, the original compound, when obtained in the solid state by evaporation or otherwise, is blackened by heat, with a characteristic odor suggestive of burnt sugar. The presence of a fluoride in the original substance is established by the liberation of hydrofluoric acid (see FLUORIN) when that substance is heated gently with concentrated sulphuric acid. The presence of a chromate is indicated by the precipitate from the addition of barium chlorid exhibiting a yellow color. As a confirmatory test, a solution of lead acetate may be added to a neutralized sample of the liquid under examination. If a chromate is present, a yellow precipitate of chromate of lead is thrown down, which is soluble in caustic soda, but insoluble in acetic acid. To test for the presence of borates, a sample of the original liquid is acidified with hydrochloric acid, and a piece of turmeric paper is wetted with it, thoroughly dried before a flame, and finally moistened with a solution of sodium carbonate. If a borate is present, the color of the paper, where wetted with the sodium carbonate, changes to a greenish black.

To test for chlorids and certain other salts, a fresh specimen of the original solution should be chosen, and if it is not already acid, it should be made so with nitric acid. A solution of nitrate of silver is then added, whereupon a precipitate will be thrown down if chlorids, bromides, iodides, cyanides, or sulphids are present. (Cyanid of mercury, however, gives no precipitate at this point.) The precipitate should be removed by filtration, thoroughly washed, and then treated with hot ammonia. The chlorid, bromide, and cyanide of silver dissolve, while the sulphid and iodide remain behind, unchanged. The sulphid is black, while the iodide

is yellowish. For methods of distinguishing between the chlorid, bromide, and cyanide precipitates, reference must be made to the works on chemical analysis. It may be said, however, that the cyanide, when heated is reduced to metallic silver, with the liberation of cyanogen gas. The presence of an iodide, when this is made doubtful by the black precipitate due to a sulphid, may be further investigated by the iodide of starch test. (See IODINE.)

Nearly all of the nitrates and acetates are soluble, and hence precipitation tests are not commonly used for the detection of nitric and acetic acids. Color tests are usually employed instead. To test for acetic acid, the original solution may be made neutral, and a few drops of ferric chlorid added. If acetates are present, the solution takes on a dark red color, owing to the formation of ferric acetate. To test for nitrates, a portion of the original solution is mixed with a solution of ferrous sulphate in a test tube, and strong sulphuric acid is poured down the side of the inclined tube, in such a manner as not to mix with the contents, but to form a layer at the bottom of the tube. If nitrates are present, a purplish or reddish ring, changing to a dark brown, will be observed at the surface of separation of the two liquids.

QUANTITATIVE ANALYSIS OF INORGANIC SUBSTANCES.

Quantitative analysis is far more difficult than mere qualitative analysis, and cannot be treated adequately in a popular encyclopædia. As has been said, unless the nature of the substance is known in some other manner, a preliminary qualitative analysis must be made. Several usual methods of making quantitative analyses will be described below.

Electrolytic Method.—When the substance to be analyzed is an alloy, or a simple mixture of metallic salts, its metallic components may often be readily separated by the electrolysis of its solution, the separation of the metals being based upon the known fact that in electrolysis the nature of the deposit depends largely upon the nature and degree of concentration of the solution, the sizes of the electrodes, and the strength of the electric current that is employed. By systematic study of the effect of these conditions in the electrolysis of mixtures of metallic salts, it is found to be possible to deposit one metal upon the cathode, while the others remain in solution. The electrolytic method has been developed to a considerable extent, and promises to be of great value. Thus far, however, it is not in extensive general use. For details concerning it, consult Classen, 'Quantitative Analysis by Electrolysis,' and the various papers that have been published by Prof. Edgar F. Smith, for some years past, in the *Journal of the Franklin Institute*. See also the article *ELECTROLYSIS* in this encyclopædia.

Gravimetric Methods.—Strictly, any method of analysis in which the quantity of each constituent is determined by weighing is a gravimetric method; but the term is usually understood to exclude the electrolytic method just mentioned. In gravimetric work the components that are to be weighed may be separated by fire-methods, or by selective precipitation from solutions, as in the scheme of qualitative analysis outlined above. The fire-methods are commonly used in the estimation of gold and silver,

CHEMICAL ANALYSIS

and are described in the article ASSAYING. The wet methods do not differ in general theory from the method given above for qualitative analysis; for it is evident that any precipitate which contains only one base may be isolated and weighed, and that the quantity of the base present may be calculated from the observed weight of the precipitate, and its known chemical formula. But the practical case is by no means as simple as this statement would indicate; for certain matters of detail, that are not of the slightest importance in qualitative work, must be attended to with great care in quantitative analysis. For example, the substance that is to be determined must be isolated by a method that will ensure its perfect separation from every other substance that may be present; the precipitate that is to be weighed must be granular enough to be filtered easily and without loss; the precipitate must not be liable to oxidation nor other change upon exposure to air for such time as its manipulation may demand; it must be of such nature that it can be thoroughly dried; and it must not be hygroscopic enough to absorb sensible quantities of water from the air, from the time it is dried until the weighing has been completed. Thus in qualitative analysis aluminum may be recognized by the precipitation of the hydrate; but in quantitative analysis it is necessary to reduce the metal to the form of the oxid. The hydrate is usually gelatinous when freshly precipitated, and it retains traces of the acid with which the metal was previously combined, and also traces of the alkali that was used in the precipitation of the hydrate. These facts are of no consequence in qualitative work, but their importance in quantitative investigation is evident.

Volumetric Methods.—In volumetric analysis the quantities that are to be measured are determined by the measurement of volumes, and weighings are resorted to only in the preparation of the standard reagents that are to be used. The reagents are made up in certain standard strengths, according to the purposes for which they are wanted; but the usual strengths are those designated as "normal" and "decinormal" solutions. A "normal" solution is one having such a strength that one litre of the solution contains as many grams of the reagent as there are units in the reagent's chemical equivalent. Thus the chemical equivalent of sodium hydrate, NaOH , is (in round numbers) $23 + 16 + 1 = 40$; and hence a "normal" solution of sodium hydrate is one which contains 40 grams of that substance to the litre. A "decinormal" solution of this reagent contains 4 grams of it per litre, and a "centinormal" solution contains 0.4 gram per litre. If the reagent is a bivalent acid, or a salt of a bivalent base, the number of grams of it present in each litre of solution must be equal to half the molecular weight. Thus sulphuric acid, H_2SO_4 , contains two atoms of replaceable hydrogen, and its molecular weight is $2 + 32 + 64 = 98$. Hence a normal solution of sulphuric acid contains 49 grams of the anhydrous acid, per litre of solution. The general idea is to have all of the reagents of such a strength that if one cubic centimeter of any "normal" acid solution be added to one cubic centimeter of any "normal" alkaline solution, the mixture will be precisely neutral. As an illustration of the method that is followed, let it be assumed that a manufac-

turer buys a carboy of oil of vitriol, and wishes to know what proportion of pure sulphuric acid it contains. If the acid were quite free from water, 49 grams of it would be exactly neutralized by 1,000 cubic centimeters (that is, one litre) of any normal alkali solution. It is more convenient to work with one tenth of this quantity of acid and reagent; so that the experiment will consist in weighing out 4.9 grams of the oil of vitriol, diluting it with water, adding a piece of litmus paper, and letting a normal alkali solution pass into it (preferably from a graduated burette) until the acid is precisely neutralized. If 100 cubic centimeters of the alkali were required to effect the neutralization, the given sample of oil of vitriol would be known to contain 100 per cent of its weight of sulphuric acid,—or to be entirely free from water. On the other hand, if only 53.9 cubic centimeters of the normal alkali solution were required to effect neutralization, the sample would be known to contain 53.9 per cent of its own weight of sulphuric acid. As a further example, suppose it is desired to ascertain the percentage of sodium oxid present in a given sample of crude soda ash, without raising the question as to whether the sodium actually occurs as oxid, hydrate, or carbonate. The formula of sodium oxid is Na_2O , and its molecular weight is $46 + 16 = 62$. As it contains two atoms of sodium to the molecule, we weigh out 3.1 grams (not 6.2 grams) of it, dissolve in water, and dilute and add litmus paper as before. Then into the solution we pass a normal acid solution until neutralization is effected. If 46.7 cubic centimeters of the normal acid solution are required, the alkali present in the sample, when computed as sodium oxid, constitutes 46.7 per cent of the weight of the whole. This process is called "acidimetry" when it is used for estimating the strengths of acids, and "alkalimetry" when it is used in estimating the strengths of alkalis. As a further illustration of volumetric methods the estimation of chlorine (known as "chlorimetry") may be considered. If the substance to be examined for chlorine is bleaching powder, 10 grams of the powder are dissolved by rubbing with water in a mortar, and the solution is diluted till it occupies a litre. It is then well shaken, and 100 cubic centimeters are drawn off into a beaker, by means of a pipette, and treated with a decinormal solution of arsenious acid (As_2O_3) until a drop of the mixture, when withdrawn by a glass rod, gives no blue stain upon filter paper that has been soaked in starch liquor and iodide of potassium. The number of cubic centimeters of decinormal arsenious acid solution required is to be multiplied by the constant multiplier 0.00355, and the product is the weight of available chlorine, in grams, contained in each gram of the original powder. (For explanation of the multiplier 0.00355, and for full details of this process and of volumetric analysis generally, consult Francis Sutton, 'Systematic Handbook of Volumetric Analysis'.)

The analysis of gases is of so special a character that it is treated under a separate heading. See GASOMETRIC ANALYSIS.

ORGANIC ANALYSIS.

In the analysis of organic compounds, no general scheme can be given, corresponding to

CHEMICAL INDUSTRY

that which is used in the systematic examination of inorganic substances. The number of possible organic compounds is so great, that practically nothing can be done in the way of effecting a "proximate" analysis of a compound concerning whose general nature we have no preliminary information. For the more or less general methods that have been developed for the examination of special classes of organic substances, advanced books on organic analysis must be consulted. The ultimate analysis of an organic substance consisting of oxygen, hydrogen, and carbon, may be effected by burning the substance in a glass tube in a current of oxygen gas. The carbon is converted into carbon dioxide, which is absorbed by potash and estimated quantitatively by observing the gain in weight of the potash; and the hydrogen is converted into water, which is similarly estimated by absorption by calcium chloride. The oxygen of the original compound is then estimated by difference. When nitrogen is also present, the process is somewhat more complicated. In this case the gases of combustion may be passed over red-hot metallic copper

may be considered to have been in existence, at this time, about 100 years. In common with other leading manufactures, it has reached large proportions. Almost every State of the Union has chemical establishments of some kind. The industry is affected for good or bad in quick response to the rise and fall of other manufactures.

Before the Revolution no chemicals were made here. From such reports as are obtainable it appears that 8,000 pounds of copperas were made in Vermont in 1810, and a smaller quantity in Maryland in the same year. In 1813 alum was made in the latter State. Oil of vitriol was manufactured in Philadelphia in 1793. At Baltimore, the manufacture of chemicals, paints, and medicine began in 1816. In the census of 1820, two chemical establishments were reported from New York.

By 1830 the industry was firmly established in the United States, Philadelphia being the centre. There were then 30 firms in the business in the entire country, having a capital of \$1,158,000, and producing articles valued at \$1,000,000 per annum. Alum, copperas, and some other articles were manufactured to the

A. D. RISTEEN,

Editorial Staff 'Encyclopedia Americana.'

Chemical Industry, The. Labor is a combined effort of the animal kingdom, led by mankind, to overcome and subdue, to subject and utilize, the forces of nature. Labor, in its various relations, assumes forms that are both psychical and physical in character. Groups, combinations, and subdivisions of these forms exist in the great war of the animal kingdom on the solid, fluid, and gaseous conditions of matter. Hence it is that the chemist and chemical manufacturer are called on to organize and array the final attack on all known productions of the earth, of the water, and of the atmosphere.

The chemical industry of the United States

Vol. 4—35

almost entire exclusion of the foreign product. The list of productions included calomel and various other mercurial preparations, Glauber's and Rochelle salts, tartar emetic, ammonia, sulphate of quinine, oil of vitriol, tartaric, nitric, muriatic, oxalic, and acetic acids, aqua fortis, Prussian blue, chrome yellow, chrome green, refined saltpetre, refined borax, refined camphor, acetate and nitrate of lead, prussiate of potash, and bichromate of potash.

The totals for the chemical industry, as reported in last census, are shown in the following summary:

CHEMICAL INDUSTRY IN 1900	
Number of establishments reporting.....	1,740
Capital:	
Direct investment.....	\$238,529,641
Officers, firm members, and clerks:	
Total number.....	8,605
Total wages.....	\$ 11,340,385
All other employees:	
Total number.....	61,553
Total wages.....	\$ 21,799,251
Cost of materials used.....	124,043,837
Value of products.....	221,217,217

The principal products reported, and their quantity and value, are shown in the table above.

The most important of all chemical products

CHEMICAL INDUSTRY

is sulphuric acid, which maintains its supremacy over any other known article in promoting the manufacturing interests of the world. The large increase in the quantity produced, together with the reduction in price, indicates the advance that has been made in general manufactures in the United States during the decade intervening.

From technical considerations, manufactured manures are the next in importance to sulphuric acid in the category of chemical productions. The total of 2,887,004 tons of these materials produced, indicates, by no inaccurate measure, the extent of the farming interests of the country. When we consider that about 300 pounds of artificial fertilizer are commonly used to one acre of land, it is seen that nearly 20,000,000 acres were enriched by its use. The increase in manufacture over 1890 is 1,023,398 tons. These figures show that large areas of our country are becoming unprofitable to farm without the use of these aids to fertilization; and the existence of factories in the States of California, Illinois, Indiana, Michigan, Minnesota, and Wisconsin is indicative of the gradual exhaustion of soil that was virgin in character less than 30 years ago. These facts tend to show that the time is approaching when none of our unmanured soils will yield in remunerative quantity. They prove that economies are coming into practice in the utilization of material that formerly ran to waste.

The farmer occupies a reversed position to that of the manufacturer of artificial manures. By prodigal wastefulness and culpable ignorance, he permits immense quantities of manurial matter to find their way to the sea, while bemoaning his lot and sighing over the yield of virgin lands in comparison with that of his own; whereas the manufacturer, by the aid of chemical skill and mechanical devices, converts refuse matter into valuable merchandise.

The figures presented here yield consolation to the farmers of the Atlantic slope. When the not distant time arrives for the extinguishment of an agriculture that is based on primordial soil, the lands of these regions will recover their lost value; for the facts herein submitted tend to show how closely fertility is allied to the production of manufactured manures, and this manufacture can be carried on most profitably at those points where supplies of foreign crude material can be obtained, and where seaboard transportation can be made available.

The States of the Union often provide chemical manufactures relatively to their natural products; but the markets for chemicals are situated chiefly at such attractive points as the great centres of textile manufacturing, of dyeing and bleaching works, and of the oil-refineries and artificial-manure works; hence chemical works are to be found principally at or near these points.

The leading articles of raw material and their derivatives used in chemical manufactures, briefly stated, are as follows:

RAW AND MANUFACTURED CHEMICALS

RAW MATERIAL	MANUFACTURED ARTICLES OR DERIVATIVES
Brimstone or sulphur; pyrites containing sulphur.	Oil of vitriol, or sulphuric acid, the most important of all chemicals.
Nitrate of soda.	Nitric acid and all nitrates.
Salt (common).	Soda; muriatic acid.

RAW MATERIAL	MANUFACTURED ARTICLES OR DERIVATIVES
Potash salts.	Bichromate of potash, prussiate of potash, and many other combinations.
Nickel ores. Chromic-iron ores.	Salts of nickel, for plating. Chromates of potash and soda.
Antimony ores. Bismuth ores. Copper ores.	Alloys; medicinal salts. Alloys; medicinal salts. Sulphate of copper, or blue vitriol.
Cobalt ores. Iron ores.	Oxide of cobalt. Sulphate of iron, or coppers.
Lead ores.	White and red lead; litharge.
Manganese ores. Mercury ores.	Disinfectants; chlorine. Calomel; white and red precipitate; vermilion.
Zinc ores. Gold. Silver. Innumerable vegetable productions.	Oxide of zinc. Chloride of gold. Nitrate of silver. Dyeing extracts; alkaloids; acids; and pharmaceutical preparations.
Linseed. Cotton-seed. Cotton. Corn and all cereals. Wood.	Paints. Soap; oils used in cooking. Guncotton. Glucose; alcohol; starch. Explosives; oxalic acid; potash; acetic acid, paper.
Argol or tartar.	Tartaric acid; cream of tartar.
Borate of lime. Barytes. Chalk. Iodine.	Borax. Paints. Whiting. Sublimed iodine; all iodides.
Limestone. Magnesia.	Lime; carbonic acid. Carbonate and sulphate of magnesia.
Ochres. Crude phosphates. Fats. Animal matter, such as horns, hoofs, and leather. Oils. Coal (bituminous).	Paints. Phosphorus. Soap; glycerine. Prussiate of potash; artificial manures. Soap; Perfumes. Ammonia; coal-tar colors; cyanide of potash.
Clays. Corundum. Cryolite. Silica or sand. Tin.	Alum. Aluminum. Alum; soda. Silicate of soda; glass. Tin-salts, for dyeing purposes.
Atmospheric air. Water.	Oxygen. Gas; hydrogen; oxygen.

The innumerable variety of combinations made of the raw materials named renders it impossible to state them in any limited space. The variety of raw materials, and of the numberless combinations thereof, gives to the chemical industry a unique position. No other branch of manufacture can approach it in scope, in the necessity for its existence, or in the knowledge required for its prosecution.

The merchandising in chemicals is of a complex character, and is based chiefly on chemical tests, both of the raw materials and of the manufactured articles. The markets of all quarters of the globe are scanned, and supplies, in many instances, are carried in large quantities, owing to the remote points of their production. The chemical industry affords one of the largest sources of transportation to railroad and water carriers, in raw materials as well as in partly finished and wholly manufactured stuffs. In many articles the competition of countries enjoying low prices for labor is difficult to meet. On the other hand, through advantages not enjoyed by foreign manufacturers, considerable exportation of certain chemicals is going on at this time.

CHEMICAL RAYS

The industries or trades dependent upon the manufacture of chemicals may be enumerated as follows:

INDUSTRIES USING CHEMICAL PRODUCTS

Woolen manufacture.	Tanning.
Cotton manufacture.	Glass manufacture.

The plant of a chemical works involves the use of a larger area of land than is necessary in other manufactures as the buildings adaptable to the operations are usually only one story high, nearly all the work being done on the ground floor, where large furnaces, grinding-mills, and engines can be placed. This is one reason that the capital required for the conduct of these manufactures seems disproportionate to the value of the products, in comparison with other branches of industry. In the eyes of one unversed in the art, a chemical works may appear to be only a mass of rude furnaces, old pots, and rough machinery; yet the establishment may contain appliances of the most costly description, such as underground flues; furnaces of the most modern construction; iron castings fashioned in innumerable forms and weights; copper vessels, coils, and stills; thousands of fire-bricks and other forms of refractory material; steam boilers of the most economical pattern; lofty chimneys; powerful engines; expensive pumps; mills of different kinds for the grinding and powdering of a great variety of materials; leaden chambers for acid making, with tanks, towers, and accessories of the same metal; platinum apparatus and stills for concentrating sulphuric acid; and chemical earthenware, vitrified to resist the action of acids. Indeed, it may be stated that a chemical works of any magnitude contains and requires every manufacturing appliance used or known, excepting those adapted especially to weaving and printing.

Skill and scientific knowledge are needed in the successful conduct of manufacturing chemistry at this time to an extent unthought of by the men who were good workers 20 years ago. The competition of scientific Germany in many departments of chemical manufacture has forced the progress of an industry that was yet in its infancy two decades ago. The laboratory, well equipped with careful workers and good apparatus, has become the pulse of the whole establishment. Each step in the processes is indicated in the unerring results obtained by the analyst and tester, while the huge and costly machinery of the factory is the counterpart, to a great extent, of the miniature equipment of the laboratory. Chemical engineering is an important factor in the adjustment of plant to the exigencies of the difficult and tortuous operations. Some institutions of learning have recognized this fact by adding to their curriculum a course of chemical engineering. The advance in the manufacture of chemicals in the United States during the past 20 years has been marked, not by many changes of processes,

but essentially by the new appliances furnished by engineering skill.

The processes used in making chemicals are almost as varied as are the articles produced, but certain leading steps are essential to all, as grinding, furnacing, dissolving, separating, evaporation, filtration, and crystallization. The laws governing chemical constitution are closely followed at each step, and the processes improved and revised, from time to time, by the aid of mechanical contrivances. These changes are rendered more and more necessary as the strong competition of the age sweeps away old and unsuitable appliances.

Many chemical operations demand a long time for the production of finished material. Crystallization is of slow growth in many instances, and decomposition takes place very gradually in others; therefore another reason presents itself for the abnormal amount of capital required to carry on this branch of industry. Both crystallization and decomposition are hastened or retarded by many physical conditions; heat and cold, intense motion, and absolute quietude are in their turn called to the aid of the chemist. When we speak of crystallization we should bear in mind the fact that by this process the great purity of commercial chemical salts is obtained—sometimes, it may be, by frequent dissolvings and as many distinct crystallizations.

The chemical industry takes rank as the fourth among the great manufacturing divisions of the country, the three preceding it being (1) iron and steel, (2) woolen goods, and (3) cotton. (It may be well to explain that cattle-killing, the making of clothing, and of boots and shoes, and any other assembling industries are not considered manufacture proper.) The chemical industry represents a diversity of interests such as centre in no other department, and it affords to the United States a source of activity for labor, skill, and capital that is highly encouraging.

HENRY BOWER,

Henry Bower & Son, Manuf'g Chemists.
Chemical Mineralogy. See MINERALOGY.

Chemical Rays, a not very appropriate name given to the rays of higher refrangibility in the spectrum (q.v.). The blue and violet rays of the spectrum, and also the non-luminous rays at the violet end of the spectrum, have a peculiarly powerful chemical effect on silver compounds,—on photographic paper, for instance, which is prepared by moistening soft paper with solution of common salt, and then steeping it in solution of nitrate of silver. The blue, violet, and non-luminous rays at that end of the spectrum quickly blacken such paper when it is exposed to their influence. The remainder of the spectrum has not this power; for example, paper sensitized with silver salts is not attacked at all by yellow light. Hence the name "chemical rays" is given to those above mentioned. The term is, however, misleading, for there are other chemical compounds that are acted on by other parts of the spectrum; and the truth seems to be that for each particular sensitive compound there is one particular part, or sometimes two or three particular parts of the spectrum with maximum chemical influence for the decomposition of it.

CHEMISTRY

Chemistry, the science which deals with the composition and transformations of matter, had its origin in remote antiquity. In its earliest form it was purely empirical, a mass of disconnected facts which were brought to light in the natural course of development of various industries. In the extraction of metals from their ores, in the preparation of drugs and medicines, in the processes of dyeing, and the like, many chemical data were discovered; and of such facts a large number were known to the ancient Egyptians. Indeed, one plausible derivation of the word "chemistry" is from Khem, an early name for Egypt, which has reference to the blackness of its soil. With this name the Arabic word *khema*, to hide, seems to have some relation; and when we remember that much ancient learning was preserved for us by Arabian scholars, the descriptions of chemistry as the Egyptian science, or as the hidden or occult art, become intelligible. Secrecy was a characteristic of its early practitioners.

The one fundamental fact of chemistry is, that matter can undergo apparent transformations of kind, one substance being converted into another. For instance, wood becomes charcoal, and iron is changed to rust; and facts like these were evident even to the most primitive observers. As philosophy developed, these data were necessarily considered, the nature of matter was discussed, and attempts were made to correlate and explain the phenomena. Much of the early speculation was vague and mystical, and has little significance to-day; but a part of it was intensely practical, and gave a definite purpose to investigation. If matter can be transformed from one substance to another, why should not the possibility of change be universal? All metals, it was seen, had certain properties in common, and so transmutability between them was almost taken for granted. Thus alchemy arose, with its search for the philosopher's stone and its attempts to convert base metals into gold; and from alchemy the chemistry of to-day is lineally descended. The discoveries, even the failures of the alchemists laid the foundations of our modern science, and pointed out the best paths for investigation to follow.

The Greek philosophers, and especially Aristotle, in their attempts to interpret matter, assumed the existence of four elements, namely, earth, water, air, and fire. These names, however, denoted properties rather than things, and implied the attributes of coldness, wetness, dryness, and heat. The properties of matter were determined by these conditions, and could be expressed by the varying degrees under which the latter were displayed. Of chemical combination, as we understand it, the ancients seem to have had no clear conception; they sought to solve the problems of the universe by reasoning alone; the experimental method as a test of truth had not become a court of last appeal. To the alchemists, on the other hand, and to their successors, the iatrochemists, who applied chemistry to medical uses, experiment was the essential thing; and in their hands true knowledge rapidly increased. The alchemical elements, salt, sulphur, and mercury, were still names of properties; but they represented conceptions which stood closer to reality than the earlier ideas, since they were based upon more

exact observations. Speculation had not been dethroned, but it was no longer an absolute ruler.

To trace the history of chemistry during its formative period would be impracticable in an article of the present scope. It is enough to say that the modern distinction between elements and compounds was first clearly stated by Robert Boyle in 1661. An element is a substance that cannot be further decomposed, but which is obtainable from a compound body, and from which the latter can again be prepared. He also held that chemical combination consisted in an approximation of the smallest particles of matter, thus adopting the atomic hypothesis which had been current in philosophy from the very earliest times. With these teachings of Boyle modern chemical theory practically began.

The chemical researches of the 18th century were many and varied, but most of them, at least during the earlier decades, were essentially qualitative in character. The fundamental importance of exact weight and measure came into recognition with extreme slowness. Throughout the greater part of the century one theory dominated chemical thought, the theory of *phlogiston*, proposed by Becher, but developed and completed by Stahl. The phenomena of combustion had always attracted the attention of chemists, and the new theory was devised to explain them. Every combustible body was supposed to contain a peculiar non-isolable substance, *phlogiston*; and when combustion took place this substance was thought to be expelled. Thus lead, when heated in the air, undergoes a change analogous to that produced by combustion, and yields a calx, or, as we call it now, an oxide. This calx, combined with *phlogiston*, was thought to exist in the original metal, and to be freed from *phlogiston* when calcination occurred. In this speculation no account was taken of the weight of the several bodies, and the fact that the calx was heavier than the metal, that a gain, not a loss was observed, seemed to offer no difficulty to the believers in the phlogistic doctrine. To *phlogiston* a negative weight was ascribed, and by this device the real difficulties of the problem were comfortably laid aside.

In 1774 Joseph Priestly, himself a believer in *phlogiston*, discovered oxygen; and so made, though unwittingly, the true interpretation of combustion possible. In 1766 Cavendish had discovered hydrogen; and in 1781 he proved that water was produced by the union of the two new gases. Cavendish also determined the composition of the atmosphere, and in these researches the foundations of a new chemistry were laid. The two chief architects to build upon the foundation were a Frenchman, Lavoisier, and an Englishman, Dalton.

Lavoisier, by careful use of the balance as an instrument of research, proved that matter was constant in weight, and could neither be created nor destroyed. In any chemical change the weight of the substances engaged in the reaction remained unaltered. Studying combustion he showed that it was merely combination with oxygen; and he pointed out that respiration was a phenomenon of the same character. He also gave greater precision to the idea of an element, and announced the elementary nature of the metals; and, in conjunction with

CHEMISTRY

other chemists, did much toward the establishment of a rational system of chemical nomenclature. Hitherto the names of compounds had been arbitrary and often meaningless; now they were made to express with more or less accuracy the composition of the substances described.

Lavoisier died in 1794, a victim of the French Revolution; and it was not until 1803 that the next really great forward step in chemistry was taken by Dalton, who then first announced his famous atomic theory. To support this doctrine, which, being quantitative in form, had little in common with the atomistic speculations of the philosophers, Dalton established two laws, the laws of definite and multiple proportions. That every chemical compound has a fixed and definite composition was recognized by Lavoisier and by other writers before him, but the fact was disputed by Berthollet, and it remained for Dalton to give its statement a precise form. Dalton then went further, and found that to every element a definite combining number could be assigned, and that when two elements united in more than one proportion, even multiples of that number appeared. Thus, taking the hydrogen weight as unity, the standard of comparison, oxygen always combines with other elements in the proportion of eight parts or some simple multiple thereof, and so on through the entire list of elementary bodies. Each one has its own distinct combining weight, and this was a condition which Dalton sought to explain. Fractions of the weights did not occur, fractional atoms could not exist, and the two thoughts were connected by Dalton. Chemical union, to his mind, became a juxtaposition of atoms, whose *relative* weights were indicated by their combining numbers; and so the atomic conception was for the first time given a clear, quantitative expression. First, every element is composed of similar atoms which have constant weight. Secondly, chemical compounds are formed by the union of these atoms in simple numerical relations. Upon these fundamental statements the entire system of chemical philosophy rests, so that for a hundred years the history of chemistry has been the history of the atomic theory. All chemical calculations are based upon the atomic weights of the elements, and in all chemical formulæ they are implied.

Since Dalton's time great labor has been expended upon the exact determination of atomic weights, and in the discovery and description of new elements and compounds. The general conclusions which have been established by this class of researches may be summarized as follows: Every chemical substance is either an element or a compound. The elements, which are not separable into any simpler bodies, at least by no means yet discovered, are comparatively few in number; the compounds are innumerable. More than a hundred thousand compounds are already known. A compound may be separated into its elements or built up from them; and its composition is absolutely invariable. In this respect compounds differ from mechanical mixtures, in which any proportion may occur. Flour and sugar may be mixed together, but they still remain flour and sugar, each with its properties unchanged; no combination here takes place. In combination, as when *gaseous* hydrogen and *gaseous* oxygen unite to

form *liquid* water, they do so only in one fixed proportion and the characteristics of the original substances disappear. This fact of combination, the union of two or more bodies to form others which are widely different from them, is clear; but its mechanism is not yet understood. The elementary atoms of the compound are drawn and held together by some form of attraction, but its precise nature is unknown. The object of chemistry is to discover the laws which govern the union or the decomposition of substances, and to determine the limits within which such changes are possible. For the study of compounds, at least for the purpose of ascertaining their composition, two methods are employed. First, *analysis*, in which the component parts of the compound are separated, and individually identified. Secondly, *synthesis*, in which the parts are forced to unite, and to form the compound which happens to be under investigation. Furthermore, analysis may be either *qualitative* or *quantitative*. In one case we merely ascertain what substances are present, in the other we determine their exact quantity. The elements now known, about 80 in number, are given in the following table, together with their atomic or combining weights and their symbols. The latter are abbreviations whose use will be explained presently.

ELEMENTS, SYMBOLS, AND ATOMIC WEIGHTS.

Element	Symbol	Atomic Weight
Aluminum.....	Al	26.9
Antimony.....	Sb	119.3
Argon.....	A	39.6
Arsenic.....	As	74.4
Barium.....	Ba	136.4

In addition to these elements there are several others which are as yet imperfectly known and uncertain. Among them, polonium, actinium, holmium, europium, and dysprosium may be named. New elements are not infrequently discovered, and argon, helium, neon, xenon, krypton, and radium have all been brought to light within the last decade.

With the help of the elementary symbols, chemical formulæ can be constructed, and these are of great help in chemical calculations and reasoning. Some of the symbols are initial letters only, as H, O, N, C, for hydrogen, oxygen, nitrogen, and carbon; others are formed of two letters, like Ca for calcium and Zn for zinc. Still others are derived from the Latin names of the metals, such as Ag from *argentum*, silver, Fe from *ferrum*, iron, etc. The formula of a compound is made by writing the proper symbols in juxtaposition, so that NO means a compound of nitrogen and oxygen, HI a compound of hydrogen and iodine, and so on. When two elements form more than one compound, these are distinguished by subscript numerals, as in the examples PCl_3 and PCl_5 . In these substances one atom of phosphorus unites with three and five atoms of chlorine respectively. In every case the symbol of an element means one atom of the element, and therefore that relative quantity of it which is indicated by its atomic weight. In water, H_2O , two atoms of hydrogen weighing two units, combine with one atom of oxygen weighing in round numbers sixteen units; and thus the formula tells us in shorthand that the compound contains two parts of one element to sixteen of the other. No matter how complex a formula may be, this simple rule invariably applies, and by its means the composition of the substance represented can be calculated. The symbols, moreover, can be combined into equations, from which we may compute the outcome of a given chemical process. This subject, however, is much too abstruse for discussion here. Its details are developed logically from the atomic theory.

To the philosophers who preceded Dalton an atom was the smallest particle of any sub-

stance which could possibly exist. Thus water might be subdivided and subdivided until, in theory, a limit was attained, and an atom of water was the result. By chemical means a new order of divisibility had now to be recognized, and the supposed "atom" of water was itself found to be complex, and separable into still smaller particles of oxygen and hydrogen. The latter are the atoms of the chemist; the former clusters of atoms are known as *molecules*. This distinction was not developed immediately; its full recognition came slowly, and it derived its importance from certain laws relative to gases which were discovered, partly by Boyle, partly by Gay Lussac, and generalized in 1811 by Avogadro. Avogadro's law may be concisely stated as follows: Equal volumes of gases under like conditions of temperature and pressure, contain equal numbers of molecules. A molecule is now defined as the smallest particle of any substance which can separately exist; an atom as the smallest particle which can take part in chemical change. Another law, discovered by Dulong and Petit in 1819, was also highly important, for it was shown that the specific heat of an element was inversely proportional to its atomic weight. In other words, the elementary atoms have all the same capacity for heat, and this rule gave us an important check in ascertaining the true weights of the atoms. The law of Avogadro and the law of Dulong and Petit were brought together by Cannizzaro in 1858, and the system of atomic weights and chemical formulæ now in use, which differ in certain essential particulars from those that were first adopted, was the result of the combination.

In the early days of scientific chemistry the science was divided into two great sections, organic and inorganic, the one dealing with animal and vegetable products, the products of life, and the latter with substances derived from the mineral kingdom. Inorganic chemistry, the chemistry of the metals, the earths, the commoner oxides, bases, and salts, was for the time being the simpler, and during the first half of the 19th century it received the lion's share of attention. At first it was supposed that the two fields of research were absolutely distinct, and that no organic compound could be derived by artificial means from inorganic sources. This belief was overthrown by Woehler, in 1827, who showed that urea, an organic body, was easily prepared from inorganic ammonium cyanate, and since then a vast number of organic syntheses have been effected. Curiously enough, urea and ammonium cyanate, although very different substances, have the same percentage composition, containing the same elements in exactly the same proportions. Later it was found that *isomerism*, as this semi-identity is called, was exceedingly common, and here was a noteworthy phenomenon which called for explanation. Different molecules could be constructed from the same set of atoms, and the simplest interpretation of the fact was that the latter were differently arranged. Out of the same bricks different houses may be erected. The conception of *chemical structure*, therefore, came into being. What is the arrangement or grouping of the atoms within any given molecule?

The earlier attempts at the solution of this

CHEMISTRY

problem have now only historical interest, and their consideration is of value to professional students of chemistry alone. If we were to trace the successive stages we should find evidence of a systematic growth in chemical theory; but definiteness was hardly possible until after Cannizzaro had established the true system of atomic weights, and formulæ had been adjusted in accordance with them. Between 1850 and 1860, however, a new property of the atoms began to be recognized, and this, taken in connection with the formulæ based on Avogadro's law, was the key to the problem. The theory of *valence*, which is the expression of the newly discovered property, is as follows. Every atom, as regards its union with other atoms, has a certain atom-fixing power, which is known as its *valency*, or *valence*.

Let us take hydrogen as our standard of reference and consider some of its simplest compounds. In HCl, hydrochloric acid, one atom of hydrogen is united to one of chlorine. So also we have HBr, and HI, KCl, and NaCl, AgBr, etc. These elementary atoms, which combine only in the ratio of one to one, at least to form permanent compounds, are *univalent*, that is, their power of fixing or uniting with other atoms is unity. In water, on the other hand, H₂O, a single oxygen atom holds two of hydrogen in combination, and so oxygen is called a *bivalent* element. In H₂S, CaCl₂, ZnI₂, we have illustrations of still other compounds in which a bivalent atom is united with two of the univalent type. Nitrogen, phosphorus, arsenic, aluminum, and some other elements go still farther, and are *trivalent*, so that the compounds formed by them have such formulæ as NH₃, PH₃, AsH₃, AlCl₃, and so on. Carbon, a *quadrivalent* substance, forms normally compounds of still more complex type, such as CH₄, CCl₄, or, when it unites with two *dyad* or bivalent atoms, CO₂ and CS₂. For brevity, the valency of the various elementary atoms may be indicated by speaking of them as *monads*, *dyads*, *triads*, *tetrads*, etc. The rare metal vanadium is a *pentad*, having a valency of five, and *sexivalent* tungsten is a *hexad*. In many cases valency seems to be a variable property of the atom, as, for example, when we consider the two chlorides of phosphorus, PCl₃ and PCl₅. In cases like these the higher figure may be taken as showing the maximum atom fixing power of the element, a power which is only partially exercised in the lower compounds.

In the theory as thus stated there is no mere speculation; it is a statement of definitely observed facts. It tells us that the atoms unite, not arbitrarily, but in accordance with certain rules; and these help us in our comprehension of known compounds and the discovery of new ones. Indeed, an enormous advance in chemical discovery followed the application of these principles: an advance not only of scientific importance, but of economic and commercial value also. It was in the domain of organic chemistry that the growth became most immediately evident, and to this branch of the science we may now turn our attention. It is here that we find the best illustrations of what is meant by chemical constitution or structure, and the best examples of isomerism.

It has already been pointed out that organic chemistry, in its beginnings, dealt with animal

and vegetable substances, the products of living organisms. Other artificial bodies, derived from these, were also included in its territory. All organic compounds were characterized by the presence in them of carbon, this element being ordinarily combined with hydrogen, oxygen, nitrogen, or all three, and sometimes with other elements also. Organic chemistry, as its domain was enlarged, in time received a new definition, and to-day the term broadly signifies *the chemistry of carbon compounds*. It is true that some compounds, such as the metallic carbonates, are more conveniently described as inorganic in character; but these minor exceptions affect the definition but slightly.

At first sight the almost innumerable organic substances appear to be hopelessly complex, and some, indeed, such as albumen, are so; but a closer inspection reveals order among them, and, in general, an ultimate simplicity. Their great number is due to the fundamental properties of the carbon atom, which, being quadrivalent, can unite with four other atoms simultaneously; and which, moreover, may combine with other atoms of its own kind to form rings or chains that serve as nuclei for the development of long series of substances. Most of the latter are derived from *hydrocarbons*, compounds of carbon and hydrogen, and these are exceedingly numerous. Marsh gas or methane, CH₄, contains the largest proportion of hydrogen, and is the type upon which the quadrivalency of carbon is predicated; it is, furthermore, the first member of a series of hydrocarbons, CH₄, C₂H₆, C₃H₈, and so on up to C₂₅H₅₂, and perhaps even farther. In this series each compound contains one atom of carbon and two of hydrogen more than the hydrocarbon preceding it, and this regular difference establishes what is known as an *homologous* series. Nearly all organic substances can be arranged in series of this kind, so that the chemist is able to master a great number of details by a single effort of the memory. Moreover, the members of each homologous series vary regularly, step by step, in their physical properties. Thus CH₄ is a gas, C₂H₆ a heavier gas, C₃H₈ a volatile liquid, the following terms are liquids which grow less and less volatile, while above C₁₇H₃₆ the hydrocarbons are waxy solids. Ordinary paraffin is a mixture of these higher hydrocarbons, and the whole group, therefore, is known as the *paraffin* series. Common petroleum consists chiefly of its liquid members. From these hydrocarbons, with oxygen, a parallel series of *alcohols* is derived: such as CH₃O, methyl or wood alcohol, C₂H₅O, ethyl or ordinary alcohol, C₃H₇O, amyl alcohol or fusel oil, etc. By further oxidation the alcohols yield a set of acids, among which acetic acid, the acid of vinegar, is the one most familiarly known. This single series of hydrocarbons is the key to thousands of other substances which are directly producible from them. Some of these products illustrate very simply a mode of derivation which is known as *substitution*, as when, from CH₄, hydrogen atoms may be successively withdrawn and replaced by univalent atoms of chlorine. Thus we get the following compounds: CH₄, CH₃Cl, CH₂Cl₂, CHCl₃, and finally CCl₄; the fourth one being the familiar body chloroform. So also acetic acid, C₂H₄O₂, by substitution with chlorine, gives C₂H₃ClO₂, C₂H₂Cl₂O₂, and C₂HCl₃O₂; but here

CHEMISTRY

the process stops and cannot be carried further. The one remaining atom of hydrogen in acetic acid is differently combined from the others, and here we begin to see the sort of evidence by which differences of chemical structure may be determined. When we study great numbers of organic compounds, especially with regard to their possibilities of chemical change, we find that certain combined atoms behave differently from other combined atoms of like kind. We also discover groups of atoms which can be shifted collectively from compound to compound; clusters which act almost like elements and are perfectly definite in their nature. The group NH_4 is so much like a metal in its compounds that it is given a distinct name, *ammonium*, and is conventionally treated as if it were really a metallic body. CN , cyanogen, resembles chlorine in some of its relations, and such groups as CH_3 , methyl, and C_2H_5 , ethyl, are encountered at every turn. They do not exist separately, but only in combination, and are known as *compound radicles*. Every such radicle has valency, and this is essentially residual in its nature. Thus in methyl, CH_3 , three of the four units of affinity belonging to the carbon atom are satisfied by hydrogen, leaving one unit unemployed. Methyl, therefore, is a univalent radicle, and acts almost as if it were an independent element.

The chemical formulæ which we have so far considered belong to the class known as *empirical formula*; they give the number and kind of atoms in a molecule, but tell nothing as to their arrangement or mode of union. With the conception of valency and a knowledge of radicles we are now prepared to construct *rational* or *constitutional* formulæ, and from these it is possible to infer what sort of changes a given molecule can undergo, and to understand wherein isomeric bodies differ. For example, there are two bodies having the empirical formula $\text{C}_2\text{H}_6\text{O}$; one, methyl ether, is a gas; the other, common alcohol, is liquid; the great difference between them is evident at a glance. Their rational or structural formulæ exhibit the cause of difference as follows:

Methyl ether.

Ethyl alcohol.

In the first, two methyl groups appear united by an atom of oxygen; in the other, the carbon atoms are directly combined, and the bivalent oxygen connects carbon and hydrogen. The lines which connect the symbols represent units of valency, and the groups CH_3 in one case and C_2H_5 in the other stand for well-known radicles. For further illustration we may recur to the case of acetic acid, in which, as we have seen, three hydrogen atoms behave differently from the

fourth. This condition is shown in the following structural expression:

Here we see the three replaceable atoms directly connected with carbon, while the fourth is linked to oxygen; the latter element also being combined in two ways. The known facts are clearly and simply presented to the eye by a convenient symbolism, a method of formulation which has been of immense value as a guide to practical research. In order to succeed, an experiment upon any of these compounds must be in accord with the facts of molecular structure, for the latter indicate limitations which cannot be disregarded.

In two of the foregoing formulæ the linking of carbon with carbon is clearly indicated, but only by single units of valency, or *bonds* as they are sometimes called. In other cases, however, more complex unions occur, and double or triple linkages are common. The formulæ for two hydrocarbons may be cited to illustrate this principle, thus:

The second of these bodies is now widely known as an illuminating gas. Each compound is the starting point of an homologous series, exactly as with the paraffins; but the ethylene series exhibits a striking peculiarity. If we add to ethylene successive CH_2 groups, which characterize chemical homology, we get a sequence represented by such formulæ as C_2H_4 , C_3H_6 , C_4H_8 , and so on indefinitely. In all of these compounds the ratio between carbon and hydrogen is the same, and their percentage composition is identical; such a series is called *polymeric*. The different members of the series, however, yield different derivatives, and they are further distinguished from one another by their *molecular weights*, the weight of the molecule being the sum of the weights of the atoms contained in it. These molecular weights can be directly measured by ascertaining the actual weight of definite bulks of the several substances in the condition of gas or vapor. According to Avogadro's law, equal volumes of gases contain equal numbers of molecules; if, therefore, a litre of one gas is twice as heavy as a litre of another, the weight of its molecule must be double that of the latter. By experiment, then, we can determine the relative weights of molecules, and so discover whether a compound is formed from a larger or smaller group of atoms.

One other class of organic substances demands attention here, the so-called *aromatic bodies*, which start from the hydrocarbon C_6H_6 , benzene. In the compounds previously considered the carbon atoms are united in a chain-like manner, but in benzene there is good reason to assume that they form something like a ring. Around this ring of carbon atoms the hydrogen atoms are grouped, and by successively replacing them with other atoms or radicles, a myriad of substances may be generated.

CHEMISTRY

The details of this theory, which was put forth by Kekulé in 1866, are too abstruse for full development here, but its influence upon chemical research and chemical industry has been overwhelming. From benzene, which is a product of coal-tar, aniline is produced; and the derivatives of aniline give us a perfect rainbow of artificial dyes. To benzene, other hydrocarbons are closely related, and their derivatives are often curiously interesting. Among them we have artificial indigo and artificial alizarin, the latter being the coloring principle of madder. Both compounds are identical with the natural substances, and both are important commercial products. Medicines, like saccharin, antipyrin, acetanilid, and phenacetin; perfumes, like musk and violet; and flavoring substances, such as vanillin, are now prepared by synthesis from the hydrocarbons of coal-tar, and thousands of workmen find employment in the new industries which are based upon these processes. The investigations which created these new sources of wealth have been in great part guided by theoretical considerations, and at the very foundation of all this work we find the conception of chemical structure, and Kekulé's interpretation of the constitution of benzene. The atomic groupings represented by the structural or rational formulæ are not visionary, and their study has led to the greater material well-being of mankind.

It must not be supposed that the rational formulæ represent the arrangement of the atoms in space, for that is not their purpose. It is not likely that the atoms of a molecule all lie in one plane, and yet these formulæ suggest no other mode of grouping. The tridimensional structure of molecules is, generally speaking, almost entirely unknown; and yet, in certain cases, there are clues to a partial solution of the problem. Various organic substances have optical properties which are easiest explained by assuming that the atom of carbon is essentially a tetrahedron in form, and that its four valencies are forces exerted from the centre toward the four solid angles of the body. By means of this hypothesis many curious facts are interpreted, and many new discoveries have been made. Formulæ based upon the tetrahedral carbon atom are called *stereochemical* formulæ, and the study of their space relations is named *stereochemistry*. This subject is quite modern and does not admit of detailed discussion here.

That the elements are connected with one another by various relationships is a fact which was early recognized; they were therefore soon classified into groups according to their likenesses. Thus chlorine, bromine, and iodine are closely allied, and form strikingly similar compounds; lithium, sodium, and potassium resemble one another very clearly, and so too do the metals, calcium, strontium, and barium. Such a grouping was of great service in classifying many chemical facts, and in due time it was seen to be related to the property of valency. A general law connecting all the elements was, however, not discovered until the decade ending in 1870, during which time three investigators, Newlands, Mendeleëf, and Lothar Meyer, working independently, developed the *periodic system*. Upon arranging the elements in the order of their atomic weights, a regular periodic variation in their properties appeared, and the full-

est interpretation of it was due to Mendeleëf. The nature of his work may be partly shown as follows:

Beginning with lithium and arranging the elements in the order above indicated, a table of the following form can be constructed, although only three lines of it are given here:

I. Li.	II. Gl.	III. B.	IV. C.	V. N.	VI. O.	VII. F.	VIII. Ne.
7.	9.	10.9	11.9	13.93	15.88	18.9	19.9
Na. 22.88	Mg. 24.18	Al. 26.9	Si. 28.2	P. 30.8	S. 31.8	Cl. 35.2	A. 39.6
K. 38.9	Ca. 39.8	—	Ti. 47.7	V. 50.8	Cr. 51.7	Mn. 54.6	etc.

Under the symbol of each element its atomic weight is written, rounded-off, in some cases, for convenience. Let us now consider the first line. Lithium, which begins the scheme, is univalent, glucinum bivalent, and carbon quadrivalent, a regular increase in valency. Nitrogen is in its stablest compounds trivalent, oxygen bivalent, and fluorine univalent; thus showing a steady decrease. Neon, which was not known in Mendeleëf's time, and argon, which falls just below it, are elements of *no* valency, and these form no compounds. These elements, with their regular rise in valency to carbon and fall to neon, form a single period. In the next line, beginning with sodium (Na), the process is repeated; and this happens again in the third line; so that all of the elements in the same vertical column are alike in valency and intimately related in their properties and their compounds. Regular step-by-step variation horizontally, and likewise vertically, characterizes the table, which may, with certain qualifications, be extended so as to include all the elements known.

At the third place in the third line of the table, as given above, a blank appears. This place, when Mendeleëf developed his *periodic law*, was occupied by no known element; and in the fourth period of the completed scheme two similar gaps occurred. These indicated unknown elements, and Mendeleëf, from the properties of the adjacent elements, predicted what their properties should be. Since then the prediction has been verified; and three new metals, having all the properties which Mendeleëf foresaw, fill the vacant places. They are scandium, gallium, and germanium. The connection between the elements was more intimate than anyone had supposed, so much so that the unknown could be accurately prophesied. All physical properties appear to rise and fall from element to element in this regular periodic way; and we can now see what sort of elements are likely to be discovered in the future, and where they will stand in the tabular arrangement. The properties of an atom, thermal, electrical, optical, etc., seem to be in great measure dependent upon its weight. The distinctly chemical property of the atom, its valency, may be related to its form, as stereochemical evidence would seem to indicate; but here we have few facts to go upon, and speculation would be premature.

The wonderful regularities of the periodic law, with its verified predictions, lead us at once to reiterate the old question as to the ultimate nature of matter. Is it really various in kind, or is it at bottom only one? Are the elements, in the last analysis, elementary? To

CHEMISTRY

such questions no final answer can yet be given, but they cannot be silenced; and one of the most marvelous discoveries of science has some bearing upon the problem.

When a beam of white light passes through a glass prism, it is broken up into a bundle of rays which give to the eye the so-called seven primary colors. If this phenomenon be observed through the form of instrument called a *spectroscope*, a continuous band of color is seen ranging from red at one end to violet at the other. Suppose, now, that instead of examining white light, we repeat the experiment with a colored flame and see what will happen. Sodium compounds, for instance, when introduced into a non-luminous gas flame, give out an intense yellow light; and this, viewed through a spectroscope of low power yields a *spectrum* consisting of a single, narrow, yellow line. Lithium, under similar conditions, exhibits a red line; barium, a group of several green and yellow lines; and, in short, every substance which is capable of coloring a flame gives a spectrum which is not continuous. Each spectrum is made up of bright, colored lines, with dark spaces between; and every line is absolutely characteristic of its source. Every element, provided it be first heated hot enough to be converted into vapor, yields its own definite spectrum of one or many lines, which can be recognized in a spectroscope. The vapor of iron, as obtained in an electric spark between iron terminals, gives a spectrum containing a multitude of bright lines, and every one of them belongs only to iron. The process by which substances are thus identified is known as *spectrum analysis*; and it was discovered by Bunsen and Kirchhoff a little over 40 years ago. Bunsen applied the method to the analysis of the salts contained in a mineral water, and saw lines which belonged to no known element. He was thus led to find two new metals, rubidium and caesium, and soon afterward, by similar means, other chemists discovered thallium and indium.

Shortly after its invention the spectroscope was turned toward the heavenly bodies, in order to see what tales their light had to tell. It was at once found that they are all composed of matter like that with which we are familiar on the earth, although varying in complexity. The sun was proved to be an intensely heated body, containing a large number of our chemical elements in gaseous form, and the fixed stars were similar in character. The whiter and hotter stars contain comparatively few substances, the colored and cooler stars contain more. The nebulae, those bodies which represent the first step in the formation of planets and systems, were found to be vast clouds of incandescent gaseous matter, in which hydrogen and nitrogen predominated; chemically, therefore, they were extremely simple. From the simplest nebula to the complexity of our earth there was regular chemical gradation, suggesting that the evolution of the one from the other had been accompanied by an evolution of the so-called elements also. A strong argument in favor of the unity of matter was thus brought to light, even though absolute proof was wanting. The general opinion now is that our elements are really complex, al-

though our present resources are not adequate to decompose them.

Very recently this opinion has been strengthened by a group of remarkable discoveries connected with the rare metals, thorium and uranium. These elements and their compounds were found to emit invisible radiations, or emanations, which affect the photographic plate, and also possess certain measurable electric properties. This trait of *radioactivity*, as it is called, led to the discovery of two or three new metals, which are associated in the mineral kingdom with uranium, and one of these, radium, has the new power to an extraordinary degree. The radiations are of several kinds; and are still the subject of active investigation; but one or two of the conclusions so far reached are pertinent to the present discussion. In the case of thorium, according to Rutherford, the emanation consists of chemically inert gaseous particles which are continually being generated and given off from the parent material. The element thorium seems to contain something which is not thorium. So also J. J. Thomson, studying electrified gases, is led to the conclusion that the negative charge resides upon certain *corpuscles*, as he terms them, which are not more than the thousandth part of an atom of hydrogen in magnitude, and which are the same for all substances. Particles smaller than the chemical atom are thus being identified, and so the belief in the actual complexity of the elements is receiving close attention.

Although the principles of valency and the conception of chemical structure are best developed and exemplified in the study of organic compounds, the inorganic side of chemistry is by no means to be neglected. Here we find the simplest illustrations of chemical nomenclature, and some of the greatest fields of industrial activity. Sulphuric acid, soda, bleaching powder, and many other inorganic substances are of immense commercial importance; and the processes by which metals are extracted from their ores all fall within this department of chemistry. Information upon these practical subjects will be found elsewhere, under the proper headings, such as IRON; PHOSPHORUS; SALT; SODA; etc.; but a few general notions belong here.

The nomenclature of inorganic chemistry is quite simple. Compounds of two elements are described by giving their names and adding the termination *ide* to part of the second title. For example, copper unites with oxygen to form copper *oxide*; zinc and chlorine give zinc *chloride*, and so on, the names thus expressing the composition of the substances. When multiple proportions appear a numeral prefix is added to the class name, so that we have such combinations as iodine *monochloride*, ICl , iodine *trichloride*, ICl_3 , and the like. In some cases this mode of nomenclature is varied, as when certain well-defined classes of compounds are to be described. Thus we have the iron compounds FeCl_2 and FeCl_3 (the symbol Fe from ferrum), which are commonly called *ferrous* and *ferric* chloride respectively. The terminations *ous* and *ic* denote lower and higher stages of union and are used for convenience or euphony when the regular nomenclature might be awkward. Such compounds as PCl_3 and PCl_5 may be named either *phosphorous* and

CHEMISTRY

phosphoric chloride, or phosphorous trichloride and pentachloride, according to preference; but the latter form is the more precise and clear. Any compound of a metal with oxygen, then, is an *oxide*; with chlorine, a *chloride*; with sulphur, a *sulphide*, etc.

Three of the largest and most important classes of compounds are *acids*, *bases*, and *salts*. In order to define these rigorously, some previous knowledge of chemistry is required; but an indication of their character is easily given. The acids, as their name implies, are usually sour in taste, but not invariably so, and the stronger members of the class are violently corrosive and able to dissolve metals. They are most commonly derived from the non-metallic elements, and several acids may be formed from one of the latter. Here again we have the *ous* and *ic* nomenclature, as in sulphurous acid, H_2SO_3 , and sulphuric acid, H_2SO_4 ; the latter containing the higher proportion of oxygen. From nitrogen we get nitrous and nitric acids, HNO_2 and HNO_3 , and so on with simple descriptive names throughout the long list of these compounds.

The *bases* are the direct opposite of the acids in their properties, and have, when soluble in water, an alkaline or soapy taste. The taste of ordinary kitchen soda is a good example of this peculiarity. Certain vegetable coloring matters are changed in hue by acids and alkalies, the latter name being applied to the stronger soluble bases. Blue litmus, for instance, becomes red in contact with an acid, but an alkali restores its original tint. When acid and base are mingled in proper proportions, they *neutralize* each other, and a *salt* is produced which no longer affects litmus. To illustrate further: soda is a base, and when it is mixed with sulphuric acid it generates sodium *sulphate*. With sulphurous acid it yields sodium *sulphite*; and the two terminations *ate* and *ite* correspond to the other terminations *ous* and *ic*. Nitric acid, with bases, forms nitrates; acetic acid, acetates, etc., the nomenclature being simple and easy. Many of the salts are important commercial articles.

From one point of view an acid is a substance which contains hydrogen replaceable by a metal, and a salt is the compound so produced. Zinc, for instance, dissolves in sulphuric acid to form zinc sulphate, and free, gaseous hydrogen, is liberated. An acid, then, contains hydrogen plus something else, and the latter is a distinct radicle in each case which exhibits a definite valency. The subjoined formulæ may help to make this point clear:

<i>Nitric acid.</i> HNO_3	<i>Sulphuric acid.</i> H_2SO_4	<i>Phosphoric acid.</i> H_3PO_4
<i>Potassium nitrate.</i> KNO_3	<i>Potassium sulphate.</i> K_2SO_4	<i>Potassium phosphate.</i> K_3PO_4

That is, potassium (symbol K from kalium) replaces hydrogen atom for atom; and the radicles NO_3 , SO_4 , and PO_4 are univalent, bivalent, and trivalent respectively. A knowledge of these simple principles enables the chemist to classify the facts in his mind, and to write numberless formulæ without overloading his memory with details. Learning these principles is like learning a language, only the grammar is easy of

acquisition. Fluency in its use can only be gained by practice.

Between allied departments of science no sharp dividing line can be drawn, and this is peculiarly true with respect to chemistry and physics. The two sciences merge one into the other by imperceptible gradations, and neither can be fully understood separately. Physics treats primarily of the different forms of energy, light, heat, electricity, mechanical force, etc., and all of these appear in the phenomena of chemical change. Furthermore, chemical substances are described in physical terms, and are identified by physical properties such as weight, color, specific heat, melting point, boiling point, electrical conductivity, and the like. Considerations of this kind have received much attention during recent years, more than ever before; and so a great department of knowledge has been developed, known as *physical chemistry*. Avogadro's law, the periodic law, and the revelations of the spectroscope all fall partly within this field, but other important portions of it deserve some notice here.

Between chemical change and heat the relation is exceedingly intimate. No chemical change takes place without either the liberation or the absorption of heat, and every one is in some measure dependent upon temperature. At very low temperatures, like the temperature of liquid air, all chemical action ceases, and the most oppositely energetic substances lie side by side indifferent to one another. At very high temperatures all unions are broken up, and here again the chemical forces cease to be operative. Most of the changes which we observe are effected at ordinary temperatures, and a slight warming may rouse an apparently inert mixture to chemical activity. The application of heat, then, may either instigate or prevent chemical union, according to circumstances.

As a general rule, with some apparent exceptions, every chemical union develops heat and every decomposition absorbs it; and the study of these relations has received the special name of *thermochemistry*. Furthermore, every chemical change is attended by its own special, definite quantity of heat, and these quantities vary from substance to substance. Hydrogen, burning, that is, combining with oxygen, gives out the largest amount of heat of any substance known; carbon yields much less, phosphorus or sulphur less still, weight for weight being consumed. For such reasons the heat value of any fuel depends upon its chemical composition, and hence careful analyses of coal, which is a variable mixture containing chiefly carbon and hydrocarbons, have great practical importance. From the composition of a coal its *calorific value* may be calculated, although a direct experimental measurement of it is to be preferred. In general laws, however, thermochemistry is still rather deficient, and its larger meanings are yet to be discovered.

Like heat, radiant energy, the energy of light, may cause either chemical union or chemical decomposition. Hydrogen and chlorine, mingled in cold and darkness, do not readily unite, but upon sudden exposure to strong sunlight they combine with explosive violence. On the other hand, silver salts, under suitable conditions, are broken up by light, and upon this fact the art of photography is founded. The

CHEMISTRY

photographic film is a laboratory in which light is the chemist. We have already seen, in considering spectrum analysis, that every substance, when intensely heated in the form of gas or vapor, emits light which is peculiar to itself; but there are still other relations between matter and light that have chemical importance. Color is merely the capacity for selecting or absorbing certain rays, and rejecting or transmitting others; and this is often a characteristic distinction between various classes of compounds. For example, salts of cobalt are commonly red, of nickel green, of copper blue or green, and so on. Many of the optical properties of substances seem to depend upon their chemical composition, and in one set of phenomena this fact has economic importance. Certain bodies have the power of twisting or rotating a ray of polarized light, and among carbon compounds this property is directly connected with stereochemical structure. Sugar is one of these optically *active* compounds, and by measuring the amount of rotation which a sample can produce its degree of purity may be determined. This process is practically applied in all sugar refineries for estimating the value of raw sugars or syrups, and also in assessing customs duties. The polariscope used for such purposes is often called a saccharimeter.

Of late years chemistry has been greatly developed upon its electrical side, both theoretically and practically. Electricity may be generated by chemical change, and this happens in all forms of the galvanic battery. For many years, previous to the perfecting of the dynamo, batteries of that class supplied all the electrical power that had any industrial significance. Electricity may also produce chemical change, and it is especially effective in bringing about decompositions. Indeed, many thinkers have sought to identify chemical attraction or affinity with electricity, and even the property of valency is often ascribed to electrical charges carried by the atoms.

From a purely chemical point of view, probably the most important electrical phenomena are those of *electrolysis*. When a current of electricity passes through a compound solution, the latter undergoes decomposition, and the dissolved substance, acid, base, or salt, is separated into two parts which move with unequal velocities in opposite directions. The conducting liquid is called an *electrolyte*, and the separated parts, or rather particles of the compound in solution, are termed its *ions*. One ion is positively, the other negatively electrified, and hence they tend to accumulate around the opposite poles. Under suitable conditions, the separation can be made permanent, and this fact is the basis of all our processes in electrometallurgy. From solutions of gold, silver, copper, nickel, etc., the metal is electrically set free, to be deposited upon properly arranged surfaces. Electroplating and electrotyping are operations of this kind. In the electric furnace, however, the electricity acts as a source of heat, and the latter is the effective decomposing agent. In manufacturing chemical preparations many electrolytic processes are now employed. In liquids which do not conduct a current electrolysis does not take place.

Suppose, now, we employ several precisely similar currents to effect a variety of elec-

trolytic changes. Let one current liberate hydrogen from water, another deposit silver, another copper, and so on. Then, upon measuring the quantities of the different substances which have been set free, we shall find them to be exactly proportional to their *chemical equivalents*, an equivalent being the ratio between the atomic weight of an element and its valency. For univalent elements the atomic weights and equivalents are identical, for bivalent elements the equivalent is half the atomic weight, and so on through the list. If, then, one gram of hydrogen is liberated, the same current in the same time will deposit 107.11 grams of univalent silver, or one half of 63.1 grams of bivalent copper, etc. This fundamental proposition of electrolysis is known as Faraday's law. Furthermore, the separated ions all carry equal electrical charges per unit of valency, 96,500 coulombs for a univalent ion, and twice that for a bivalent ion. The relation between electrical and chemical phenomena is of the very closest kind, and Faraday's law is absolutely general.

When two or more substances act upon one another chemically, the entire process is termed a *reaction*. Very many of the reactions which are observed in the laboratory take place between bodies in solution, and hence the study of solutions has received and is still receiving a great deal of attention. No complete theory of solutions has so far been developed; why one substance should dissolve easily in water, another slightly, and a third not at all, remains unexplained; but some generalizations have been reached, and these are of the most suggestive character. Some of the phenomena are electrolytic in their nature, and others go to prove a remarkable parallelism between bodies in solution and bodies in the gaseous condition.

In Avogadro's law the volume of a gas is defined by conditions of temperature and pressure, and equal numbers of molecules occupy equal spaces. The power of exerting pressure is one of the distinct properties possessed by all gases, and this is a consequence of the fact that the molecules are in rapid and continuous motion. Substances in solution are also found to exert pressure, and the latter can be measured by various means. The pressure is proportional to the strength of the solution, and although it is not easily detected, it is often very great. The movement of the sap in a plant is due to the *osmotic pressure* of the dissolved substances that it contains. In 1887 Van t'Hoff, studying these phenomena, deduced from them the simple law that equal volumes of solutions, at equal osmotic pressures, contain equal numbers of molecules, and Avogadro's law was directly paralleled. A body in solution and a gas obey precisely similar laws. We have already seen that from the actual weight of a gas its molecular weight can be determined. Now, from the behavior of substances in solution their molecular weights can also be ascertained. A saline solution does not freeze so easily as pure water, and its boiling point is higher; the depression in one case and the elevation in the other being proportional to the molecular weight of the dissolved substance. These facts are directly connected with Van t'Hoff's generalization, and they are now of almost daily application in scientific research. The actual measurement of

CHEMISTRY

molecular weights has been enormously extended by means of the new laws.

Both gases and solutions, however, sometimes exhibit apparent anomalies. Certain compounds, when vaporized, seem not to agree with Avogadro's law, and such facts require explanation. The seemingly anomalous substances, as such, do not exist in the state of vapor, but are split up, or *dissociated*, into other things. For example, ammonium chloride, NH_4Cl , above a certain temperature, is decomposed into a mixture of two gases, hydrochloric acid and ammonia, $\text{NH}_3 + \text{HCl}$, which, on cooling, reunite and reproduce the original compound. Twice as much vapor as is required by theory, and specifically half as heavy, is produced by this transformation, which is but one of a large class, all well understood.

In the case of solutions it was found that many compounds, especially the acids, bases, and metallic salts, caused a lowering of the freezing point that was twice as great as should be expected. Here again a splitting up of molecules, a true dissociation, exactly like that observed in gases, had occurred. Furthermore, the anomalous compounds were all electrolytes; that is, their solutions conducted electricity and were electrolytically decomposed; while normal substances, like sugar, were not. Solutions, then, were to be divided into two classes, differing electrically, and also dissimilar in their relations to Van t'Hoff's law. The explanation of these differences is given by Arrhenius in his theory of *electrolytic dissociation*.

As interpreted by this theory, an electrolyte, when dissolved, is dissociated into its *ions*, partially in a strong solution, and entirely in one which is infinitely dilute; a statement which leads to some remarkable conclusions. For instance, the ions of common salt, sodium chloride, are atoms of sodium and chlorine. In a dilute solution the salt itself ceases to exist as such, while atoms of sodium and of chlorine wander about, chemically separated, but still in equilibrium with each other. Sodium sulphate may be regarded as made up of two parts, sodium ions and ions of an acid radicle, SO_4 , and these are severed apart during solution to move about independently. According to this view electrolysis is not primarily a decomposition of the salt: it is rather a sorting out of the already uncombined ions, which receive different electrical charges and concentrate separately at the two electrical poles. Some ions are single atoms, others are more or less complicated groups such as CO_3 , SO_4 , NO_3 , PO_4 , etc., which cannot be, or at least have not been, independently isolated.

In the study of chemical reactions the ionic theory of Arrhenius has been fruitfully applied. By means of it we are now able to better discriminate between acids and bases, and to interpret more rationally the phenomena of neutralization. Acids are all characterized by the presence in their solutions of hydrogen ions, single atoms with a univalent radicle two atoms for each bivalent radicle, etc. Thus in hydrochloric acid the ions are H and Cl ; in sulphuric acid 2H and SO_4 , and in phosphoric acid 3H and PO_4 . In bases, on the other hand, ions of *hydroxyl* exist, and this is a radicle of the formula HO , in which the bivalent oxygen is only half combined. Caustic soda, NaOH , for ex-

ample, dissociates in solution into the ions Na and HO ; caustic lime, CaO_2H_2 , into Ca and 2HO , and so on. When a dissolved base and a dissolved acid are brought together, the H ions of the latter and the HO ions of the former combine to form water, H_2O , and vanish from the reaction. The salt which is produced is represented by the remaining ions, and as the characteristic features of acid and base are gone, the result is neutral. Nearly all reactions in solution, but not quite all, are reactions between ions rather than between the actual compounds with which we originally began.

In the time of Lavoisier chemistry was hardly more than a minor subdivision of natural philosophy. It was just coming into recognition as a true science, and its votaries were few. Its great development has taken place in little more than a century, and now it touches many other branches of knowledge, affects all departments of industry, and gives employment to tens of thousands of men. In every part of it there is intense activity, and discovery follows discovery faster than they can be assimilated. Mineralogy is to all intents and purposes a branch of chemistry, for minerals are classified upon the basis of their chemical composition, and the first step toward the establishment of a new species is its chemical analysis. Physiology is in great part a chemical science; respiration, assimilation, and excretion are chemical processes; within the living organism, plant or animal, substances are undergoing transformations which only the chemist can follow or identify. The chemistry of vital processes, *biochemistry*, is almost a science by itself, so large is its field and so varied are the problems with which it has to deal. Medicine is indebted to chemistry for almost a new pharmacopoeia, for not only have new remedies been created, but in place of old drugs, crude and bulky, the compact and more elegant active principles are now employed. Anæsthetics, such as ether, chloroform, and nitrous oxide; hypnotics like chloral; the remedies derived from coal-tar; and alkaloids like quinine, morphine, and cocaine, are a few of the contributions with which chemistry has enriched medical practice. Even antiseptic surgery depends upon chemical preparations for its success.

The chemistry of agriculture is separately treated elsewhere, but a word may fairly be said upon the relations between chemical science and the arts. Every manufacturing industry is directly and profoundly affected by the results of chemical research. A century ago probably no manufacturing establishment in the world even thought of maintaining a chemical laboratory; to-day hundreds are in operation for the benefit of the intelligent manufacturer. Coal gas is a chemical product; its by-products are ammonia and coal-tar; and from the latter, as we have already seen, hundreds of useful substances, discovered within the last half century, are prepared. Better and cheaper soap and glass owe their existence to chemical improvements in the making of alkalies; chemical bleaching has replaced the slow action of sunlight and dew; chemical dyestuffs give our modern fabrics nearly all their hues. In metallurgy every metal is extracted from its ores by methods which rest on chemical foundations, and analyses of fuel, flux, and product go side by

CHEMISTRY IN HUMAN PROGRESS

side with the smelting. The cyanide and chlorination processes for gold, the Bessemer process for steel, are good examples of the advance in chemical metallurgy; but before they can be applied the dynamite of the miner, another chemical invention, must have done its work underground. Waste products are made useful, and new applications of old materials are discovered by the chemist; even curiosities like the rare mineral monazite are brought into play. Monazite furnishes the oxides of thorium and cerium, from which the mantles of the Welsbach burners are made. Every year brings its improvements, and chemical patents by the hundred are annually issued to inventors.

The facilities for chemical training have increased side by side with the demand for chemical services, and in every university or technical school chemistry has become a leading study. Even the preparatory schools are now equipped with chemical laboratories, and the science has come to be recognized as an important part of a liberal education. Apart from its practical bearings its disciplinary value is very great, and this consideration is now given due weight by teachers.

One more phase of chemical activity remains to be noticed, the organization of chemical societies. Of the larger national organizations the English society is the oldest, the French next, then comes the German, and then the American. The German society is the largest; but the American Chemical Society numbers over 2,200 members, and has sixteen local sections in continuous operation. In its journal it publishes over 1,500 octavo pages each year. There are also many smaller organizations devoted to chemistry, and some to special subdivisions of it, such as electrochemistry. Applied science is represented by the Society for Chemical Industry, an Anglo-American association of great strength.

F. W. CLARKE,

Chemist for U. S. Geological Survey.

Chemistry in Human Progress. Running over some of the great chemical developments to find a starting point, agriculture appears to be a good field to begin in. As agriculture is the oldest industry on the face of the earth, it is not strange that many facts should have been discovered during the centuries of its practice. But, before chemistry was developed, there could be no science of agriculture. What was known was purely empirical, and no reason could be assigned for the result. Many may be surprised to know that scientific agriculture

dates from 1862, 39 years ago, the date of the publication of Liebig's great work on 'The Chemical Process of Vegetable Nutrition and the Laws of Agriculture.' Liebig's first work appeared in 1840, and was met with a storm of abuse and criticism. But then the world usually treats a new idea in that way. Abuse by the world often means that one has evolved an idea having some claim to originality. It seemed particularly to vex the public that a chemist should meddle with agriculture, and dare to assail the views of practical farmers. The book went through many editions and then dropped out of notice, for, although founded on correct principles, Liebig had erred in his inferences, and his ideas when put into practice failed entirely. Liebig stated that the plant lived on, or assimilated, the simple or inorganic constituents of the soil and converted them into complicated organic substances such as cellulose, sugar, albumen, etc., and that the animals lived on the plant; that the plant built up complicated substances out of simple ones, and that the animal consumed these complex substances, and then converted them back into simple substances. In other words, the plant was a synthetic organism, and the animal an analytic. To establish this, and to found upon it a practical method of agriculture and physiology, was a work so colossal that it is no wonder that even the mighty intellect of Liebig should have failed at first to grasp all of the details. Liebig examined an immense number of plants from all parts of the world, and found that while the plants all contained the same ash constituents, different kinds contained different proportions of these mineral ingredients; even different parts of the same plant, as the leaves, the stalks or the seeds, contained varying relations of ash constituents. As a result, Liebig was able to state that every plant takes from the soil a certain amount of mineral substances as a definite mixture, and that these substances will be found again in the ash, and that the carbonic acid and ammonia which the plant requires to form its combustible parts are taken up through its leaves and roots from the atmosphere. If wheat, or corn, is grown on a field, year after year, in time the mineral food of the soil will become exhausted and the plants will not thrive, but will be dwarfed and puny and incapable of enduring the weather, or will die of starvation. Now, if the proper amount of mineral nutriment be added to the soil, the plants will grow, and the atmosphere and mechanical nature of the soil will look after the rest.

A factory was established to manufacture artificial fertilizers according to Liebig's idea, but after several years of trial it was found that they were a complete failure. Liebig knew that his theory was right, but was unable to explain why it failed in practice. He worked and thought, and thought and worked. After several years he noticed that certain fields which he had treated with his fertilizers, and which had not been bettered by them, began to show slight but marked and increasing signs of fertility. In the meantime, the English farmer, Lawes, working with a chemist named Gilbert, showed that fertilizers would produce effects if added in a soluble form, and further that ammonia and forms of nitrogen were not taken

CHEMISTRY IN HUMAN PROGRESS

up by the plants from the air alone, but that they must be added to the soil. If these conditions were followed, the yield of a field was enormously increased. Liebig had supposed that if his fertilizers were easily soluble in water they would soak through the earth before the plant could assimilate them, and had hence made them as difficultly soluble in water as he could. But Thompson and Way long ago proved that surface soil had the power to retain certain substances when in solution. The scales fell from Liebig's eyes. The mineral food of the plant must be placed on the soil in soluble form; the soil would hold it and the roots would absorb it. In 1862 appeared the new edition of his great work, and agriculture became a science. It was easy to find out what was the proper food of any plant, and no farm need suffer from exhaustion. Since then the progress in this branch of science has been so rapid that it is hard to follow it. The striking facts of this discovery have been merely touched upon; there are many minor ones, and the conditions necessary for the successful application of the results are numerous, but every day shows advance in our ability to understand and apply them.

What are the effects of this discovery upon civilization? We find that agriculture as a livelihood, indeed, as a profession, has enormously increased. The vast deposits of fossil bones, phosphate rock, and of guano have been opened, and have developed a great industry, as well as have increased the resources of the world many fold. Stations have been established in many places for the examination of fertilizers and the determination of their value by chemical analysis, and employ a small army of trained chemists. The education and protection of the farmer have become a matter of national importance. Instead of farming land until it is used up, or relying on an empirical rotation of crops, the nutrients taken from the soil are systematically put back. Careful study of the chemical composition of a plant and the effect of chemical fertilizers enable us to develop certain products formed by the plant. Thus the beet root, by careful treatment, has been compelled to produce a far greater amount of sugar than formerly, and Germany has been freed from her dependence on other countries for her supply of sugar. Certain substances have been found to increase the specific functions of a plant, and so a plant can be developed into leaves, roots, stalk, or seed. In fact, we are getting to be more and more masters of the vegetable kingdom, or in other words, we can make two or even ten spears of grass grow where there was but one, and each will be bigger than the original one.

No man who has brains and muscle, and who is not afraid of work, need ever starve in this country, where land is so plentiful. Let us note one fact here, which is often overlooked. The great wave of agricultural development has swept over the West and is rolling toward the Pacific. These pioneers skim the cream. When the soil gets exhausted they move on to new ground. This is not an entirely beneficial production. We are sending, it is true, vast amounts of grain and foodstuffs to Europe, and money is coming back, but in what proportion? The mineral ingredients of these breadstuffs

are lost to us, and soon we shall have to replace them, which will cost us more, perhaps, than we have received. In 1883 we exported:

Of wheat.....	\$120,000,000
Of corn.....	28,700,000
In all.....	\$148,700,000

The cost of production of this was \$60,400,000, so that one might think that there was a profit of \$88,300,000.

According to Prof. Voorhees, of the New Jersey Experiment Station, however, there were in this exported wheat and corn 70,000 tons of nitrogen, 40,000 tons of phosphoric acid, and 21,000 tons of potash, which are worth, at market rates, \$33,000,000. Hence our real profit is only \$55,300,000, and a corresponding decrease in the capital stock of the West. This amount in time must be replaced, or our soil will become exhausted. So long as we can draw on our native supplies, well and good, but the time may come when we may have to buy them back, and at an advanced price.

In a word, then, Liebig's great discovery has done much to develop the prosperity and independence of nations, for the independence of a nation will be based largely on how well it can feed its inhabitants, that is, its power of endurance. No better result of the wonders that scientific agriculture can accomplish may be seen than in the States of Connecticut and New Jersey. Look at the thousands of acres reclaimed from stone and sterility and now yielding bountiful crops under scientific treatment. Nor forget what honor is due to the men who, by dint of sheer persistence, grit and brains, introduced Liebig's work into this country, and who have educated the plain agricultural workers to such an extent that these States can compete with others better adapted by nature for agricultural production, who established the first agricultural stations, after which all of our others have been modeled, and to whom not only these States but our whole country owes a debt of millions of dollars, if prosperity can be repaid in cash. I mean Prof. Samuel W. Johnson, of New Haven, and Prof. George H. Cook, of New Brunswick.

Let us now look into the subject of livestock and see what chemistry has done there. Lavoisier had shown that animal warmth was due to processes of oxidation, a kind of burning of the carbonaceous and hydrogenous substances in the body, just as the heat of burning wood is caused by the oxidation of the carbon, its chemical union with oxygen. Dulong and Despretz proved that nine tenths of the heat produced in the body was owing to this cause. The heat of our bodies appears to be a kind of flameless fire. Bodily heat is very much like steam heat, and to produce it fuel must be constantly kept burning under what may be termed the boilers of our organisms.

In the subject of animal nutrition the mighty mind of Liebig again found a vast field to till. In many ways this was no new and untrodden ground. Physiologists had accumulated hundreds of interesting facts, but the great question, how is it that although the nutrition of the various animals is so different, the composition of their bodies is so nearly the same, had not been answered. The flesh of the ox, the bird, and the man is about the same thing. The

CHEMISTRY IN HUMAN PROGRESS

change of substance in a hungry herbivorous animal is about the same as in a carnivorous one. From the day of Hippocrates to 1840, this question had been becoming more clearly defined, but the answers to it were conflicting and unsatisfactory. Suddenly, like a flash of lightning, the darkness was dispelled. The essential facts had all been found, but a chemist was needed to translate and explain them. It was like the old story of the writing on the wall. It was there, but no one could read it. It would take me too far from my subject to attempt to explain the details of Liebig's views of physiological chemistry, to relate the fierce polemic wars waged on these questions; for the dictum of Ranke is as true in the history of science as in the history of nations: "All progress is through conflict." Suffice it to say that Liebig was the first to definitely assert that the animal must find the chief constituents of its blood, which form and nourish its whole body, ready formed in its food, and these substances originate and are found in the plants. Following this up, we find that the animal is a kind of chemical factory in which many chemical processes are carried out. The machinery belongs to physiology; the processes, however, are largely chemical.

Chemical statistics in relation to animal life were collated and increased. Animals were analyzed wholesale, and their chemical composition determined. For instance, Lawes and Gilbert found that the analysis of 348 whole sheep gave an average of 2.34 per cent of ash, 7.13 per cent of protein, 70.4 per cent of fat, and 20.1 per cent of water. All kinds of animals were examined, and the composition of entire specimens and of the various organs and fluids determined. Foods were examined chemically, and, in fact, not only the body of the animal, but all that went into it and came out of it was analyzed by the chemists. The result of all this was that chemists found the animal to be as susceptible of experiment as the plant. Live stock can now be fed, for instance, to make flesh, to make fat, to yield milk, to produce work, or to simply maintain life. The nutritive elements of food can be determined and their digestibility estimated. The economy of foods can be calculated, and, in fact, the whole subject of animal-raising has passed from empirical management to scientific organization, and in this field, too, the progress has been rapid, and is still wonderfully rapid.

The animal is now studied very much like a steam engine; in the one case we feed coal and get steam, power, or heat, in the other, we feed fodder and get milk, flesh, or power, as the case may be. A "ration" can now be made in which the digestible proteins, the fat and carbohydrates can be obtained from the most various sources, and the fluctuations of the markets taken advantage of to produce the raw materials. The nutritive value and digestibility are carefully adjusted, and, as a result, for instance, we are able to produce milk at a total expense of 2½ cents a quart. In this country the science of live-stock feeding is as yet in its infancy. We are, at least in the West, gathering the bloom of the land. Our cheap beef and our cheap corn can be produced only for a time. Sooner or later the riches taken from the soil must be put back again. It would be hard, indeed, to trace all the effects of these discov-

eries on the gradual progress of civilization. Cheaper food and more economical and profitable agriculture strengthen the great tap-root of all civilization and human relations on this earth.

As a result of all this great advance in our knowledge of scientific agriculture farming has become a profitable profession, and I predict that more and more we shall see educated young men entering it.

The chemical study of foods has been carried up to the feeding of men. Prof. Atwater, of Wesleyan College, has published the results of his investigation on the cost of supporting workmen, and finds that the amount of food necessary to support a man and enable him to do his daily work, can be obtained at a cost of 12 cents a day. For 45 cents a man can live sumptuously. When meals are provided for a number at once the cost is ridiculously small. It might be well for some of the knights of labor and serfs of capital to look into these matters. What a frightful waste there must be in our household economy of to-day.

What a future looms up in this field of study. Think of the suffering and want that this accurate chemical work will alleviate when it is understood and appreciated. The German government supplies the people in certain districts with plainly written tracts explaining what are the most valuable nutriment in foods and about what amount of each is needed to make a daily ration which shall neither want nor waste valuable substance. Our own government is doing the same. Chemical knowledge gives an enormous increase in the purchasing power of a country, and greatly ameliorates the environment by making it more favorable to the people.

In the days of old, people supposed that every object was a particular kind of matter. It is true that Aristotle believed in four elements, earth, air, fire, and water, but these were used largely in a figurative sense. Wood was a substance, so was coal, so was water, so was air. They were supposed to be different kinds of matter. As chemistry began to develop, during the last 100 years, it was found that all the different kinds of matter about us could be resolved into a certain number of simpler substances, and that these simple substances could not be further altered. They were hence called elements. So far, about 75 of these elements have been found. All of the material objects about us are compounds of these elements; some, of course, being very common, and others more or less rare. Oxygen, for instance, a colorless gas, but when in combination, giving rise to compounds of the most various properties, constituting one half of the earth's crust, nearly one quarter of the air, and about one half of clay, sand and limestone. At first, methods of ascertaining the percentage composition of substances were very crude, but during the last 50 years they have, by means of the exquisite delicacy of the chemical balance and our increased knowledge of the chemical behavior of substances, been brought to a very satisfactory state of exactness. A student can now analyze with ease substances that would have perplexed the professor of 50 years ago. Aside from the immense advance in our knowledge of chemical causes and effects made by this powerful lever placed at our disposal, the public has been afforded a most marked protection

CHEMISTRY IN HUMAN PROGRESS

against fraud and imposition. No matter how high-sounding and laudatory the announcement of certain articles may appear, the cold-blooded analysis of the chemist at once dispels the illusion. There is no lack of unscrupulous persons who take advantage of many a chemical discovery to fill their own pockets at the expense of the public. The extent to which adulteration is carried to-day cannot be conceived of by one who is not conversant with the results of the analysis of commercial articles. Indeed, the popular ignorance on this subject is astounding. The continual demand by the public for cheap articles drives the manufacturers to all sorts of ways and means to adulterate. To counteract this, boards of health are continually analyzing articles of food. But commercial articles, however, are, as a rule, examined only by those who know how a chemical analysis can protect the buyer. Some years ago New York paid \$10,000 a day for the water added to the milk sold in that city. In every city one will find many articles of daily use are systematically adulterated. The time will come when every city will have to have its board of public analysts, who shall analyze all articles free of charge. Such boards now exist in France and Germany, and the results of their work throws a sombre light on the strivings of human cupidity. Cream of tartar often contains as high as 80 per cent of adulteration, illuminating oils are not seldom about as safe as gunpowder, soaps may be one-half water, borax is sometimes mostly baking soda. In the matter of fertilizers, the State experiment stations examine free of charge all articles, and determine their true value, but hundreds of other articles should also be tested by the government that the public may be protected. Slowly but surely the keen weapon of chemical analysis is lopping off all these unsightly side-shoots of our civilization. As long as food and drink consist of chemical substances and so many of the articles bought and sold are chemical compounds, it should be known to what extent they are what they are claimed to be.

What is the effect of the increasing accuracy in chemical analysis upon our civilization? It places every article on its true basis of intrinsic worth. Metals, ores and articles of commerce, have a certain value depending on the nature and amount of their valuable constituents. This is determined by analysis, and business is at once placed upon a solid foundation, and insecurity in values ceases. Chemical analysis is the balance wheel of trade. It establishes responsibility. It says to the cheat, honored and respected though he may be in the community—and there are thousands of them—"Thou art the man." It compels accuracy of statement—rigid truth. There is no effervescent sentiment in a chemical analysis. It makes honesty compulsory. Articles of food and drink must be what they claim to be, no more, or less. A man who adulterates is a liar and a thief, if not also a coward. He may cause ruin, disaster and death. A man who buys adulterated articles is a fool. Chemical analysis is one of the greatest agents for the protection of a community that there is, and its power is increasing every day. Again note: Chemical analysis shows clearly which of several articles are the best. Then we buy the article that we know to be the best. And so chemical analysis, disclos-

ing to the world where true worth is to be found, develops countries and gives them resources which may enable them to compete with greater nations. It shows us the relations between the material objects about us, and our own relations to them. For instance, the atmosphere, which is necessary to our existence, is composed of oxygen and nitrogen. The oxygen is being continually consumed and appears again as carbonic acid, the results of fires, fermentation and the respiration of animals. The plants consume the carbonic acid and give back the oxygen again to a great extent. There are thousands of these agents at work to change the composition of the air. And yet its composition does not practically vary. Should it, however, then life would feel the change at once. An increase of the percentage of oxygen in the air we breathe would produce a marked effect upon us. It is wonderful that the balance of these conditions is kept in such equilibrium on such a scale.

And still again, chemical analysis showing how all the objects about us are composed of but a few different kinds of matter, how, indeed, we ourselves consist of little more than a dozen elementary forms of matter, compels us to gaze in bewilderment at the evolution of a universe, with its endless variety of detail, out of less than a hundred different kinds of matter.

For a number of years chemists have been laboring to produce substances and study their properties. In this way a vast number of compounds have been produced, and the list is now yearly added to at a rate that makes one's head ache. The chemist interests himself chiefly with their chemical and physical properties, and as to their proper position in the particular classes to which they belong. Thousands and thousands of such substances have been created, or discovered, by the chemist, and but a very small number of them have as yet been applied. The study of their physiological properties will afford work for a legion of physiologists. Take ether and chloroform as instances. How hard it is to imagine a time when anæsthesia was unknown. Think of being unable to overcome pain! Of course the introduction of these agents met with opposition. Some said it was wrong to prevent pain, as others thought it a sin to use an umbrella because the rain was intended to wet us, or to insure one's life because it was flying in the face of Providence. But in time the clouds of ignorance were dispelled and the world came to know one of the greatest blessings that science has bestowed upon humanity. The pain and suffering that these agents have saved humanity is incalculable. Operations, which years ago would have been regarded as madness, are now, by their use, of common occurrence. There are thousands of substances whose physiological properties have not yet been tested. It may be that among all these substances we may find ones that will directly affect each function and organ in our bodies. Physicians have as yet but barely entered this field of physiological research; and unfortunately their labors are hampered in certain places by the attacks of the so-called Bestarians, who would not permit vivisection. Strange how little compunction these people seem to feel in allowing the results obtained by vivisection to be applied in the treatment of their own families when sick. The law of

CHEMISTRY IN HUMAN PROGRESS

atonement is nowhere more strikingly exhibited than in scientific research. If certain diseases are to be controlled, their causes discovered, and stamped out, cats and dogs may have to be sacrificed. We may wish all of our friends, all the babies and all of the cats and dogs to live, but like many other things we would like to have, we may have to suffer disappointment. Perhaps, after all, the fair sex is responsible to some extent for the destruction of animals. Think of what an indiscriminate slaughter of birds is continually going on that our fair friends may be able to carry fragments of the remains on their heads. Even if the tortures ascribed to vivisection existed, they would pale beside the horrors that follow the sportsman. The animals and birds dying in fevered agony of peritonitis and being eaten alive by ants and beetles are fully as heart rending as anything that has been ascribed to vivisection by the wild-est imagination.

Look at the advance in our knowledge of the action of disinfectants. And here again, but an absurdly small number of the vast array of substances at our disposal have been tried. Many diseases are communicated by a kind of seeds, spores, or germs. If these seeds can be killed it is impossible for the disease to get a foothold. Just as when the seeds of a plant are killed they will not sprout. The following instance of what can be done in this direction is interesting.

Some years ago the whole city of Detroit was disinfected by Dr. Oscar W. Wight, health officer of that city. All the receiving basins, sewers, etc., were disinfected by copperas, and the atmosphere of the sewers was purified by hanging in the manholes iron pails filled with burning sulphur. In all, the amount of copperas used by officials and citizens was 280,000 pounds. The gaseous disinfection of the sewers requires about three tons of roll brimstone. The total expense for the complete disinfection of the sewers (75,000 pounds of copperas and 6,000 pounds of sulphur); was less than \$1,300.

After the first disinfection of the city, there followed a great abatement of diphtheria, and an almost entire cessation of scarlet fever. The second experiment was followed by an almost complete cessation of diphtheria. Some years ago I kept the gutters of New Brunswick, N. J., disinfected with a solution of bromine, and obtained a marked improvement in them. These facts make one stop and ponder. If, then, instead of spending the money of a community in supporting inefficient officials, ward heelers and political quacks, a portion of it were expended in the systematic purification of the town, the death rate would be decreased; there would be fewer little graves to dig. But think of the astonishment of even a not unusually common council if asked to appropriate, several times a year, a sum of money to buy materials to throw into the sewers. Diphtheria, scarlet fever, and, for all we know, many other diseases, are the punishment of infractions of laws ordained for our benefit. Official cupidity, negligence and ignorance mean more than bankrupt towns, business depression, and loss of confidence. They mean broken hearts and bleak graves. The money received from political deals, or from the sale of a vote, is but poor recompense for the loss of a child. The increase in personal responsibility caused by the increase

in scientific knowledge is a vast one. It will be the great lever of the future.

The time is fast coming when the good old-fashioned phrase "dispensation of Providence," as so often used, will have to be replaced by the more easily understood but less pleasant, although entirely synonymous words, "the effect of ignorance," or "the punishment of incapacity," or again "the result of neglect," or yet again, "the spew of dishonesty." In fact, the object lessons of nature are so plain that a philosopher might think them to have been especially designed for the intelligence of an average politician. Take, for instance, the cases at Plymouth. The discharges of a typhoid patient were thrown into a brook, and the brook ran into the reservoir of the town. Soon there were 2,000 cases of typhoid. About the same thing occurred in the village of Lausanne, Switzerland. Such are the object lessons of nature.

As chemical knowledge advances and chemists analyze minerals and the substances found in plants and animals, determining their relations and properties, classification of many compounds becomes possible. Many substances, exclusive of those found in animals, have been produced by the chemist. Thus ordinary salt is the same substance, whether extracted from seawater or produced by mixing muriatic acid and soda. But the substances found in animals, that is in organized objects, while they were analyzed and their composition accurately determined, were supposed to owe their formation to the action of some mysterious vital power, usually called "vital force." It was assumed, with really no other apparent reason than it had not yet been done, that it could not be possible to make an organic substance artificially. The animal by reason of its mysterious, inherent vital forces must do that.

There is a certain compound called urea which is formed in the animal system, and which in many ways is of extreme importance. It was described in 1773 by Rouelle, and determined in 1790 by Fourcroy and Vauquelin. In every way it was then considered as an organic substance par excellence. In 1828 the great master, Woehler, of Göttingen, made urea artificially by heating ammonium cyanate, and the vast field of organic chemistry was opened to investigators. In 1832 Liebig and Woehler published the results of their labors on benzoic acid and the oil of bitter almonds, letting in a flood of light upon the subject of chemical constitution. The great Berzelius in his excitement proposes to call the new radical "pröin," from *Proi*, the beginning of the day. Since this time, the truly marvelous structure of organic chemistry has grown at a rate unequaled in the history of the development of any science. I wish there were some way of explaining organic chemistry to the general reader, for it is a wonderfully interesting subject. We can appreciate its results although unable in all cases to follow the methods by which they are obtained.

There have been so many remarkable victories achieved in the field of organic chemistry that it is hard to decide which to mention. Prominent among them are aniline colors. A more uninviting substance than coal-tar is not often found, yet in the hands of the chemist it has yielded compounds which, by profound study and skilful manipulation, supply the world with colors surpassing in beauty anything

CHEMISTRY IN HUMAN PROGRESS

produced by nature. In a few years a great industry has sprung up, employing thousands of men and an enormous capital; and all this founded on a waste product which manufacturers were once at their wits' end to find means to dispose of.

And, then, to what an extent is the fair sex indebted to the humble chemist! We have given them the wonderful aniline colors, which would put Solomon in all his glory to shame, and compel the peacock to hide his head and his tail in bedazzled desuetude. We can make velvet out of cotton and sealskin out of silk. We can supply perfumes surpassing the distilled refinements of the spices of Araby. We can make artificial blushes, heart palpitations, inflated rubber bosoms, and alabaster complexions. We can make imitation feathers, or whole birds if necessary, as well as all kinds of floral and animal remnants for personal decoration. We can change raven locks to tresses of glinting gold, or *vice versa*. We can supply eyes of any shade of color, as well as any number or kind of teeth. In fact the chemist is to the girl of the epoch what the lamp was to Aladdin—only more so.

Indeed, many of our so-called necessities of life are of quite recent introduction. Sugar, for instance, as late as 150 A.D. was prescribed by Galen as a medicine, and in 1455 was still a rarity. In 1775 all England consumed only 20,000,000 pounds in the course of the year against 20,000,000 hundred weight in 1885. And now comes the new sweet substance, saccharine, which is so sweet that a pinch of it will sweeten a barrel of water.

It is strange to note what a power may be exerted by a chemist working in some small and but little known laboratory. Graebe and Liebermann undertook the study of alizarine, the coloring matter of madder, and soon found out its chemical nature, and were able to produce it artificially from a substance found in coal-tar. A manufacture was founded and madder growing is slowly but surely dying out. Lately Baeyer has untangled the complications of indigo blue, and it is now but a matter of time when indigo growing will cease to be an industry. Salicylic acid, formerly a rare and costly product, has become an article of commerce, through the labors of Kolbe, who showed how it could be made cheaply from carbolic acid. And now a nation can send its armies out to battle in a region where rheumatic complaints would cripple them and leave them helpless at the mercy of their foes, had they not this power at their control to subdue these diseases. It is true, the diplomat utilizes to their full worth the powers at his disposal, but it must not be overlooked that the chemist furnishes him with many of his most efficacious agents.

I could go on with a long list of triumphs in organic chemistry and show how much we are indebted to the labors of certain diligent investigators in this field. In the matter of the processes of digestion our knowledge of organic chemistry has enabled us to make important progress in the last years. We are now able to produce many new and valuable forms of food, especially for children and invalids. Thousands of lives are saved every day by the use of chemical foods, and the application of chemical discoveries.

Let us glance for a moment at iron and steel. If iron contains even very small amounts

of certain substances, as phosphorus, for instance, it has but little value, for its properties are injured. Within a few years a young English chemist after patient experiments discovered a method by which the phosphorus could be easily removed from iron. This appears to be a simple matter, yet how much it means. Immense deposits of iron ore which could not be used because they contained phosphorus became at once of value. The material wealth of the country was immensely increased. The uses of iron and the simplicity of its production were increased. It has been well said that this untitled, almost unknown young man (Walter Weldon, q.v.), has done as much or more for England than all her kings, queens, and aristocracy put together have accomplished for her.

And again, now that we are coming to live in an age of steel, note that steel is a chemical industry. To make steel, we must decarbonize iron to a certain point, and to do this economically Bessemer introduced a method which revolutionized the whole industry. Can any one tell what the debt of the world is to cheap steel? Any one who will bear it in mind will find himself giving hundreds of answers to it. Try to trace out for how many of what are called the necessities of daily life we are indebted to cheap steel, and one cannot but be surprised.

The subject of the metals in general is worth attention. Chemistry has brought our means of extracting them from their ores and their subsequent refinement to a remarkable degree of perfection. We have numerous alloys which are of daily service, as phosphorus-bronze, friction-metal, gun-metal, and a thousand other useful inventions, all tending to cheapen articles and, indeed, in many cases to beautify common objects. Compare the doorknobs and hinges tastefully made of bronze with the common ones in use only 20 years ago. This all means the art education of the people, and we must never underestimate the power of this. And now we have cheap aluminum. It looks as if this may be the metal of the future. Brilliant, wonderful in its many properties, and more remarkable still in the fact that every clay-bed is a mine of it. How irritating this has been to chemists for years can well be imagined. Incalculable stores of this beautiful metal all about us and no means to extract it. If aluminum can be modified as iron now is, and given the properties akin to wrought iron and steel, then the future will be the age of aluminum.

If one were to ask how the state of civilization of a country should be judged one would probably be told how many churches there were, attention would be drawn to the volume of business done, the fine hospitals, the excellence of the police, the commodious jail, the tax rate and many other prominent features of the place. The chemist, however, would simply determine the amount of sulphuric acid used, directly or indirectly. In other words, almost all of the articles we use involve either directly or indirectly in their manufacture the use of sulphuric acid. This manufacture is carried on a scale so vast that a fair idea can hardly be given of it. Every detail has been studied and studied by scores of chemists. Each reduction in the cost of making it has cheapened thousands of articles. In the manufacture of bleaching powder

CHEMISTRY IN HUMAN PROGRESS

there was once a great waste. The acute mind of Walter Weldon turned this loss into a source of profit and the price of chloride of lime was reduced. Every time that we buy a piece of white paper and admire its whiteness and cheapness, we must remember that we are indebted to Walter Weldon.

Indeed, in the matter of paper, note how striking has been the progress. Cheap paper means cheap books, cheap newspapers, cheap knowledge, education of the public. Good paper means preserved eyesight. I need not say that paper is really a chemical manufacture. But little progress would be made in turning wood into paper without the chemist. And note again the future of paper. We have paper car wheels, paper gas pipes, paper water pipes, paper pails, paper stoves, paper chimneys, paper boats, paper forts, etc., etc.

One of the very important results of the study of chemistry has been the gradual change of empirical and wasteful processes of manufacture into rational and profitable methods. Every year shows progress in increasing the yields of manufactured products, and also increase in purity. Wastes are utilized, manufacturing costs are decreased, labor is made more efficient, trade expands and profits increase.

In 1739 Dr. Clayton, dean of Kildare, first distilled coal. But it was the end of the century before gas was practically introduced as an illuminating agent. Imagine one's sensation on first being asked to put a network of piping into one's house to convey a combustible and poisonous gas. The joints might not be tight, the cocks might leak; we might be poisoned by the thoughtlessness of any one who might not shut them off, or, indeed, the house might be blown to bits should the gas escape and ignite after it had become mixed with air. Yet it does not worry us now, even though all these things do come to pass not infrequently. From Dr. Clayton's experiments has arisen a vast industry with complicated side branches. Gas, coke, colors, medicines, disinfectants, delicate flavoring essences and a host of other inventions have followed in a steady stream. There has been no end to the discoveries in this field. In Europe gas has become almost a waste product, so valuable have its by-products become.

The invention of artificial light has extended the available term of man's life; by giving the night to his use it has, by the social intercourse it encourages, polished his manners and refined his tastes, perhaps as much as anything has aided in his intellectual progress.

It is very interesting to trace the development of many manufactures, as for instance the introduction and perfection of glass-making, which allows us to avail ourselves of the best medicine there is, sunshine. What a world of happiness lies in that word "sunshine!" Disease germs are paralyzed by it. Plenty of it prevents dark deeds. If we ever feel like being thankful, let us remember the abundance of windows in our houses, and that our little ones can play in the sunshine, and that we can have sunshine in our houses free of cost and without tax. How little one realizes the convenience in the use of glass and china articles. That hard, smooth surface which can be so readily cleansed, and which makes our tables so attractive and our food so palatable. We shall find that much of our pleasure, and, indeed, a good deal of our

health, is dependent on glass and porcelain. The chemist has done hard work for us on these articles, for there have been many neat chemical problems involved. We can now give glass some valuable properties. We make wool of it, spin it into yarn and weave wonderful dresses of it; make wigs of it, cover steam pipes and fill floors with it, make railroad sleepers out of it. Perhaps, in time, we shall be able to turn it on a lathe, or even to live in a glass house without fear. Who knows? Does not the illustrious Hofmann say, "With the gods and the chemist all things are possible"?

There are many interesting applications of chemistry which have been forceful factors in the development of civilization. The manufacture of soap, for instance, the use of which has also been taken as an index of civilization, has been immensely improved by the labors of the chemist, and it would be easy to trace the beneficial effects of it on the health of a nation. It is true that we have not the public baths of the Romans, or places where all the poor may bathe, but we have the next best thing—cheap soap.

Then there are remarkable chemical improvements in the arts of dyeing and printing textiles, by which good clothing has been made accessible to the poorer classes. Cleanliness and good clothing are no small factors in civilization. There have been astonishing discoveries in the field of fermentation, the middle ground between biology and chemistry, from which our ideas about disease germs and ptomaine poisons have arisen, and due to which treatment of many diseases has been radically altered for the better. In fact, the whole of antiseptic surgery, which allows of operations never dreamed of in past years, has become not only possible but of daily occurrence. Thousands and thousands of useful lives have been saved by the application of these discoveries.

And so our increasing knowledge of the relations of things will enable us in time to prevent disease. The average death rate in our cities is far too high. The average duration of life is about ten years too short. There are over 100,000 unnecessary deaths every year in the United States. In time we shall see more of true death, Euthanasia, or old age. How well Richardson describes this: "Without pain, anger, or sorrow, the intellectual faculties of the fated man lose their brightness. Ambition ceases or sinks into desire for repose; ideas of time, of space, of duty, languidly pass away. To sleep and not to dream is the pressing, and step by step, and still pressing need, until at length it whiles nearly all the hours. The awakenings are shorter and shorter, painless, careless, happy awakenings to him of a busy world, to the merry sounds of children at play, to the sounds of voices offering aid, to the efforts of talking on simple topics and recalling events that have dwelt longest on the memory, and then again the overpowering sleep. Thus on and on, until at length the animal nature is lost; the intuitive and merely animal functions now no longer required to sustain the higher faculties, in their turn, succumb and fall into inertia. This is death by nature, and when mankind has learned the truth, when the time shall come—as come it will—that 'there shall be no more an infant of days, nor an old man who hath not filled his days,' this act of death

now, as a rule, so dreaded because so premature, shall, arriving only at its appointed hour, suggest no terror, inflict no agony."

Chemistry has even dared to make the study of life a matter of investigation. Dr. Oscar Loew has indicated that in live albumen there is an atomic complex known as the aldehyde group, and in dead albumen it is not present. A striking inference of this fact is that substances which are known to have an energetic action on the aldehyde group exert also an intensely poisonous action on living protoplasm, and certain substances have on this induction been examined and really found to be violent poisons. Could we reconstruct the aldehyde group in a dead protoplasm? And if so would the protoplasm again be alive? Who can say? It is a mysterious subject and the discoveries but make it more mysterious. But then it is darkest before daybreak.

Even such a little matter as a match represents quite a number of chemical phenomena and ingenious applications of chemical discoveries. It is curious to think of what added power has been given to man by his ability to make fire so easily. The idea of fire leads me to speak of explosives, for there are some very interesting facts to be derived from the study of this subject. If we had time to investigate the effects of gunpowder in history we should note some striking results. Ancient history is largely a history of war. Disputes were settled by force of arms—physical force. Rulers ruled by force. Blood flowed on slight provocation. Might, not right, was the rule. Weapons were of the crudest kind, and wars often lasted for years. Later on the ruling classes clad themselves in armor and then as McElroy has so well explained in his article on 'The Musket as a Social Force,' for many years the world was at the mercy of the 'Man on Horseback.' He was invulnerable in his armor, and with sword and spear tyrannized, brutalized and slaughtered as his humor struck him. The serfs fared badly in the early days. In the "war of the Jacquerie," in 1348, there was an exciting serf-hunt conducted in one of the French towns, and after three weeks over 20,000 miserable men were run to earth and killed. The man who could strike the heaviest blow was ruler in those days.

Then in the 14th century someone invented gunpowder, and then a queer sort of gun, a kind of two-inch gaspipe with a touchhole. This gun was fastened to a stick, which one man held, while a second applied the fire. The ball weighed a pound and traveled scarcely 200 feet, so weak was the powder. Crude as the whole contrivance was, and tedious as it was to fire off, it curled up the man on horseback in the dust and left him a waste product on the land. Those who had robbed the farmer of the fruits of his hard labors, now went to fertilize the crops, a most admirable adjustment of nature, even though it was somewhat belated. Soon gunpowder and the gun were improved, and by their aid the robbed man "re-clothed himself with the rights that had been torn from him by a thousand years of the despotism of the 'Man on Horseback!'"

During the last 50 years explosives have been brought to a high state of perfection. Chemistry has placed in the hands of men agents that are so powerful that they cannot

be resisted. Trace the progress of a nation by the record of its conquests, and note how chemistry has given it, perhaps, the majority of its tools, its explosives, its system of feeding, its medicines, and so on through a long list. It will not be long before war will be impossible; in fact all conflicts impossible. The dynamite gun will blow a fort to dust, the submarine boat or the electric torpedo, guided by an unseen hand miles away, will send a ship into the clouds. The balloon, dropping explosives and inflammables, will wipe a city from the face of the earth as a child rubs a picture from the face of a slate. An explosive shell, filled with the proper chemicals, will poison a whole army. The prick of a needle, coated with virus, will sow incurable disease, and you may select from a catalogue nauseatingly long. A gill of typhoid germs dropped into the water reservoir of an ordinary town will leave few to tell of the horrors that followed. War will in time mean simply extermination of both parties. Pure arbitration, intellectual investigation of the question, the discovery of the principles and laws involved in the matter, and careful adjustment must come in time. Oppression, tyranny, and bossism are to pass away. Knowledge is the possession of humanity, not of the rich alone, or of the powerful, but it is to be the birth-right of the citizen. An irresistible power has been placed in the hands of the oppressed. First we have the slave, then the serf, now it is the wage-worker, the laborer. The capitalist has money, the laborer has dynamite. It is about as hard to know what to do with one as with the other. Neither can ever rule, and this phase, like the preceding ones, will slowly pass away. Any attempt to control others selfishly and wrongfully will be defeated by the irresistible power of knowledge of right.

Look abroad and notice how much nations take from each other without fighting. They slap each other's face and call each other bad names, but they don't fight. It is true that they support immense armies and armaments, but the time is coming when these armaments will cost so much for their support that to avoid bankruptcy they must be given up. The swords must be turned into plowshares and the men must go to work to aid in supporting instead of being supported by others. A peace of nations, a bankruptcy of nations, or an extermination of nations are the three alternatives to-day for Europe. So much Bismarck saw.

Force being neutralized, the conflict is to be one of intellect, reasoning based on an exact knowledge of facts. Physical force is already at a considerable discount. Educated brains are the important factors of success to-day.

PETER T. AUSTEN,

Late Professor Chemistry Rutgers College.

Chem'itype, a term used in engraving to include various relief processes by which a drawing or impression from an engraved plate may be produced in relief to fit it for printing on an ordinary printing press.

Chemnitz, kēm'nīts, or **Kemnitz**, Martin, German Protestant theologian: b. Treuenbrietzen, Brandenburg, 9 Nov. 1522; d. Brunswick 8 April 1586. He was the son of poor parents; received his education at Magdeburg and Frankfurt on the Oder, and in 1544, to obtain the means of continuing his studies at Wittenberg,

CHEMNITZ — CHEMUNG

became a schoolmaster in Wriezen. In 1550 he became librarian to Duke Albert of Prussia. He then wrote his 'Loci Theologici,' a valuable commentary on Melancthon's system of dogmatics. Being invited to Brunswick, as minister, he attacked the Jesuits in his 'Theologiae Jesuitarum Præcipua Capita' (1562), and, when the Council of Trent thought itself assailed in this work, he wrote his 'Examen Concilii Tridentini,' a work of great historical value. He gradually became attached to the Lutheran doctrines as distinguished from those of Melancthon.

Chemnitz, Saxony, a town at the base of the Erzgebirge, and at the confluence of the Chemnitz River with three other streams, 51 miles south-southeast of Leipzig. It is the principal manufacturing town of the kingdom—the "Saxon Manchester" its townfolk call it—its industry consisting in weaving cottons, woolens, and silks, and in printing calicoes, chiefly for German consumption. It supplies the world with cheap hosiery, and makes mixed fabrics of wool, cotton, and jute for the markets of Europe and the United States. It has several extensive machine-factories, producing locomotives and other steam-engines, with machinery for flax and wool spinning, weaving, and mining industry. Created a free imperial city as early as 1125, Chemnitz suffered much during the Thirty Years' war. Pop (1900) 206,584.

Chemnitzia, kēm-nīt'sē-a (named after Chemnitz, a distinguished conchologist of Nuremberg), a genus of gasteropodous mollusks, family *Pyramidellidae*. The shell, which is slender, is many-whorled with a simple aperture closed by a horny subspiral operculum. The animal has a very short head, with a long proboscis. Recent species 32; fossil 240, from the Silurian Period onward.

Chemosh, kēm-mōsh, the national god of the Moabites, who were on that account called "the people of Chemosh" (Num. xxi. 29; Jer. xlviii. 46). In Judg. xi. 24 Chemosh is mentioned as the god of the Ammonites, but the whole narrative here applies to Moab, and not to Ammon. Milcom was the national deity of the Ammonites. The Moabite Stone was erected to commemorate victories achieved by the aid of Chemosh. In the inscription upon it Ashtar-Chemosh is mentioned, apparently a goddess associated with Chemosh. Human sacrifices seem to have been occasionally offered up to Chemosh (2 Kings iii. 26, 27). The worship of Chemosh was introduced among the Hebrews by Solomon, who "built an high place for Chemosh, the abomination of Moab, in the hill that is before Jerusalem" (1 Kings xi. 7). Some have identified Chemosh with the sun, others with Saturn, while still others have regarded him as a war-god.

Chemotropism, kē-mōt'rō-pism, orientation (q.v.) by diffusing molecules, as where animals are attracted to their food by the sense of smell. Odoriferous particles are diffused or radiate from a centre; chemotropism is thus analogous to heliotropism (q.v.). The chemical effects of the diffusing molecules on certain elements of the skin, says Loeb, influence the tension of the muscles, just as the rays of light influence the tension of the muscles on heliotropic animals. Thus maggots of flies are positively chemotropic toward certain chemical

substances which are formed, for instance, in decaying meat and cheese. The blow-fly (q.v.) has the same positive chemotropism for these substances as its larva, and is accordingly led to the meat. This explains the instinct of the blow-fly and similar insects, which compels them to lay their eggs on the food appropriate for their young, neither experience nor will playing any part in their processes. Consult: Loeb, 'Comparative Physiology of the Brain and Comparative Psychology.'

Chemulpo, chē-mŭl'pō, Corea, a town on the western coast, 25 miles by road west-southwest of the capital, Seoul. It is one of the three treaty ports opened in 1883 to foreign commerce, the volume of which has since steadily advanced, in spite of the drawbacks resulting from the great difference between high and low water here (33 feet), and the want of wharves. The imports attain a value of \$3,500,000 in some years; the exports, \$1,500,000. The chief imports are cotton and woolen goods, railway machinery, metals, oils, and timber; the chief exports are rice, beans, millet, ginseng, and cowhides. The majority of the 3,000 foreigners are Japanese. Small steamers owned by Japanese run to Seoul in summer, and Chemulpo is connected by telegraph both with China and Japan.

Chemung, shē-mŭng', **Battle of the**, in the Revolution, 29 Aug. 1779, the decisive engagement of Sullivan's campaign (q.v.), to harry the Iroquois country. The Indians and their Tory allies made a stand in force at the Chemung River, about a mile southeast of Newtown (Elmira), N. Y. They had five companies of British troops and rangers, numbering about 250; and the entire fighting strength of the Six Nations. These Indians the Tory authorities state as 550; but this seems impossibly small, and Sullivan and his officers, from a careful estimate of various factors, place it at 1,200 or 1,300. Sullivan had about 5,000. The Indians were led by their Napoleon, Brant (Thayendanega); the Tories by Col. John Butler, with Sir John Johnson, and perhaps Guy Johnson. Major Walter N. Butler, and Capt. MacDonald. Their line was in advance of the river, resting on a bend at the right. From the bend ran a breastwork half a mile long, flanked by bastions and having a dwelling in front turned into a blockhouse; it was concealed by a mass of pines and scrub-oaks, some of them cut from other places and stuck down to make a seemingly thick virgin forest. From their left a thin line was continued about a mile and a half to a steep ridge parallel to the river, where a strong detachment was posted; and a mile further east was another ridge parallel to the first, with a breastwork and another company, the two advance detachments designed to take the Americans in flank and rear. Along the front of the main breastwork ran the road to Newtown, exposing the whole American flank to a raking fire. The entire works formed a magnificent ambuscade; but Sullivan, who was no Braddock, guessed the utility of the ridges, and knew what scouting parties were for. About 11 A.M. of the 29th Major Poor beat up the position; and Gen. Hand formed his infantry in a wood 400 yards from the works and waited for the rest of the army. Sullivan ordered Poor to carry the hill at his right and take the British in rear, while the main body with artillery attacked the front

CHEMUNG SERIES — CHENEY

Steadied by Brant, a warrior of great force and sagacity, the Indians not only made a stubborn resistance for two hours, yielding inch by inch, but even stood up against the bayonet, something almost unknown in Indian history. At first thrown into a panic by the artillery, Brant rallied them to a fresh and tenacious fight; and noting Poor's turning movement, threw a strong detachment with a battalion of rangers to the hill to oppose it. But at length Poor, having cleared the crest, burst on the rear with a bayonet charge; and both Indians and whites fled across the river in rout, the Indians leaving their packs and weapons behind, and eleven dead, though they usually carry all these away with them. Fourteen other dead Indians were in fact found under the leaves, two canoes were found covered with blood, and the Indians told their western villages that they had many killed and vast numbers wounded. The Americans had six killed and 40 or 50 wounded.

Chemung Series, in American geology, the great series of shoal-water sediments, mostly light gray shales and ripple-marked sandstones, that were laid down in Upper Devonian time in the great northeastern bay of the interior sea that covered much of what is now the Mississippi valley. This northeastern bay stretched across lower Michigan, Ontario, and central New York, reaching nearly to the Hudson River. The Chemung Series includes the Catskill Group and is divided into the Chemung and Portage Stages. It is typically developed on the Chemung River in New York. It reaches its maximum thickness of 8,000 feet in eastern Pennsylvania, but thins out and disappears to the south and west. The "oil sands" of Pennsylvania from which have been taken many millions of barrels of petroleum, are of Chemung age.

The Chemung corresponds to part of the series of shales and limestones laid down in the Northwest Territory and Manitoba, Canada, probably to part of the Devonian strata that extend along the main range of the Rocky Mountains in Canada and to an unknown fraction of the great thickness of Devonian strata in Nevada. In Europe the Old Red Sandstone, a series of sandstones and shales estimated as possibly 10,000 feet thick, is in many respects like the Catskill group of the Chemung, and contains similar fossils. This great sandstone formation is found in South Wales, England, and Scotland, near the Baltic Sea in Russia, in Spitzbergen, and in Greenland.

The characteristic fossils of the Chemung Series in New York and Pennsylvania include, among land plants, tree-fern (*Calopteris*), and lepidodendrons. The fauna includes, among mollusks, brachiopods and lamellibranchs in great number and variety, no less than 252 species of lamellibranchs having been described from New York. Gasteropods are rare. Of vertebrates the Chemung contains remains of *Pterichthys* and other ancestors of the true fishes, including *Cocosteus*. The *Dipnoi*, or lung-fishes, a connecting link between fishes and amphibians, are represented by species of large size (*Dimictys*). Of selachians or sharks, but few remains are found. See CATSKILL GROUP; DEVONIAN SYSTEM; OLD RED SANDSTONE.

Chenab, chē-nób', in Hindustan, one of the five rivers of the Punjab. It rises in the Himalayan ranges of Cashmere, and entering

the Punjab near Sialkot, flows in a southwestern direction till it unites with the Jhelum; length about 800 miles. At Wazirabad it is crossed by a great iron railway bridge more than a mile long.

Chenavard, Paul Joseph, pōl zhō-zěf chā-na-vār', French historical painter: b. Lyons 9 Dec. 1808; d. 12 April 1895. He studied some years in Italy, and acquired a reputation by his picture of 'Mirabeau Replying to the Marquis de Dreux-Brezé.' After the revolution of 1848 he received a commission to paint large compositions for the decoration of the Pantheon. Among these are 'The Deluge' and 'The Passage of the Rubicon.' The Pantheon having been restored to the Roman Catholic worship, he was not permitted to finish the task.

Chénery, Thomas, English journalist and Orientalist: b. Barbadoes 1826; d. 11 Feb. 1884. He was educated at Eton and Cambridge. He was called to the bar, but was soon after sent out as *Times* correspondent to Constantinople, where he remained during the Crimean war. Afterward he was constantly employed on the *Times* staff until 1877, when he became its editor, a post which he filled till within 10 days of his death. As a singularly thorough Hebrew and Arabic scholar he had few equals among his contemporaries, and his translation of the Arabic classic, the 'Assemblies of Al Hariri' (1867), led to his appointment to a chair of Arabic at Oxford in 1868. He was one of the company of Old Testament revisers, and besides other works published an edition of the 'Machberoth Ithiel' (1872), a Hebrew version of the 'Assemblies.'

Chéney, Charles Edward, American clergyman: b. Canandaigua, N. Y., 12 Feb. 1836. He was graduated at Hobart College in 1857, and, after a course at the Theological Seminary of Virginia, was ordained a clergyman of the Protestant Episcopal Church in 1858. Becoming rector of Christ Church, Chicago, he incurred censure for heterodoxy and was tried on that charge and deposed from the priesthood. He at once became a leader in the Reformed Episcopal movement, and was consecrated bishop of the new denomination in 1873, a post he has since held, as well as the rectorship of Christ Church.

Cheney, Ednah Dow (LITTLEHALE), American writer: b. Boston 1824. She was married to Seth Wells Cheney (q.v.) in 1853. She has been president of the New England Woman's Club and the Massachusetts Suffrage Association. She has written 'Handbook of American History for Colored People' (1866); 'Gleanings in the Field of Art' (1881); 'Life of Louisa M. Alcott' (1889); and several stories, including 'Nora's Return,' a sequel to Ibsen's 'A Doll's House'; 'Sally Williams, the Mountain Girl' (1872); etc.

Cheney, John Vance, American poet and essayist: b. Groveland, N. Y., 29 Dec. 1848. He was librarian of the public library at San Francisco, 1887-94, and of the Newberry Library, Chicago, from 1894. He has published 'The Old Doctor' (1885); 'Thistle-Drift,' poems (1887); 'Wood Blooms' (1888); 'The Golden Guess,' a volume of essays (1893); 'That Dome in Air,' essays (1895); 'Queen Helen' (1895); 'Out of the Silence' (1897).

CHENEY — CHENOPODIUM

Cheney, Seth Wells, American engraver: b. South Manchester, Conn., 26 Nov. 1810; d. there 10 Sept. 1856. Upon the death of his father in 1829 he joined his brother John in Boston, where he entered the latter's profession, that of an engraver. A position in the Athenæum enabled him to study and work from casts and drawings, and he copied and engraved in 1832 Washington Allston's picture, 'Mother and Child,' which was afterward burned. In 1833 he studied in Paris in the atelier of De la Roche. His great power was in the expression of character in individual heads. He never attempted historical or genre subjects, and only rarely grouped two or more heads together. Engravings by him may be found in the following annuals. 'Gift of Friendship' (1848); 'Religious Keepsake' (1846); 'Religious Offering' (1840); 'The Token' (1832, 1836, 1837); 'Youth's Keepsake' (1831). See 'Memoir of Seth W. Cheney, by E. D. Cheney' (Bost. 1881), and S. R. Koehler's 'Catalogue of the Works of John and S. W. Cheney.' He was married to Ednah Dow Littlehale in 1853.

Cheney, Theseus Apoleon, American historical writer: b. Leon, N. Y., 16 March 1830; d. Starkey, N. Y., 2 Aug. 1878. His publications include 'Historical Sketch of the Chemung Valley' (1866); 'Historical Sketch of 18 Counties of Central and Southern New York' (1868); 'Laron'; 'Relations of Government to Science'; and 'Antiquarian Researches.'

Chénier, shā-nyā', Andre Marie de, French poet: b. Constantinople 30 Oct. 1762; d. Paris 20 July 1794. He went to France when very young, and entered the army, but left six months after to devote himself to literary pursuits. He was for about three years secretary to the French embassy at London, but in 1790 returned to Paris. Advocating the doctrine of a limited monarchy, he made himself equally offensive to the Royalist and the Jacobinical party. In consequence of his attacks on the Jacobins he was condemned by the revolutionary tribunal, and executed. Although but little known in his own day, Chénier has long been regarded as one of the finest French poets of his century, his chief characteristics being purity of form combined with vigor of thought and diction. He wrote idyls, elegies, odes (including one to Charlotte Corday), dithyrambs, philosophic pieces, etc. The maturity, breadth and soundness of his judgment in poetical composition are demonstrated by his poem on 'Invention.' Of the same year is his fine idyl 'Liberty.' Similar in spirit to this, and of perfect Pindaric form, is the 'Dithyrambic on the Tennis Play' (1791). In his prison of St. Lazare he composed a beautiful elegy, 'The Girl Captive.'

Chénier, Marie Joseph de, a French dramatist, younger brother of André M. Chénier (q.v.): b. 11 Feb. 1764; d. 10 Jan. 1811. He was a Jacobin, and member of the Legislative Assembly in the Revolution. His tragedies—'Charles IX.' (1789); 'Henry VIII.' and 'Calas' (both 1791); 'Caius Gracchus' (1793); and others—brought him fame and success by the accordance of their republican and revolutionary sentiments with the public opinion of the time, rather than by their merits as compositions. His national songs were approved by the best test of such productions,—popularity:

one of them, 'The Parting Song' (*Partant pour la Syrie*), is hardly less famous than the 'Marseillaise.' His satires are full of spirit, point and wit, but often rancorous and unjust.

Chenille, shē-nēl', a round fabric or trimming, made by uniting with two or more sets of warps, either by weaving or twisting, a fine filling or weft, which is allowed to project beyond the warps. This filling is cut at its outer edges, and the fabric is then twisted, assuming a cylindrical shape with weft projecting radically from the central line of warps. The name is applied, also, to lace, carpets, and cloth made wholly or in part from silk threads twisted or woven to resemble the tufted trimming of the same name.

Chenomorphæ, kē-nō-môr'fē, an order of desmognathous birds, first proposed by Huxley and nearly equivalent to the *Lamellirostrres* and *Anseres* (q.v.) of other authors. The palate is closed anteriorly by a thick bony bridge, but the vomer is well developed; the margins of the beak are more or less toothed; the tongue is thick and fleshy; and the down is uniformly distributed over the skin. All of the species are more or less aquatic; most of them are web-footed; and the young are precocial, or able to run from birth. Three very distinct families are recognized: the *Anatidæ*, or ducks, geese, and swans (qq.v.); the *Palamedeidæ*, or screamers (q.v.); and the *Phamopteridæ*, or flamingoes (q.v.).

Chenonceaux, shē-nôn-sō. See BLÉRÉ.

Chenopodiaceæ, kē-nō-pō-dī-ā'sē-ē, a natural order of apetalous dicotyledons, consisting of more or less succulent herbs or shrubs, belonging to about 80 genera and 600 species. They are mostly innocent weeds, but several, as spinach and beet, are employed as pot-herbs; others for the manufacture of soda. See CHENOPODIUM.

Chenopodium, kē-nō-pō'dī-ūm, or **Goose-foot**, a genus of plants belonging to the natural order *Chenopodiaceæ* (q.v.), of which it is the type, and distinguished by its hermaphrodite flowers, having five small green scales for the calyx, about five stamens, no corolla, and a fruit consisting of a membranous skin enclosing one black, flat, and shining seed. A number of the species have received the name of goosefoots, from a fancied resemblance to the webbed foot of the goose. The best-known or more remarkable species are:

1. *C. rubrum* (red goosefoot), a common annual, generally found in muddy ground. It has a leafy angular stem, which, as well as the whole plant, is often red. It bears a great number of black seeds, not larger than grains of sand, which are much fed on by birds, and seem to be relished by poultry.

2. *C. bonus henricus* (good King Henry, or wild spinach), a perennial, not uncommon in country churchyards, and places seldom disturbed. It has bright-green, broad, succulent leaves, which were in common use as spinach before the introduction of the present cultivated plant. The early shoots are sometimes used as a substitute for asparagus.

3. *C. quinoa*, the quinoa of Peru, a perennial inhabiting the high table-land of the Cordilleras, where, at the conquest of the Spaniards, it was the only farinaceous grain used as food. It is still

largely cultivated for its nutritious seeds, which are made into soup and bread, and, when fermented with millet, make a kind of beer. The plant is from four to six feet high, and has many angular branches, dull glaucous leaves, of a jagged triangular outline, on long narrow stalks, and flowers forming large compact branched heads, and succeeded by minute strong flat seeds, of a black, white, or red color. The quinoa has been introduced into Europe and is perfectly suited to the climate of England; but the grain has an unpleasant acrid taste, and will not be used as human food when anything better can be got. It is, however, an excellent grain for poultry, makes good green food for cattle, and, being of easy cultivation, may not be without economical value. Very large crops of seed have been grown in France.

In medicine *Chenopodium, ambrosioides*, var. *anthelminticum* is used very extensively as a remedy for the round worm as well as the tapeworm. The oil is the official part used, in doses of 5 to 15 drops, and it is a very efficient anthelmintic, particularly for the round worm, *Ascaris lumbricoides*.

Chen'owith, Caroline van Dusen, American writer: b. Louisville, Ky., 29 Dec. 1846. She has lectured on English literature and history, and is the author of 'Stories of the Saints' (1880); 'Child Life in China' (1882); 'School History of Worcester, Mass.' (1899).

Cheops, kē'ōps, the name given by Herodotus to the Egyptian despot whom the Egyptians themselves called Khufu. He belonged to the rulers who had for their capital Memphis; lived about 2800-2700 B.C., and built the largest of the pyramids. According to Herodotus he employed 100,000 men on this work constantly for 20 years.

Cephren, kēf'rēn, or Cephren, king of Egypt, the successor of Cheops and the builder of the second pyramid. The former is the form of his name as it is found in Herodotus, the latter is the name given to him by Diodorus. Herodotus informs us that his reign was in all respects as tyrannical as that of his predecessor, and that the Egyptians, animated by a feeling of hatred against these two kings, under whom they had suffered all kinds of oppression, and during whose reigns the temples had never been opened, avoided even the mention of their names; and hence, instead of naming the pyramids after their builders, named them after a shepherd called Philiton, who used the land in the neighborhood of the pyramids for pasturage. Diodorus adds that the pyramids were intended to serve as tombs for their builders, but as the people threatened to break them open and remove the bodies both the kings desired their friends to bury them in some spot where their bodies might remain undisturbed. Herodotus makes Cephren the brother of Cheops; but Diodorus says that Chembes, who is the Cheops of Herodotus, was succeeded by his son, Chabryis, who may perhaps be the same with the Cephren of Herodotus. His reign lasted 56 years.

Chepstow, chēp'stō, a town and port in England, county of Monmouth, on the Wye River, 14 miles north by west of Bristol. It is pleasantly situated on a slope descending gradually to the river, and has spacious, well-paved, and well-lighted streets. The principal edifices

are the church, a fine specimen of Norman architecture, and the old castle, the ruins of which crown a lofty cliff overhanging the Wye. The ruins of Tintern Abbey are in the vicinity. The building of iron steamships is actively carried on. The beauty of the environs is an attraction to visitors. Both the town and the castle are referred to in 'Domesday Book,' and the castle was the last English fortress to be besieged. Pop. (1901) 3,067.

Cheque. See **CHECK**.

Chequen, chēk'wēn, the leaves of *Eugenia chequen*, of the family *Myrtaceae*. A shrub of Chile and Bolivia, whose leaves are rich in volatile oil, and are used as a tonic expectorant in much the same manner as Eucalyptus.

Chequy, chēk'ī, Checky, or Chequered, in heraldry, applied to a field or charge when it is divided into squares like those of a chess-board.

Cher, shār, France, an inland department having on the north Loiret, east Nièvre, south Allier, west Indre and Loir-et-Cher, between lat. 46° 26' and 47° 38' N., and lon. 1° 50' and 3° 3' E., and formed of parts of Berry and Bourbonnais. It is named from the river Cher, which traverses it southeast to northwest. Area, 7,199.34 square kilometres, or 2,779 square miles; capital, Bourges. This department is included in the basin of the Loire, which forms the greater part of its eastern boundary. The surface is in general flat, but is diversified in the north by chains of inconsiderable hills. Soil various, but fertile in the neighborhood of the Loire and Allier. Heath and sand prevail in the northern districts. The forests occupy above a sixth of the area, and furnish large quantities of fuel for the iron-works, and timber for ship-building. Pastures extensive, and sheep very numerous. Grains, chestnuts, hemp, and wine are among the important products. The best wines are those of Chanignol and Sancerre. Beets, buckwheat, and flax are also grown. The minerals consist of iron, lithographic stones, good building and grind-stones, flint, marble, ochre, and potter's earth. The preparation and manufacture of iron, called Berry-iron, is the principal branch of industry. The manufactured articles are metal goods, fine and common cloth, woolen goods, porcelain and earthen-ware, sacking, beet-sugar, nut-oil, paper, and glass. The department is divided into three arrondissements, 29 cantons, and 290 communes. Pop. 347,725.

Cher, a river of central France, rising in Auvergne in the department of Creuse, and joining the Loire from the left near Tours; length, 220 miles. It is navigable to Vierzon. This river gives name to the department of Cher.

Cherasco, kā-rās'kō, (ancient CLARASCUM), Italy, a town in Piedmont, in the province of Cuneo, near the confluence of the Stura and Tanaro, 22 miles northeast of Coni. Its fortifications, once of great strength, were demolished by the French in 1801. It was repeatedly the object of contest between the French and Austrians in the wars of Italy, terminated in 1631 by a peace concluded here; and in 1796 Napoleon, by what is called the Armistice of Cherasco, obtained a free passage for his troops through the Sardinian states. The town is well built, and has several silk-mills. Pop. 3,500.

CHERBOURG — CHERKASK

Cherbourg, shār-boor, France, a seaport in the department of La Manche (The Channel), 196 miles west-northwest of Paris; on the north coast of the peninsula of Cotentin, and nearly due south of Southampton. It has a strongly fortified arsenal, and consists of the old or civil town, and the new or military (Port Militaire), the latter quite distinct from the former, and separated from it by the fortifications with which it is surrounded. Apart from its consideration as a naval station, Cherbourg is unimportant; it is the works by which it has been converted into a great naval fortress and place of arms that give it its special importance. These altogether have cost £8,000,000, and were chiefly carried out under Napoleon I., Louis Philippe, and Napoleon III. Foremost among them must be mentioned the *digue*, or breakwater, stretching across the entrance to the roadstead, which was formerly open to heavy seas from the north. It is more than two miles in length, of very massive construction, and consists of a western or longer and an eastern or shorter portion, forming at their junction a very obtuse angle pointing toward the north. There are a fort and lighthouse there, and, also, at either end. The breakwater alone cost about £2,700,000. The eastern entrance to the harbor, between the breakwater and the island of Pelée, is about 500 yards wide; the western entrance, between the breakwater and Fort Chavagnac (on a rocky islet), is about 1,000 yards, with a depth of 36 feet. It is the latter that large ships of war make use of.

The Port Militaire has three great basins for war vessels—an outer accessible at all states of the tide for vessels of the largest class; a floating basin communicating with this by gates; and a third communicating with both by similar gates. The aggregate water area of the three basins is about 56 acres, the depth of water being from about 30 to 50 feet. They have been excavated from the solid slate rock which forms the foundation of the entire dockyard, much of the excavated material being used in the construction of the breakwater. There are also slips for vessels of the largest dimensions, dry docks, building sheds, mast-houses, boiler-works, and in short everything necessary for the building and fitting out of ships of war. The numerous forts and other works with which Cherbourg is defended render it, if not impregnable from the sea, at least very difficult of attack. The commercial town has quite a modern aspect, the streets being generally wide, regular, well paved, and clean, but it is rather dull and uninteresting. There is an outer harbor, entered from the sea by a passage between two jetties, and an inner harbor or floating dock. The principal industry of Cherbourg is centred in the works of the dockyard, the commercial trade and manufactures being comparatively small.

Cherbourg is supposed to occupy the site of a Roman station, which is said to have borne the name of Cæsaris Burgum. Aigrold, king of Denmark, we are told, resided here about 945 A.D. William the Conqueror founded a hospital in it, and built the castle church. The English held possession of the place till about 1200. The castle, in which Henry II. frequently resided, was one of the strongholds of Normandy, and escaped the fate of the town, which, about 1295, was pillaged by an English fleet from Yarmouth; but it sustained afterward three memor-

able sieges, in 1378, 1418, and 1450. In 1758 the town was taken by the English without opposition, notwithstanding that the garrison was large. They kept possession of it eight days, destroyed the fortifications, carried off the artillery and the bells, and only retired after having exacted a heavy ransom from the inhabitants. The completion of the fortifications was celebrated by Napoleon III. in 1858, the festivities being graced by the presence of Queen Victoria. A statue of Napoleon I. was unveiled on the occasion. Pop. (1901) 42,952.

Cherbuliez, Charles Victor, shārī vēk-tōr shār-bū-lē-ā, French writer: b. Geneva 19 July 1829; d. Melun 1 July 1899. He belonged to a family noted for literary attainments. Having studied in the universities of Geneva, Paris, Bonn, and Berlin, he was for a time an educator at Geneva; but in 1864 became one of the editors of 'Revue des Deux Mondes.' He first gained distinction as art critic and observer of public affairs, as also by his writings, under the pseudonym G. VALBERT. He wrote a volume of art travels in Greece; 'A Horse by Phidias'; 'Political Spain'; 'Foreign Profiles'; 'Art and Nature'; etc. His works are characterized by clever treatment of the problems of domestic and social life and a fine psychological analysis, with a marked bias for description of odd characters. Among his most successful novels—and their success has hardly been less abroad than at home—are: 'Romance of a Respectable Woman' (1866); 'Ladislas Bolski's Adventure' (1869); 'Samuel Brohl & Company' (1877). The last two were dramatized, but won little popular favor on the stage. He was made a member of the French Academy in December 1881.

Cheribon, shēr'ī-bōn, Java, a province or residency on the coast toward the northwest of the island, between Krawang and Tegal. It was formerly an independent kingdom. It has a population of about 1,500,000. The productions are coffee, timber, cotton, areca-nuts, indigo, sugar, and also a little pepper. The rhinoceros is native here. The capital of the province, of the same name, is on the north coast, at the mouth of the river Cheribon. The houses are mostly of bamboo. The finest tomb in Java, that of Mulano, who introduced Mohammedism into the island, 1406 A.D., is near here. Population of the city, about 15,000.

Cherimoyer, chēr'ī-moi'ēr, the fruit of the *Anona cherimolia*, a plant of the order *Anonaceæ*, native of South and Central America, allied to the custard-apple. It is a heart-shaped fruit with a scaly exterior, and numerous seeds buried in a delicious pulp. Both flowers and fruit emit a pleasant fragrance. This fruit is now cultivated in various tropical regions.

Cherith, kē'rith, the name of a brook to which Elijah was sent during a portion of the years of famine (1 Kings xvii. 3-7), but the locality of which is no further designated than that it was before or on the face of Jordan. The most probable opinion is that it is to be sought for on the east side of the Jordan.

Cherkask, chēr'kask, or **Tcherkask**, two towns of Russia, in the government of the Don Cossacks, called Old and New Cherkask, or Staro-Cherkask and Novo-Cherkask. The former is on the right bank of the Don; the latter

CHERMSIDE — CHEROKEE

is 11 miles farther north, on a hill above the Aksai. Old Cherkask, a very ancient place, the foundation of which is attributed to a Greek colony, is situated on an island formed by the Don, the Aksai, and one of its branches, and is built on piles, as a protection from the inundations which continue from the beginning of April till the end of June. New Cherkask, founded in 1805, has a large cathedral and various other churches, elementary and higher schools, etc., and carries on a considerable trade. It is the seat of government of the Don Cossacks. Pop. 38,476.

Cherm'side, **SIR Herbert Charles**, English general: b. Wilton, Wiltshire, 31 July 1850. He was educated at Eton and entered the army in 1868, and after successive promotions attained the rank of major-general in 1898. He was with the Egyptian army, 1883-8; consul for Kurdistan, 1888-9; military attaché at Constantinople, 1889-96; and has been governor of Queensland from 1902.

Cher'okee ("uplanders," their own name; also rendered Tsaraki, Tsalaki, and Tsanaghi), the largest and most important Indian tribe originally east of the Alleghanies, perhaps the highest in culture and intellectual receptivity north of Mexico. They are of Iroquoian stock, though remotely, and are believed to be identical with the Tallagewi of Delaware tradition, a large tribe once occupying the Ohio and Alleghany valleys, till driven south by the Delawares and Iroquois. Their own tradition, that they came from the west and exterminated a certain "moon-eyed people," does not contradict this. The first white men who encountered them were those of De Soto's expedition in 1540. Our first definite information finds them located along the south—Alleghany and Appalachian ranges and the Piedmont region adjoining, from Virginia to Georgia and Alabama, a range about 120 miles square—and divided into two main branches speaking different dialects: the Otari Tsaraki or Atali Tsalaki (Upper Cherokees), whose main settlements were around the headwaters of the Tennessee and Cumberland; and the Erati Tsaraki or Elati Tsalaki (Lower Cherokee), centred in northern Georgia and southern North Carolina, around the headwaters of the Savannah and Chattahoochee. These location names, however, had become fixed tribal names, and persisted after the Upper Cherokee had been forced south into the region of the others. They were further divided into seven clans, forbidden to intermarry. Lying close to the stream of immigration in the southern colonies, they fill the most conspicuous place in the Indian wars, trade, and treaties of that section in the 17th and 18th centuries; and their chief southernmost town, Etowah, gave a name to the famous frontier fortress Ninety-Six (96 miles from it). At the beginning of the 17th century they are said to have had 64 towns and 6,000 warriors, the latter declining to 3,000 in 1769 and 1,500 in 1793; but the figures are very dubious. At any rate, they had many villages of well-built log-houses, and the Upper Cherokee were agriculturists, raising large crops of corn, beans, and pumpkins; the Lower were chiefly hunters. They sided with the English in the early colonial struggles, and in 1730 formally recognized the supremacy of the English king (though it may be doubted if they attached that

interpretation to their marks). In 1755 they ceded a large tract of land to South Carolina under Gov. Glenn, and Fort Loudoun was built in their territory, it is said by their own request. But after the reduction of Fort Duquesne in 1758, the slaughter of some Cherokees for horse-stealing set the whole tribe aflame, and they requited the massacre ten-fold. The folly of the then governor of South Carolina (Littleton) prevented an arrangement from being made, and a fearful Indian war desolated the borders till 1761, when the harrying of their lands for a month and the burning of 14 villages caused them to sue for peace. Their principal chiefs at this time were Attakullakulla or Little Carpenter, and Oconostota. In 1773 they made a large cession to Georgia.

In the Revolution, like most other Indians, they joined the English, their natural interests being against the Americans; and also like the others, their alliance won no victories for England, but helped lose her the country from the immeasurable odium it excited. Gen. Pickens at last subjugated them; and by a treaty at Hopewell, 28 Nov. 1785, they acknowledged the sovereignty of the United States. This was confirmed by that of Holston, in 1791, with a cession of territory; and other treaties and cessions followed in 1793, 1804, 1816, etc., ending 27 Feb. 1819. The United States on its part solemnly guaranteed to the Cherokees the possession of all lands not ceded by them, recognized their autonomy, and on 30 March 1802, authorized the President to expel trespassers, especially surveyors, by force. In 1790 a portion of the tribe emigrated to Louisiana; and others, mainly Lower hunters, later removed from time to time beyond the Mississippi, till in 1817 there were some 3,000 north of the Arkansas in the present Indian Territory. But the remainder showed an adaptability not equaled by any other Indians, and began a vigorous civilized career, which however only postponed their evil day for a few years. Two influences conduced to this besides their character,—the missionaries and the half-breeds: for almost alone among Indians, the mixture of white blood has prospered with the Cherokees. This blood, however, was singularly fine—that of the best Scotch families, in some cases noble: the Rosses, Adairs, McLeods, McDonalds, etc. After the rising of 1745 a number of these, irreconcilable or "wanted," emigrated to the Carolinas; in the Revolution, not unnaturally, they became loyalists; when it ended and a fresh outlawry menaced them, some of them and their sons pushed on into the Cherokee country, settled there, and intermarried with the native women. The Moravian missionaries had been working among the Cherokees from 1740, and had baptized a considerable number before the Revolution. In 1799 some of the tribe earnestly requested teachers and clergy. A great council was held at Tellico on the Tennessee, at which the Upper chiefs agreed to the plan, but the Lower dissented. In 1804, however, schools and missions were opened, a large part of the tribe were soon Christianized, and the sons of the chiefs attended the schools. The American Board worked successfully among them later.

The Cherokees were now perfectly peaceable, industrious, and rapidly growing civilized in the genuine sense; and they did good service to the United States in the War of 1812. In 1810 they

CHEROKEE

abolished the clan system and blood-feuds. In 1820 they organized a regular civilized government, including a legislature with paid members, and adopted a code of laws. In 1827 they took the name of The Cherokee Nation, and framed a constitution. In 1825 the Cherokee Sequoyah (q.v.) invented an alphabet of 85 letters, one for each sound in Cherokee, and it was officially adopted by the Cherokee government. In 1827 the first Indian press north of Mexico was established, and on 21 Feb. 1828 the first number of the *Cherokee Phoenix* was issued at New Echota, one-half printed in the new alphabet. But the nation's time had come, hastened by the discovery of gold, which they worked successfully. Georgia, on 24 April 1802, as consideration for ceding western lands to the United States, had stipulated that the Indian titles to lands within the State should be extinguished "as soon as it could be done peaceably and on reasonable terms." The government did its best, but found that it had promised the impossible. In 1808 both the Lower (hunters) and the Upper (farmers) sent deputations to Washington. The former expressed a desire to remove to the virgin hunting-grounds of the West, the latter to retain their own. The former, therefore, on 8 July 1817, were granted an exchange of lands to the West. This left about 5,000,000 acres of Georgia in the hands of the Cherokees, and 4,000,000 in those of the Creeks, or about 14,000 square miles in all, nearly a quarter the present area of the State,—the whole northwestern triangle above the line of Atlanta (which was Cherokee land) and Gainesville. In 1819 Georgia began to grow impatient, and memorialized the President to carry out the agreement of 1802. But the remaining Cherokees loved their beautiful and salubrious country, which they had covered with improvements; they had not much more in that mountain country than they needed; and the reports from Indian Territory were that their brethren were being badly harassed by the wild tribes of the plains. They refused to sell as a nation; by all Indian law, confirmed by the United States, no individual could sell, as the land belonged to the tribe; and to prevent sales they dared not disallow, the Cherokees in 1820 passed a law making such sale a capital offense in any member of the tribe. The Creeks duplicated this action in 1824. There was therefore no way for Georgia to rid herself of these two huge Indian states within her borders except by naked violence in defiance of United States treaties. She did so first with the Creeks, 1826–32, openly defying the United States, and proclaiming the separate sovereignty of Georgia (see CREEKS; NULLIFICATION); then in 1828–30 (see title below) passed laws extinguishing the government of the Cherokees and parceling out their land. The President (Jackson) would give no help, the supreme court said it could not; but the Cherokees clung desperately to their land even under the new legislation. Finally, on 29 Dec. 1835, a small fraction of the tribe, headed by a few influential men, were induced by an emissary of the United States to sign a cession of all tribal lands, in exchange for others in Indian Territory and the sum of \$5,700,000, and agree to entire removal within three years. This was of course perfectly invalid; the leaders were immediately assassinated, and were executed as bribed traitors. There is, however, no

reason to doubt their good faith to the nation. One of them was the still remembered Elias Boudinot, editor of the *Cherokee Phoenix*, who was educated at Cornwall, Conn., and married a Connecticut wife. They probably thought the nation could make better terms by yielding than by holding out. The bulk of the tribe, however, repudiated the treaty, and, refusing to go in 1838, were deported by an armed United States force, after a strong resistance and some bloodshed. Many hundreds, however, escaped on the march, lingered about in the woods, and finally concentrated near the Great Smoky Mountains in western North Carolina, where about 1,400, called the Eastern Band, still live, mainly in Swain, Graham, and Jackson counties. Of those who went, thousands are said to have died on the march or from resultant hardships. The number deported is unknown: probably between 10,000 and 20,000.

The chief of the tribe for nearly 40 years (1828–66) was the able John Ross (q.v.), or Kooweskoowee, a Scotch half-breed; and after fighting the removal to the last, when the crisis came he superintended it. When the tribe had gathered in Indian Territory it resumed its form of government and made Tahlequah the capital; and in 1845 resumed publication of a national paper, the *Cherokee Advocate*—which, however, was suspended in 1854, the present paper of the name dating only from 1870. The nation was doing well till the Civil War came for a blight. The Cherokees were almost equally divided in sentiment; their treatment by Georgia had been capped by that of the national government, and after all they were southerners by birth and industrial sympathies, and slaveholders. Each section furnished a large body of troops to its chosen side, and in consequence each side in turn ravaged the country as a hostile land, and with the consideration usually shown by whites to Indian property; and the land was almost swept bare. After the war they made a new treaty with the United States, freeing their slaves and admitting them to full citizenship in the tribe; and in 1866 they absorbed the remnant of the Delawares. Since then their land has been opened up by railroads, despite their protests. The case of *Cherokee Nation v. Southern Kansas Railway*, 1889, decided that the United States had right to grant eminent domain through their territory, and in fact four trunk lines traverse it. In 1892 they sold their great western extension, known as the Cherokee Outlet, and it forms the larger part of northern Oklahoma. Their region is the whole of Indian Territory north of the Arkansas. Their present government is by an elected principal chief, and a legislature with two chambers. But their long struggle for national existence is drawing to a speedy close. The open policy of the United States government is to substitute allotment in severalty for tribal ownership as fast as possible, and put an end to the anomaly of independent tribes with a figment of sovereignty which only makes hardship to government, tribe, and innocent outsiders alike. No tribe is better fitted for it than the Cherokee; generations of good living and civilization have not only tamed and elevated the Indian character in them, but greatly modified even the Indian physiognomy; there are scores of full-blooded Indian ladies in Tahlequah scarcely distinguishable from whites save for duskiness of

CHEROKEE NATION V. GEORGIA—CHERRY

skin. A thorough system of public schools among them has been one of the chief instrumentalities in refining both face and character at once. Their number in Indian Territory in 1900 was 25,639; but the Cherokees proper in this enumeration are thought not to be much above 20,000.

Cherokee Nation v. Georgia, the classic case (1831) on the relations of the Indian tribes toward the United States government. (For the preliminary history, see **CHEROKEE**.) The means taken by Georgia to oust the Cherokees were as follows: By six successive acts, from 20 Dec. 1828 to 22 Dec. 1830, Georgia laws and jurisdiction were extended over all inhabitants of the Cherokee territory, and resistance to her writs made indictable; Cherokee laws, usages, legislative assemblies, and courts were abolished, and execution of their writs prohibited; Cherokees were declared incapable of testifying against or making contracts with white men, but the execution of the Cherokee laws against selling land to white men was punished as murder; their lands were ordered surveyed and distributed by lottery among the citizens of Georgia; their improvements and gold mines were confiscated; and white men were forbidden under penalty to enter their country, without a license from the governor and taking the oath of allegiance to Georgia. The Cherokees appealed at once (early in 1829) to President J. Q. Adams, to make good the government's treaty guarantees; but he, as his term was about to expire, left it to Jackson, who, as an old Indian fighter, sympathized with Georgia, refused to interfere, and advised the Cherokees to submit or remove. Their next resort was to the supreme court, but the Georgians took care not to let suits in the State courts come to a decision, and so give opportunity to appeal. At length, however, a case was found. When the Georgia authority over the Cherokee country became operative in 1830 a Cherokee named Cornstassel or George Tassels killed an officer serving a writ of ouster, and was sentenced to be hanged; a writ of error was obtained from the supreme court 12 Dec. 1830, citing the State to appear; the legislature instructed the State officials to ignore it, and the sentence was carried out. The Cherokees' council then applied to the supreme court for an injunction to prevent Georgia from exercising her laws within the Cherokee country; the State put in no appearance, and the case was decided from the arguments on the other side: These were: that the supreme court has jurisdiction over cases between States of the Union and foreign countries; and that the Cherokee Nation, by repeated acknowledgment of the United States in solemn treaties, was such a foreign country, sovereign and independent. Chief Justice John Marshall for the court—Story and Thompson dissenting—decided that they were not a foreign nation in the meaning of the Constitution,—since, for example, an attempt by any other foreign nation to form a connection with them, or to trespass on their land, would be held an invasion of the rights or territory of the United States; that they were a domestic or dependent nation, in a state of pupillage, their relation to the United States being like that

of a ward to its guardian, that their title to their land was only that of occupancy, the United States succeeding to it whenever their own possession lapsed; that their appeal lay to the President; that the supreme court could not call out force to resist the extension of Georgia laws over territory claimed as its own; that it could pass on the title to land, upon suit properly brought, but this question was a political one.

A second case, though not cited under this head, properly belongs with this. Under the law restricting white men's entry into the Cherokee country, 10 missionaries and others were arrested and sentenced to four years' imprisonment, in September 1831. Eight were released on making submission; two refused; and one, Rev. Dr. Worcester, brought suit for a habeas corpus in the supreme court, which gave decision in March 1832, and to the lay mind appears to have reversed its former one. It held that all the acts of the Georgia legislature with respect to the Cherokees were unconstitutional and in violation of the treaties and laws of the United States; and ordered the prisoner released as condemned on a void statute. The State refused to comply; but in place of waiting till the next term of the supreme court, to see if it would call on the United States authorities to enforce the decree, the prisoners made submission and were released. It is probable that Jackson's famous "John Marshall has made his decision—now let him enforce it," would have prevented them from regaining freedom till their term was up.

Cherry, the name of various species of trees and shrubs of the genus *Prunus*, natural order *Rosaceæ*, closely related to the almond, peach, apricot, and plum, thus comprising one of the most important groups of fruits—the drupaceous or stone fruits. Cherries are characterized by white flowers usually in umbel-like fascicles, or in racemes, and sub-globular, mostly red, yellow, or black fruits, without bloom, and containing stout, nearly globular smooth stones. Few of the native species have attracted horticultural attention except for ornamental purposes, but some, especially the wild black cherry (*P. serotina*), are highly prized as cabinet woods and for interior house-finishing.

The cultivated cherries have been derived almost wholly from two European species, *P. avium*, and *P. cerasus*. The varieties of *P. avium* belong to four groups: mazzards, inferior seedlings common in the eastern United States; hearts, heart-shaped, soft, light or dark, sweet fruits; bigarreus, heart-shaped, firm, light or dark, sweet fruits; and dukes, light, somewhat acid fruits. Of these four groups, the bigarreus are the most important; they are largely grown in California and shipped to the eastern markets. The hearts are somewhat grown for home on both the Atlantic and Pacific coasts, in Europe, and in Australia. The varieties of *P. cerasus* are divided into amarelle (light-colored) and morello (dark-colored) groups. The morellos are the leading acid cherries and are most popular in the eastern United States, especially in western New York, where they are largely canned for market, as well as shipped in the fresh state.

CHERRY—CHERRY VALLEY

Besides these important species and their varieties, a few others have horticultural value, notably, *P. mahaleb*, a hardy, rather small European species, which is used as a propagating stock; *P. pennsylvanica*, the pin, wild red, or bird cherry, whose hardness seems to promise usefulness in the Western plains region; *P. besseyi* and *P. pumila*, the sand or dwarf cherries, which seem to grade into one another, the former producing sweet fruit, the latter acid, and which, being natives of the plains region, seem worthy of the attention of the hybridizer.

Cherries are propagated by budding upon either mazzard or mahaleb seedlings, the latter being in more general favor, especially in the West, because they are hardier, easier to grow, easier to bud, and are freer from blight in the nursery. Sweet cherries succeed best upon well-drained light loams where the moisture is abundant, but not excessive; sour kinds will stand heavier, but not wet land; neither prove profitable upon very rich soils. The ground should be thoroughly and deeply plowed and harrowed; the sweet kinds, which are large spreading trees, set 25 to 30 feet part, and the sour kinds 15 to 20 feet. The land should be kept clean by frequent cultivation until mid-summer, when a clover crop should be sown. This must be turned under the following spring, and the land treated as before. Each year liberal applications of potash and phosphoric acid should be given and the trees protected from the attacks of insects and fungi by systematic spraying.

Two insects are most dreaded. One is the cherry aphid, which attacks the foliage in May. It is particularly troublesome upon the sweet kinds. Kerosene emulsion and fish-oil soap are each useful in controlling the pest. The other is the cherry slug, a shiny, dark-green worm, the larva of a four-winged black fly. The slug eats the soft tissue of the leaves between the veins. It may be controlled with air-slaked lime or arsenites. See FUNGICIDE.

The most important diseases of the cherry are brown rot, leaf-blight, and black knot, which are treated under PLUM. Mildew (*Podosphaera oxycanthæ*) is troublesome upon nursery stock. It is a gray fungus which causes the leaves to fall, but may be controlled by a fungicide. Consult: Bailey, 'Cyclopedia of American Horticulture' (1900-2).

Cherry, Wild, the bark of *Prunus serotina* collected in autumn. This is very extensively used in medicine as a vehicle basis, the syrup of the bark being used very extensively in cough remedies. It contains a small amount of hydrocyanic acid.

Cherry-laurel (*Prunus lauro-cerasus*), a shrub closely allied to the common cherry, but having evergreen leaves. It was introduced into Great Britain in the 16th century, and is well known as an ornamental shrub. It yields the celebrated laurel-water. This is a powerful poison, the strength of which (like that of peach-kernels, bitter almonds, cherry-leaves, etc.) depends upon the presence of prussic acid. Laurel-water is obtained from the leaves and flowers, or the leaves only, by distillation. This shrub is often called the common laurel, another evergreen species being distin-

guished as the Portugal laurel: both are distinct from the true laurel.

Cherry Valley, Massacre at. The site of this village, in Otsego County, N. Y., was made memorable by the scenes of 11 Nov. 1778. With the exception of the massacre at Wyoming in July previous, that at Cherry Valley was the greatest of those indiscriminate murders of peaceful settlers which inflamed American fury without much diminishing American resources, and loaded England with odium while not advancing her military success. It was led by Lient. Walter N. Butler, a Mohawk Valley Tory leader, son of the more famous Col. John Butler. He had been captured at German Flats in the summer of 1777, while misusing a flag of truce to incite the inhabitants of the then Tryon County to desert the patriot cause; was sentenced to death as a spy, but unfortunately spared on the intercession of friends, carelessly guarded, and escaped, burning for vengeance on Tryon County. He selected Cherry Valley, a well-known frontier settlement, as the point to strike; because its noted beauty, and the unusual cultivation and morality of its inhabitants, would make the blow resound. Lafayette, seeing its exposed situation, had fortified it with a blockhouse the preceding spring; and Col. Peter Gansevoort, an experienced officer of high reputation, solicited the command. For some reason, however, it was given to Col. Ichabod Alden, a respectable Massachusetts officer, not used to Indian warfare. During the summer the inhabitants lived in the fort and went warily; but by November they had returned to their dwellings. On the 8th Col. Alden received a message through a friendly Indian that at a great meeting of Tories and Indians at Tioga it was resolved to attack the place; and the people begged to take refuge in the fort again. Alden pooh-poohed it as an idle Indian rumor, assured them that he would guard against a surprise, and sent out scouting parties. The party that should have beaten up Butler's went to sleep by a camp-fire on the night of the 9th, and awoke as prisoners of the enemy. Butler had obtained a company of his father's rangers, induced Brant, the great Mohawk chief, to join him, with a few hundred of his Indians, picked up a band of Senecas and other straggling Indians and Tories as he went on, and with about 700 men approached Cherry Valley. Securing from the prisoners, under threat of torture, all information as to the conditions there—as that the officers of the garrison lodged with families near the fort, instead of in it—the expedition camped about a mile southwest of the village on the night of the 10th. It snowed in the night, turning to rain in the morning. As the enemy approached under cover of the thick mist, an Indian fired on a stray settler and wounded him, but he escaped and warned the colonel. That remarkable officer thought the assailant only a straggling Indian, and paid no attention. The rangers stopped near the village to examine their guns, and the Indians sprang forward, the ferocious Senecas in advance, under their chief, Sayenqueraghta, and with them some Tories worse than themselves. In the massacre that ensued, 32 settlers, mostly women and children, besides the colonel and 15 other soldiers, were slain; 30 to 40 prisoners were taken,

also nearly all women and children; and the village was reduced to ashes. Most of the prisoners, however, were released the next day, and sent back; not, probably, from any motives of humanity on Butler's part, his hot temper and hard nature making him as cruel as the Indians, but to effect an exchange for his mother and younger brothers and sisters, in the power of the Americans. The massacre was long charged upon Brant as chief actor, but it is now known that he commanded only his own Mohawks, and kept them in hand, his object being to destroy the fort and garrison, and that the Senecas committed most of the horrors. It fact, it is notable that the only deed of humanity that day was done by a Mohawk sub-chief, and that the worst atrocity was perpetrated in cold blood by a Tory, who was afterward hanged for it.

Cherso, kër'sō, a long, narrow island, in the northern Adriatic, belonging to Austria, yielding wine, olives, and other fruits. It is situated on the Gulf of Quarnero, between Veglia and the mainland, and forms part of Istria. It is about 35 miles long, and the area is 105 square miles. The town of the same name stands on the west coast, and has a population (1890) of 4,725. Pop. of island (1890), 10,180.

Chersonesus, kër-sō-ně'sūs (Greek, a peninsula). This name has been given to several peninsulas, as (1) the Cimbric Chersonesus, now Jutland; (2) the Taurian Chersonesus, the peninsula formed by the Black Sea and the Sea of Azoff—the Crimea; (3) the Thracian Chersonesus, the great peninsula in Thrace, now the peninsula of the Dardanelles; (4) the Golden Chersonesus, in India beyond the Ganges, supposed to be the Malay Peninsula.

Chert, a crypto-crystalline (not visibly crystalline) variety of quartz closely related to flint, but less translucent and having a more splintery fracture. In geology the term is applied to a considerable range of siliceous rocks, from the impure flints largely formed from the siliceous remains of organisms, sponges and diatoms, found in limestones and other stratified rocks, to the jasperated quartz formed by the alteration of limestones or limy sandstones. Cherts of this last type grade into jasper. See FLINT; JASPER; QUARTZ.

Chertsey, chës'sī or chërt'sī, England, a town in the county of Surrey, 20 miles southwest of London, on the Southwestern Railway, is pleasantly situated on the right bank of the Thames, over which there is a handsome bridge, connecting it with the north or Middlesex side of the river. The houses are mostly of brick, and in general well built. The church of St. Peter has a square embattled tower, and contains a tablet to the memory of Charles James Fox. A school was founded here by Sir William Perkins in 1725 for clothing and educating 25 girls and 25 boys. It is now converted into a public elementary school. There was here formerly a monastery of the Benedictine order, in which Henry VI. was interred, and where his remains lay until removed to Windsor by Henry VII. The chief industries are manufacturing iron, engineering, boat- and steam-launch building, carriage build-

ing, and cabinet work. Vegetables are cultivated for the London market. Chertsey gives name to a parliamentary division. Pop. (1901) 12,762.

Cherub (plural, cherubim), a celestial spirit which, in the angelic hierarchy, is placed next in order to the seraphim. All the several descriptions which the Scripture gives us of cherubim differ from one another, as they are described in the shapes of men, eagles, oxen, lions, and in a composition of all these figures put together. The hieroglyphical representations in the embroidery upon the curtains of the tabernacle were called by Moses (Ex. xxvi. 1) cherubim of cunning work.
